STATE LIBRARY.

No. 81366

*When, from whom, and how this volume was obtained,
with the price paid, if any, may be found opposite
the above number in the Register of Books,
which is always open to inspection.*

Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books, or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

 The foregoing Regulations will be strictly enforced.

SAN FRANCISCO, SATURDAY, JANUARY 4, 1890.

The Regan Vapor Engine.

An ever-increasing demand by the mechanical world for concentration and economy in motive-power has directed the attention of many inventors to the importance of the subject, with varying results. The most successful to which the attention of the PRESS has been called is that of the Regan vapor engine, invented and patented by Mr. Daniel S. Regan, a well-known mechanical engineer of this city.

As shown in the engraving, this is a simple compact upright engine, and is operated by means of vapor drawn into the cylinder by the action of the piston and there exploded by an electric spark. A galvanized iron tank (the carburetor) contains a small quantity of gasoline; this is connected with the engine through any reasonable distance by means of a pipe. At each revolution of the fly-wheel a current of air is drawn through the carburetor and into the cylinder. In passing through the carburetor it vaporizes a quantity of gasoline, which united with more air drawn through the pipe and an air valve, forms the explosive charge, the explosion of which upon combustion develops the power.

The electric spark which produces the com-

fect safety by any intelligent man or boy. The engine is clean and comparatively noiseless and no license is required. Full power is developed at once, and when it ceases to run all expense stops. The cost of running is about one cent per horse-power per hour, where gasoline is used.

Where ordinary illuminating gas is available,

hand saws, coffee-mills and roasters, polishing machines, fanning machines in restaurants, sewing machines, ventilating apparatus, emery wheels, mining and milling machinery. Particular attention, also, is being given to lannohes and small boats of all kinds, either for business or pleasure, engines specially adapted to these

LAUNCH OPERATED BY REGAN VAPOR ENGINE.

THE REGAN VAPOR ENGINE.

the connecting pipe can be attached to the meter, producing equally as good results.

Its compactness, lightness and cheapness especially commend it for such purposes as electric lighting, pumping, running elevators, har-

ness being built to order on short notice, and of any required horse-power. Its advantages in this connection are many.

A corporation with ample capital has been organized for the purpose of manufacturing the

ness circles: Francis Cutting, president; W. E. Miller, vice-president; Sanford Bennett, treasurer; Henry P. Dimond, secretary and manager; Daniel S. Regan, superintendent. The company occupies a commodious building

EXTERIOR OF A TYPICAL NICARAGUA HOUSE—See page 3.

hustion is controlled by a very simple mechanical device, automatic and never-failing in its action. The simple in construction is the Regan vapor engine that it can be operated with per-

vesting and threshing machines, printing presses, boot and shoe machinery and hoisting machines. In fact, it can be used anywhere that power is needed, as for circular, jig and

vapor engine, hulls for lannohes, irrigating pumps, etc., known as the Regan Vapor Engine Co. It is composed of the following named gentlemen, well and favorably known in busi-

ness circles: Francis Cutting, president; W. E. Miller, vice-president; Sanford Bennett, treasurer; Henry P. Dimond, secretary and manager; Daniel S. Regan, superintendent. The company occupies a commodious building

CORRESPONDENCE.

Mines of a Rainless Land—No. 2.

Iquique and the Silver Mines and Salt-peter Deposits.

[Written for the Press by "DON JUAN."]

In my last letter (page 448 of Dec. 14th) I gave you a description of the port of Iquique. In this one I will take you through some of the famous silver mines of "Huatajia," situated on the high mesa, some 3000 feet above the city of Iquique and about nine miles in an easterly direction from that place. It was on a warm October morning that I started as a guest of the American Vice-Consul, Mr. Rosenstock, with him and his engineer, Mr. Philipp, for my first visit and inspection of those mines. We started (on horseback, of course) about 4 o'clock in the morning, so as to escape the greatest heat of the scorching sun, which in this shadeless and windless country comes down mercilessly upon the traveler. The low beach upon which Iquique stands is about two miles wide, at the termination of which the greatest hardship of your short journey commences. Now you are obliged to ascend the "crest" of the mesa, and in the short distance of less than two miles you are carried something like 2000 feet nearer heaven, over a very rough and narrow trail, when you finally stand upon the seemingly level and endless mesa. From this point of observation a grand and magnificent panorama spreads itself around you. Looking east, your eyes sweep over the great mesa and foothills of the "Cordilleras de los Andes;" but the eyes do not rest here, for you also behold the Andes themselves in all their grandeur, and especially at this time of the morning is the scene a grand one, for just now the sun creeps over the mountain, its golden rays thrown against this always blue sky. The blue waters of the Pacific, just at our feet, make a thoroughly grand picture not soon to be forgotten.

From our temporary observatory, with the aid of our glass, we see the great mountain and volcano Sabana, rising to an altitude of 22,000 feet above sea level, and even Sorato, 21,286 feet, and Illimani, 21,224 feet, are visible. Giving still greater scope to our imagination, we turn our eyes further to the north and see old Misti from an elevation of 20,000 feet looking down upon us. And now we throw one look back upon the city at our feet and behold Iquique still lying in darkness below, for the sun is not high and near enough to let its rays be felt here, but far, far out to sea, many miles, we see the waters of old ocean already sparkling in sunshine. Surely a strange panorama—darkness here and sunshine there. But I think we have dreamed and admired long enough. Our horses, too, seem to have enjoyed the scenery and rest and are ready to start again.

We now make a straight line for our objective point, La Mina, St. Augustine, about one mile this side of the village of Huatajia. This large property was formerly owned by the American vice-consul, Mr. Rosenstock, who, two years ago, organized the St. Augustine Mining Co. with 12,000 shares at \$1 each, which were selling at the time of my visit, Oct. 7, 1887, at \$3.60 each. The shaft of this mine is down about 300 feet. The first 150 feet the country rock passed through is a very hard porphyry, which is the cap rock of the whole surrounding country. Usually the lodes are very poor in this formation, the thickness of which varies from 10 to 300 feet. Below this is found the limestone in which we find in this locality our richest metal.

From this 300-foot (the main shaft of the St. Augustine) extend levels in both directions from 50 to 600 feet in length, and considerable stopping has been done. The lode is about eight feet wide, runs nearly east and west, and has an inclination of about 41 degrees. The value of the ore runs from \$20 per ton to pure silver (plata blanca) of which sometimes large blocks have to be cut up with chisels. The ore is hoisted by (Malacator) horse whim and sent by cart to the Iquique mills, where it is reduced. The output on the ore for this short distance of eight or nine miles is 40 cents per cental. The St. Augustine employs from 80 to 120 peons (miners), who are watched over by a corps of some 25 Europeans, chiefly English and German.

Other prominent mines in this camp are the San Pedro and San Pablo, the Decubridora, the Margarita and many others; what has been said of the St. Augustine holds good for all of them with the exception of the San Pedro and San Pablo, which is the richest in camp. It is owned by Mr. Chase, also an American, who came to this coast some seven years ago—a poor sailor and is now worth about \$20,000,000, all of which he has made out of the above mine, of which he is the sole owner. I saw, myself, at this mine a block of native silver weighing a little over eight centals. Just think of it, a piece of solid silver just as it was taken out of the mine, over 800 pounds! But these rich nuggets of silver are common occurrences in all the great mines of the district.

About one mile below these mines is located the town of Huatajia. It is very old; the church is said to be 200 years old and I do not doubt it, for you can put your finger anywhere

through the rotten boards. The tower leans off to the south at an angle of about 30 degrees. It is as famous a piece of architecture in this part as the great leaning tower of Pisa. The mystery is that it has withstood so many storms and the earthquakes which are so common in these regions. Huatajia has about 1000 inhabitants, nearly all of whom follow mining for an occupation. From Huatajia it is about seven miles south to Santa Rosa, which, next to Huatajia, is the most productive mining-camp of Tarapaca. Of this I will tell you in my next.

Mines on Railroad Lands.

EDITORS PRESS:—Never since the beginning of time was there a greater fraud perpetrated, or attempted, than the getting of these mineral lands by the C. P. R. Co. These lands which we have mined for 40 years, and from which have been taken out untold millions of gold, are now claimed by this R. R. Co. as "agricultural." The fact is, there is little or no agricultural lands this high in the mountains, and for some miles below this. I will admit that there are some lands here that might be made agricultural by the application of manure and water in sufficient quantities—and the same might be said of the Great Sahara Desert. I know of small tracts of land in this vicinity that were cultivated in early times, that have now been abandoned for more than thirty years, and have grown up with young pines as large as a man's body; and this, too, where the parties so cultivating had an abundance of free water for irrigating purposes. Only think of it—in this township, 13 north, Range 11 east, M. D. B., less than a quarter-section is in cultivation all told, and more than half of this is for horticultural instead of agricultural purposes—less than 160 acres out of 23,040—rather a bad showing this, for the agriculturist; and yet these lands have been as free and open to the agriculturist as to the miner, for forty years.

It is a well-known fact to most miners that in this mineral belt of California, which is 30 or 40 miles in width, there is a small belt, say six or eight miles in width, which is much richer than on either side of it, and it is right here in this rich belt that the R. R. Co. has lately made application for 30,000 acres of agricultural land. These lands, when surveyed, were returned as mineral, and, as I said before, we have been mining them for 40 years; and now, if they are not mineral, I will unhesitatingly say there is none such in California.

It is high time Congress took hold of this matter and legislated upon the subject, and not only prevent this R. R. Co. from getting any more of these lands, but compel them to give up those already fraudulently obtained.

If our statesmen at Washington have any doubts as to the mineral character of this part of California, let them appoint and send out a commission to investigate the question. Have them ascertain if it is the even-numbered sections that are mineral, and from which the gold (if any) has been taken; and if the odd-numbered ones are agricultural, as the R. R. Co. claim they are.

If this should prove to be the case it will certainly be a phenomenon worthy the attention of all scientists.

We miners are now more hopeful that justice will be done us than we have been for a good many years past.

We think now that we have a Secretary of the Interior who is Noble in more than one sense. May he last. J. W. EDMONDSON.
Volcanoville, El Dorado Co., Cal.

Oregon Quartz and Placer Mines.

EDITORS PRESS:—Your correspondent met Mr. Gordon, well known in Healdsburg, Cal., who reports some valuable discoveries on the head-waters of the Sixes and its tributaries in the northern part of Curry county, Oregon. Mr. Gordon shows rich specimens of gold-bearing quartz from Sucker and Johnson's creeks in Coos county, where he and his partner, Mr. Hayes, have staked out claims that they intend to work as soon as the weather permits. Mr. Gordon also showed me a specimen of native copper, samples of which have been assayed two or three times, proving to be 95 per cent copper.

The Devilbiss brothers, the discoverers of quartz mines on Johnson's creek, are working their mine and are very much encouraged at their prospects, getting free gold and rich quartz. There are a number of good placer mines being worked lower down on Johnson's creek, and on Sucker creek also. Mr. More is working a hydraulic mine on Salmon creek, also a tributary of the South fork of the Coquille river in Coos county.

Others, who have prospected on the south side of Johnson's mountain, report good prospects and have found gold in paying quantities. There has also been considerable placer mining along the west fork of Cow creek, in Douglas county. Prospectors who have been through that section declare that valuable mines are quite likely to be developed along that creek.

Another Californian, who has traveled the past two summers over Douglas and Coos counties, claims to have discovered a coal mine and a petroleum spring in Camas valley, near the divide between Coos and Douglas counties.

Mr. Gorsline, of Roseburg, has opened a coal mine, located fourteen miles west of this place, that yields a good quality of coal for fuel, and the vein is four feet or more in thickness. Not far from this mine is a spring having indications of petroleum.

The Roseburg papers publish the news of a preliminary survey that has been made to see if water can be brought from the East Umpqua into the Myrtle creek placer mines. The survey proves the scheme to be a feasible one. The proposed ditch will be about twenty miles long, or by making two tunnels the distance can be shortened four or five miles. The canal or ditch will be eight feet wide on top, five on the bottom and carry two and a half feet of water.

These placer mines were formerly worked and were remunerative when plenty of water could be obtained, but should the mining fail, the water can be used for power and for transporting lumber made from the timber growing near, to Myrtle creek, a station on the O. & C. R. R.

I was shown several rich specimens of gold quartz found near the head of the East Umpqua by an old miner, who also showed a rich specimen of native copper found in the same section.

I hear that the quicksilver mines above Oakland have been shut down, owing to the low price of that metal.

Croppings of chrome ore and other metals suitable for paint have been found in several places.

It is claimed by those who have traveled over the different ranges that the mineral belt extends for two hundred miles along Rogue River range, continuing northward in the Cascades.

There is no doubt that enterprise and capital will reap rich rewards if they will develop and thoroughly work the mineral resources of the county, proving that these ranges and their spurs were not made in vain or merely as obstructions to travel and settlement of the county.

E. E. DEMING.

Assessment of Mining Corporations.

EDITORS PRESS:—As we are a little dull on some subjects, that is, cannot see them in the light they are carried out here, I would like to hear from some more intelligent minds on one subject, that in the end I may receive more light.

This subject is, the assessment by our county assessor of mining corporations, at the value of their improvements, and leaving the stock of the corporation unassessed. This appears to be right only in some cases, as I see it, as where they are not dividend-payers. But take the big mines that have net dividends in the year to the full amount of their assessment—is not the stock of such corporation assessable? Has it not the value of a note bearing the same amount in interest? Has it really no value apart from the property? We will take for example a mine here that pays \$5 per share per month, making \$60 per share net, equal to \$600 at 10 per cent, or, in other words, the mine referred to pays dividends to equal ten per cent on \$1,800,000, and is assessed in the sum of about \$240,000. Is that property assessed in proportion to its cash value?

A HAYSEED SUBSCRIBER.

Grass Valley, Nevada Co.

[A former assessor of this city informs us that he assessed the incorporated companies as follows: He assessed all the improvements and then took the aggregate value of the stock at its market value for one or more shares on assessment day, and from this he deducted the improvements, etc., already assessed, and the remainder he assessed as the value of the franchise. This manner of assessing was declared valid, so that the Spring Valley Water Company, mining and other incorporated companies paid in full the taxes due from such assessment. This, it appears, is the only way in which an incorporated stock company can be legally and successfully assessed to its full value.—Eds. Press.]

GLAZED BRICKS are now largely used for both interior and exterior decorations. They are manufactured in Philadelphia and elsewhere in the United States. For this purpose, an ordinary light-colored or red brick is used, and a suitable enamel is produced on the surfaces to be exported. Some colors are very easily obtained. A simple lead glaze on a cheap buff brick makes a good yellow. A manganese and iron glaze is used for black. White and blue are the most difficult to produce, since the red color of the brick must first be hidden by an opaque layer of white before the finishing glaze is applied. Green must be made in the same way.

A NOVEL ENGINE.—A decidedly novel and simple engine is manufactured at Kalamazoo, Mich. It dispenses with piston-rod, crosshead and ways, and is claimed to reduce friction to the lowest possible point. It has an oscillating piston sustained in a journaled bearing, and turns about one-fourth of a revolution to each stroke of the engine, the only friction outside of the shaft to which the rock cranks are attached being a slight pressure on the packing strips to keep it steam-tight.

Calaveras County Notes.

Situation.

The northwest corner of the county is 36 miles southeast of Sacramento city, while the southwest corner is within four miles of being on a direct line east and west with San Francisco. The Mokelumne river on the north divides the county from Amador, while the Stanislaus river separates the county from Tuolumne on the south. The extreme northeast corner joins Alpine. On the west, San Joaquin and Stanislaus counties join Calaveras, making Calaveras almost a triangle 54 miles in length northeast to southwest, and 32 miles across its western border. The county contains 622,000 acres.

Altitude.

The lower plains, from Copperopolis across to Milton, Jenny Lind, Valley Springs, Comanche, Barson and Wallace, average about 400 feet above sea level. Carson, Angels, Vallejo, Douglass, San Andreas, Altaville and El Dorado, 1500 feet. Murphys, Mokelumne Hill, Sheep Ranch, Cave City and Railroad Flat are 2000 feet, while West Point, in the extreme northeast corner, is 2700 feet.

Water Supply.

The melting snow from the lofty Sierra Nevada mountains in the eastern part of the county, pours down a continuous stream of sparkling water, filling the Mokelumne river on the northern boundary and the Stanislaus on the south, thus holding the county in a water embrace, while the Calaveras, San Antonio, Indian Creek, Jesus Maria, the forks of the Mokelumne river and innumerable smaller streams fill every gulch with their limpid streams. Throughout the entire foothill region are many springs pouring out from five to 200 inches of water from nature's hidden reservoirs. Added to these sources of supply, free from nature's board, are the numerous systems of canals, the result of the county's mineral wealth. The early miner found the rich placers of the county extending far up the gulches on the mountain-sides, and when he had reached the summit the mountain proved but an old river-bed, filled with rich gravel, elevated by some three of Nature in her volcanic age. To reach these deposits with water and to give that water the desired fall for pressure, ditches were constructed, which took out the water from the mountain streams at higher altitudes and conveyed the water thence along the summits of the mountains to the mining-fields. Where the streams failed in furnishing a steady supply, great reservoirs were constructed. These ditches are to-day the factor which, in the summer months, causes the hill and valley to blossom as a rose in the hands of the horticulturist, while the mining interest shows a greater degree of activity and prosperity than at any time since the days of old, the days of gold, the days of '49. On the southeast the Union Water Co.'s 90 miles of ditches take 10,000 inches of water from the north fork of the Stanislaus. In addition, their reservoirs hold in store an amount of water sufficient to supply 500 inches a day for 12 months. From these sources of supply their ditches lead to and cover all that portion of the county from Esmeralda on Indian Creek, on the north, to Robinson's ferry on the Stanislaus, on the south, and Murphys, Douglass, Vallejo, Altaville, Angels, Albany Flat and Carson in the center. When needed, this system can be extended to Copperopolis, thus covering the entire southern border. Joining the Union on the north is the Table mountain ditch, taking its 500 inches of water from the San Antonio and conveying it to Sheep Ranch; also the Idea ditch, covering 25 miles of country as it flows to El Dorado, Cave City, Old Gulch, San Andreas and vicinity. The south and middle forks of the Mokelumne cover the country between Railroad Flat and West Point, the middle fork carrying an average of 1000 inches. The Blue lakes, with a capacity of 10,000,000,000 gallons, empty into the south fork of the Mokelumne river, while the north fork has a natural reservoir that can be made to hold 8,000,000,000 gallons of water, more than sufficient for the wants of San Francisco. This system was at one time surveyed for that purpose.

The Clark ditch controls this unequalled system of water-supply, taking its water from the south fork of the Mokelumne, near the Calaveras big trees. It extends thence west over a belt of country 22 miles in width, covering Railroad Flat, Glencoe and Rich Gulch, a stretch of country 32 miles long. When needed, this system can be extended to cover all the county from Valley Springs and Jenny Lind to Mokelumne Hill with a supply of 100,000,000 gallons a day, or, as one time intended, all Oakland, Alameda and San Francisco. Here is water without limit, only waiting for capital to carry its crystal stream to the water-thirsty citizens of San Francisco. Joining this system on the extreme north is the West Point ditch, taking its 400 inches of water from the middle fork of the Mokelumne river at a point six miles east of West Point and conveying it thence to West Point and vicinity. Following the Clark ditch into the valleys is the Mokelumne & Campo Seco Canal and Water Company's ditches. One ditch takes 1000 inches of water from the south fork of the Mokelumne river, 2½ miles northeast of Glencoe; the next, 300 inches, seven miles southeast of West Point; the third, 250 inches, three miles

south of Railroad Flat. Their reservoir near Railroad Flat supplies in addition 200 inches of water for three months. This extensive system of ditches covers and will supply Mokelumne Hill, Campo Seco, Valley Springs, Burson, Wallace and Comancha. Following this is the Laucha Plana and Poverty Bar ditch, taking its water from the main Mokelumne river at Italian Bar, covering Campo Seco, Comancha and Wallace. From this point water will be piped to Clement's, Lockeford, Lodi and Stockton in the adjoining county of San Joaquin. At low-water tide this ditch has 1200 inches of water without reservoirs. Six reservoirs are being constructed, and when completed will give the ditch 5000 inches of water.

Near Milton is the extensive reservoir of the Spring Valley Water Co., covering Milton and all the land below that point. The location, course and extent of these great water systems prove that Calaveras is unequalled in her natural and supplied means of water-supply for all purposes, not only furnishing water to irrigate every foot of good land in her own limits, but having a surplus sufficient for all the plains and cities to San Francisco. In her mountains, reservoirs can be constructed of sufficient capacity to store more water than can possibly be used for years to come. As water is recognized as the great essential in fruit culture, Calaveras may justly claim to have laid her foundation as a fruit county, broad and deep, only awaiting the coming of the experienced fruit-grower to place her in the same front rank with Placer county, the advantages of Calaveras being similar in every respect.

Timber Belt.

The west line of the timber belt begins near Murphys and crosses northeast to West Point; it extends thence east and north to the northeast line of the county, embracing an area of 100 square miles. The vastness of this territory and the wonderful size of these giants of the forest call forth exclamations of surprise and admiration from all who visit this unequalled timber reserve. Many who criticised Horace Greeley when he in his lectures proceeded to show by calculation the vast amount of lumber that could be cut from one of Calaveras county's

Mr. Carty's mill, at West Point, 250,000 feet; Clark's New Era mill, near Glencoe, 500,000 feet. These mills, as a rule, are below the main timber belt. In the belt proper a vast amount of the choicest pine is each year worked up into shakes and palings, while the cedar is made to furnish the ranchers of the valleys with most desirable posts. There is no way of accurately estimating this output, but the large number of teams constantly coming down from the mountains with their bulky loads of shakes and posts prove the extent of this industry. The wood-chopper plies his trade along the lower border, while the charcoal-burner and contractor for mining timber and laggings is

field; sufficient to say that the mineral belt crosses Calaveras county. From the Copperopolis copper mines, on the plains, to West Point, in the mountains, the clatter of the stamp-mill is heard in almost every ravine, while the hydraulic giants still pour out their powerful streams against the ancient river-banks. To Calaveras belongs the honor of giving to the world the largest nugget of gold found in the United States, which was found in November, 1851, at Carson Hill. It weighed 195 pounds troy, with a valuation of \$43,534.

In addition to the numerous gold mines of the county are large hodiea of copper and iron

ing these monsters of the forest. Year after year a steady stream of tourists from our own and foreign lands has visited these wonders until their fame has become as household lore. These *sequoias* are growing about 15 miles northeast of Murphys, and are reached by a daily line of stages. In the center of the grove is located the commodious hotel of the owner of the grove, Mr. J. S. Sperry. In this section all varieties of trees attain an immense size, baring giants in themselves. Sugar pines 275 feet in height with a diameter of ten feet are not uncommon. The size of the surrounding trees has a tendency to dwarf the greater *sequoias*, but when their measurements are taken and the

MAGNOLIA AVENUE, RIVERSIDE, CAL.

A SOUTHERN CALIFORNIA SCENE.

sequoia, thinking he should have confined himself to a description of their majestic beauty, would find themselves naturally falling into the same train of thought, "How many homes can be erected from these monarchs?" "Who can estimate the number of the millions of feet contained in this belt?" The yellow and sugar pine lead in quantity; then follow the spruce, fir and black oak, while the Calaveras grove of "Big Trees" is a forest in itself of *sequoia gigantea*. Tapping this timber on its western border are a number of small sawmills, situated in the ravines leading down from the mountains. John Manuel and McKay Bros. are stationed near the big trees. Manuel's mill has a capacity of 15,000 feet a day of ten hours; McKay's, 25,000 feet a day. C. Crossgrove's portable mill near Murphys cuts 10,000 feet a day; Wiggins' mill on Jesus Maria creek cut 600,000 feet in the season of 1888; Woodcock's mill, near West Point, 800,000;

working steadily up into the belt. By reason of its situation the greater portion of this timber reserve will remain untouched until the railroad penetrates these forests and reduces the cost of transportation to a market sufficient to consume the lumber output of this section. The present market is that of the county alone, which is supplied with lumber at an average price of \$15 a thousand feet. A V-flume, with feeders extending into the different sections, would deliver the greater part of this timber at any desired point in the valleys. Water and sufficient fall for flumes can be secured.

Mineral Wealth.

Calaveras has lost none of her old-time prestige, but is forging ahead. Her mining industries are in a far more prosperous condition than at any time since the days of '49. Space will not permit even an abbreviated account of the extent of the territory and the richness of the

ore. The eastern portion of the county is one vast granite quarry. Between this granite and the slate of the foothills is a section of limestone extending across the county. Black and white marble, steatite, and other valuable building stones are in large supply. Lignite coal, gypsum, and roofing slate, fossils and petrifications can be had for the digging. By reason of the activity in mining, the county has in her mining towns a home market where double the prices can be obtained over those paid in the cities.

Population.

The population in the mining towns is increasing very rapidly, making it difficult to estimate it, but 12,000 will not exceed the number in the county at this time.

Scenic Attractions.

"Calaveras Grove of Big Trees."—Mr. John Bidwell of Chico claims the honor of discover-

space measured on the home lawn, far removed, their size seems incredible. In the north and south groves nearly 1400 *sequoias* are now growing, while numerous fallen monarchs are found at every hand. Through one of these fallen trees the writer rode on horseback for a distance of 200 feet. The Pioneers' Cabin allows the passage of a loaded coach through its base, while far above, its limbs wave their salutation. The New York, with its diameter of 35 feet and height of over 400 feet, will give the stranger an idea, by comparison, of the wonders of the grove. On one stump four sets, or 32 dancers, can trip the light fantastic toe, the diameter being 25 feet. "Smith's Cabin" has an interior of 16 by 22 feet, while the tree, despite its hollowness, extends 340 feet heavenward. "Old Goliah," his neighbor, has fallen, and his 105 feet of circumference and length of 261 feet, mark him a fallen giant.

Scenes in Southern California.

We give on this page photo-engravings of scenes familiar to all dwellers in the southern part of our State. The palms, orange groves, low verandaed house and general nature of the vegetation, sufficiently indicate the semi-tropical latitude of the locality. To the dwellers in the high northern latitudes of our State, nothing could more convincingly indicate its infinite variety of climate than pictures of the snow-crowned, cloud-capped mountains and the hardy vegetation of oak and fir on the one hand and the level, far-reaching vistas of citrus groves, frond-like vegetation and clear skies on the other. Magnolia avenue, Riverside, San Bernardino county, is one of the picturesque and famous drives of that beautiful city. The growth and development of this famous city is one of the marvels of even this marvelous age and country. Less than a generation ago, within the memory of people still young, the place now covered with churches, schools, stores, beautiful mansions, and all the evidences of culture and the highest civilization, was a wilderness whose greatest utility was thought to be in providing sustenance to a herd of sheep. But the mountain streams, which ran to waste and ended their useless career on the plains below, were tapped, their waters utilized, the wilderness was made to blossom as the rose, and taste and skill and irrigation made possible such scenes as those here presented.

THE English Board of Trade reports 509 strikes during 1888, with 83,000 strikers.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Dec. 28: The water has been taken out of the Lincoln mine, and work is again being prosecuted, and the mill has been started. Mr. Stewart hopes to be able to run without further interruption.

FATAL ACCIDENT.—Another fatal accident occurred at the Kennedy mine on Christmas eve, the victim being James G. Macdonald. He was working his first shift at the mine, having come from Eureka, Humboldt county, a few days before. He had previously worked to the mill, however, and when the mill suspended went to Humboldt county and engaged in the lumber business. On his return here, he remarked that there were so many cripples in that section, owing to accidents in connection with sawmill and logging business, that he thought he would rather take his chances to the mines. On going to work on the fatal evening, he was sent to the 600-foot level to do something with the water tank, and while engaged in this he fell into the shaft, falling to the water, over 400 feet. The body was soon recovered, but, of course, life was extinct.

El Dorado.

GOOD PAY.—Georgetown *Gazette*, Dec. 29: Judge Edmundson was down from Volcanoville during the snowstorm. He and Mr. Nye have been taking out some good pay this winter from their lavacapped gravel mine.

Inyo.

FISH SPRINGS MINES.—Inyo *Independent*, Dec. 27: There are five mining prospects at Fish Springs. Elliott and "Doc." Grabam have opened up a ledge of gold ore that will pay well. Henry Melone and C. F. Fuller have developed a fine ledge that gives from \$50 to \$80 per ton to gold and there is said to be enough in sight to give them both a "good stake." Commetti, an Italian miner, worked 20 tons a week or so ago that netted him \$800. All over the district old ledges of good paying ore are being found and all can be very easily worked. All the ledges opened so far are by tunnels and two men can work a ledge that may pay them well. Supplies of all kinds can be easily got; there is plenty of water and a fine farming country close to the mines. The distance from the town of Big Pine is but six miles and the locality is one of the pleasantest in Owens valley.

MINE SALE.—Over at Fish Lake an old prospector named Kincaid has lately sold two mine locations for \$15,000. The buyer is Andy Fyfe, a well-known mining man. Kincaid has been prospecting in that locality for many years; he is now getting old, but this sale will give him enough to live the rest of his days in comfort. The ore in the mines carries silver and lead. Beyond any doubt there will be a good deal of activity in mining about Fish Lake the coming spring. The district is just over the California line, in Nevada. Most of the farm products and beef used in the district will be obtained in Owens valley to the neighborhood of Big Pine.

Napa.

MINERAL PAINT NEAR CALISTOGA.—*Calistogan*, Dec. 29: The mining and refining of mineral paint found in this vicinity may develop into a business of great importance and value, judging from recent transactions. James H. Safley, whose residence is on the Knights valley road, four miles from Calistoga, has been aware during the past three or four years that an immense deposit of red mineral paint was on his property, and he has occasionally shown specimens at home and abroad, thinking that perhaps they might attract while come under the eyes of appreciative persons; but not until lately has the paint created sufficient interest on the part of any one to make an investigation. During several days past, parties have had samples in San Francisco analyzing and making experiments, and the result has been so very satisfactory that, to make sure the paint will not pass into the possession of others, they have bonded, for a term of six months, 560 acres of Mr. Safley's land, and paid him a certain amount of money in hand. As soon as the weather will permit, operations will be commenced to ascertain the extent of the deposit, and if it comes up to the expectations of the San Franciscans as to extent and quality throughout, the land will be paid for. Then extensive refining works will be constructed, and the work of mining and refining engaged in extensively. It is said by those men who are first-class judges of red mineral paint, that the Safley paint is superior to any other they have seen. As to the question of quantity, Mr. Safley says there is very little or no doubt that it is all that can be desired, as he has often been over the ground and examined it closely, the deposit being of large proportions.

Nevada.

THE WASHINGTON MINE.—*Transcript*, Dec. 25: Another big bar of gold bullion was shipped to San Francisco this week from the Washington mine, which property is getting better and better with each day's work done on it. Work is being prosecuted in all four levels. The 20-stamp mill is pounding away without interruption on ore that pays about six dollars a ton, and the sulphurets which are saved yield over \$100 a ton. Owing to the size of the ledge, the complete equipment of machinery and the fact that it is run by water-power, the total cost of mining and milling averages but \$2.75 to each ton of ore produced, leaving a profit that ought to satisfy anybody. The upper level has been driven 1260 feet and has three pay shoots, the first extending 322 feet on an ore body two feet wide, the second 73 feet on a seven-foot body, and where the third is being raised 900 feet from the entrance to the level the ledge has widened out to 16 feet. On the second level the shoot now being stoped from shows a length of 200 feet and a thickness of 10 feet. The third level is being driven through pay ore to a point 180 feet ahead to connect with a winze from the second level. In the fourth level and close to the shaft the ore body is eight feet thick. With the arrangements now under way the Washington will be one of the best ventilated mines in the county, and as Under Sheriff Reynolds says, "good ventilation is one of the important requisites of successful mining."

MINING DIVIDEND.—*Grass Valley Union*, Dec.

29: The North Star Mining Co., of this district, has declared a dividend (No. 5) of 50 cents a share, amounting to \$50,000, payable on and after the 30th inst. This will make \$250,000 in dividends paid by the new company.

OUT OF SUPPLIES.—*Transcript*, Dec. 29: At the IXL mine on the south fork of Poorman's creek, there is a scarcity of provisions for the men and of shoes and dies for the mill, all on account of the big storm which has prevented getting these things over the road from the base of supplies to the mine. The scarcity has necessitated a temporary laying off of most of the force, but everybody will be at work again as soon as some "grub" can be taken over from Washington, which is five miles this side. The mine itself is all right. Men who have worked there say it is going to be a great producer by next summer when everything gets fairly under headway. They report that the ledge varies in thickness from 10 to 30 feet and has an average width of 17 feet. They say it mills over \$10 a ton as far as tested. If a ledge of that size and as easily extracted averages \$6 a ton, there is a fortune in it for the owners.

A GREAT MINE.—"The Idaho mine of Grass Valley is a great property, but let me tell you that the California mine of Graniteville bids fair to make just as good a record," said a mining man who recently visited some of the claims in Eureka township. The California has a very large ledge of ore that is richer than the most extensive deposits and as the ledge is followed it is improving in every way. Supt. Foley, who is in partnership with Mr. Bohannon owns the property, keeps persistently but quietly turning out the riches. He doesn't say much, but he wears a contented expression that cannot be misinterpreted.

THAT RE-ORGANIZATION.—*Tidings*, Dec. 26: A recent proposed re-organization of the Brunswick Mining Co., operating in this district, the following explanations are made: The holders of the judgment against the company are to receive the entire capital stock of a new company to be organized under the laws of California for their judgments against the present company, at the rate of \$25,000, or five cents per share paid (still leaving 95 cents per share assessable). The holders of the entire capital stock of the new company agree to exchange share for share of the old for the new on the payment by the old of five cents, and the money received from the voluntary assessment on the old, less expenses, to be donated to the new company for the development of its property. All lapsed stock goes to judgment holders. The entire capital stock of the new company is to be deposited with H. R. Lounsbury, New York, until Aug. 1, 1890. Up to this time only the judgment holders' stock will be traded in, the object of pooling the entire capital stock being to prevent the throwing of large blocks on the market and depressing prices.

ANOTHER BIG DIVIDEND.—*Tidings*, Dec. 30: The North Star M. Co., operating in this district, has declared dividend No. 5 of 50 cents a share, aggregating \$50,000. This makes \$250,000 in dividends paid by the North Star under the present management. And this mine was shut down years ago, "worked out!" Yet it has within three or four years been reopened, supplied with a hoisting and pumping plant and 40-stamp mill second to none in the State, in addition to paying a quarter of a million in dividends! Between 150 and 200 men are given employment. The Empire, Omaha and Hartley are also shining examples of "worked-out" mines.

COE MINE.—*Grass Valley Union*, Dec. 31: The owners of the Coe mine received no information yesterday from Mr. Craig, of Deervo, who has a bond upon the property which expires to-day, and they were of the opinion that he would not comply with the terms of the bond, and that they will again take possession of the property. In that case it will not be long before arrangements will be made for conducting regular operations in the mine, and in the meanwhile the pump will be kept going to prevent the mine filling with water.

TWO BITS A PAN.—*Transcript*, Dec. 27: The workmen digging to bedrock to make a foundation for the north abutment of the new Main street bridge have struck gravel that pays two bits to the pan. Along about 1860, John Williams, grandfather of ex-Postmaster Wallace J. Williams, ran a tunnel in north from Deer creek at about that point and drifted out considerable gold. He had to quit before the deposit was worked out, because of the sinking of Maio street which was overhead. The Manzanita ravine which now has its dumping-place farther east came down that way in early times, it is supposed, the theory being that the point where the Union hotel, Lane's livery stable and adjoining buildings now stand was once a low flat and subsequently filled up with the natural wash. There is a chancel of pay gravel even as high up as a few feet over the ground upon which the undertaking establishment of W. C. Groves stands.

OMAHA MINE.—*Grass Valley Union*, Dec. 31: Everything is going on satisfactorily at the Omaha mine, except that the bad weather has interfered with the putting down of the water-pipe line to the Lone Jack shaft for hoisting purposes. As stated several days ago, a splendid body of ore is showing up in the No. 10 and No. 11 drifts, which from its size promises to give permanent and profitable results. The Omaha has about reached the point where dividends can be paid, but they are postponed for the present, owing to the expenditures being made for surface improvements.

Placer.

IOWA HILL.—Cor. Placer *Argus*, Dec. 28: The latest news from all the mines in this vicinity and on the Upper Divide is encouraging. Fair & Davis have 35 meo at work on the Pioneer quartz mine, near Damascus, and keep 15 stamps running most of the time on rock that gives good dividends to the owners. A lower tunnel is being run to cut the ledge at a greater depth. C. Hoffman reports about 40 men at work at the Red Point mine taking out gravel that must pay well if Mr. Hoffman's good spirits are any indication. Chas. F. Reed, owner of the Drummond quartz mine at Cottage Home, passed through town on Friday last on his way to the mine. About 25 meo are now at work and the force will be doubled during the spring. The Huntington mill crushes from 25 to 30 tons per day with good results. Mr. Reed is well pleased with his investment in Placer county. The famous old Mountian Gate gravel mine at Damascus has been bonded to the same French syndicate that owns the Red Point mine. The Mountain Gate has been one of the richest mines on the Divide. Enough of the old

blue channel still remains unworked to warrant the new owners putting in pumping machinery, or to run a new and lower tunnel to drain the mine. The French company have abundant capital to do either, and have intelligent engineers in their employ who will bring back the old Mountain Gate to its former position as one of the best paying mines in Placer. It is rumored that the same company have bonded other claims in the same vicinity on which work will be commenced in the spring. Ross Browne, the mining engineer, has been surveying and taking the levels on rim rock and channels on the Forest Hill Divide, and it would not be a surprise if you should hear that the French syndicates had got hold of some of the rich gravel mines in that district. The Morning Star gravel mine, at Iowa Hill, has been bonded to a company represented by Mr. J. Hammond, who is at present working the mine under his bond. The main tunnel is being driven ahead 500 feet; when that work has been completed a larger force of men again be put to work taking out gravel and the mill again be run on full time. E. West has charge of the work. Tom Dick and the Schmidt boys are running a tunnel on the old McCall mine at Elizabeth tow. They have started an upraise and expect to break through before New Year's. They have christened the claim the Emma mine. The Huntington mill at the Horman mine, at Wisconsin Hill, is crushing 12 to 15 tons of rich gravel per day. Another mill is on the way to the mine, but it will not get there before spring unless the roads improve.

SUNNY SOUTH.—Cor. Placer *Republican*, Dec. 25: Five miles from Michigan Bluff at the head of a tributary of El Dorado canyon lies the little town of Sunny South. It depends entirely upon the Hidden Treasure mine for its existence, but since it is "built upon a rock" no one is apprehensive as to its future. The Hidden Treasure mine has been worked for about 13 years and is now operated through 8300 feet of tunnel, through a slate formation, by drifting. The pay gravel is white quartz. The bedrock is slate varying in color from white to black. The mine is timbered throughout with spruce and pine. The gravel is washed by water supplied by the mine. The cars are drawn into the mine by horses, and as the cars come out of the mine loaded their contents are dumped through a chute to the washing floor, where they are washed into sluices by a stream of water under a pressure of 20 feet. After being washed the gravel passes through two sets of sluices lined with quartz boulders and worn-out car wheels. Considerable quicksilver is used in the sluices.

Shasta.

OLD DIGGINGS.—*Redding Free Press*, Dec. 23: S. O'Neil of Old Diggings informs us that he has a contract to run the main tunnel on Haskell, Meyers & Co.'s mammoth mine. Also that the Hart & Day mine is running 15 stamps and shipping a carload to Vallejo Junction every week.

A SUCCESS.—*Shasta Courier*, Dec. 26: John Bowder has made a success in his management of the old Banghart mine on Mad Mule creek, nearly \$3000 having been taken out in a few months. If there was a good supply of water on that claim a carload of gold could soon be extracted.

Siskiyou.

SALMON RIVER ITEMS.—Cor. Yreka *Journal*, Dec. 25: The weather was quite cold on the evening of the 15th inst., the mercury reaching 20 above zero, the coldest of the season. The snow ranges from six inches to a foot deep on the river bars, and is disappearing rapidly under the influence of the hot sun. On the mountains the snow is six or seven feet deep. The placer miners are getting ready for business in the spring, when nearly all baying claims will make good wages. The Golden Ball quartz mill is working 12 stamps, one battery being buog up for repairs. The ore crushed at present is the best milled in this district for a long time. The more the mine is developed the better showing it makes. Rollin & Co., with two arastras, frozen up at present, have plenty of ore on the dump to grind as long as water lasts, which good judges say will average not less than \$100 per ton. Sheffield's quartz-mill has not been started yet. He expects to start up soon, with 200 or 300 tons of ore, which prospects very well. Ex-Lieut. Gov. Daggett is prospecting the Black Bear mine with a fair chance of bringing it up to its old standard. Ned Roberts has found a good ledge about one mile above the Golden Ball on Eddy's gulch. It is said he has, ore to sight in the tunnel that will yield \$2000 per ton. Bully for Ned! Harry Welker & Co. have a fine prospect below Tanner's Peak. They have run 40 feet to the ledge and find good-paying ore all the way.

PLACER AND QUARTZ.—*Yreka Journal*, Dec. 25: From Koon Nothing creek we learn that the quartz mines are all turning out exceedingly well, with prospects of improvement as the various ledges are more fully developed. The Gold Run mine of Radefinger & Co. pays from \$60 to \$80 per ton, and employs from six to eight meo in the mine and mill. The Koon Nothing mine has been yielding very good pay, and the mill is kept running steadily. The Wolverine mine has been shut down for the present, owing to the ledge being too wet to work to advantage. As soon as it dries out after the heavy storms, work will be resumed again. The cold weather since the late storms freezes the ground and checks the flow of water, to prevent much work at placer mining, but when a change to warmer weather occurs, there will be an abundance of water, owing to the extensive supply of snow on the mountains. The frequent warm spells during winter will give miners a better chance this season than for many years to mine successfully, and in the spring they will be favored with a still better chance of doing well. The hydraulic mines will also have an abundance of water to run several weeks longer during the spring and summer, as the snow already on the mountains will be sufficient to last until midsummer, with a certainty of considerable more snow during January and February to pile up an additional amount. Radefinger & Co. have built a fine new ditch at their mine on Koon Nothing creek, which will enable them to run their quartz-mill all year round. They expect to start the mill again in March, when the new ditch will be ready for constant use. The Centennial Co. are pumping out their claim again, since being filled up by the heavy storm of two weeks ago, and have all the water out except about 10 feet. The boys do not entertain much hope of being able to mine during the winter, but concluded it would do no harm to start up the

pump run by the water-power of the river. Should no great storms occur hereafter to raise the river, they may be able to start working again in taking out gold, provided the weather does not get cold enough to freeze the water in the pit.

NEVADA.

Washoe District.

GOULD AND CURRY.—*Virginia Enterprise*, Dec. 28: On the 200 level the southwest drift has been extended 20 feet; total length, 250 feet. Formation, soft porphyry. On the 400 level west crosscut No. 2 has been extended 38 feet; total length, 138 feet. Formation, quartz.

BEST AND BELCHER.—On the 625 level east crosscut No. 1 has been extended 28 feet; total length, 78 feet. Formation, porphyry and clay, with streaks of quartz. On the 1000 level east crosscut No. 1 has been extended 15 feet; total length, 56 feet. Formation, hard porphyry.

ALTA.—Are still sinking the winze in the ledge below the 925 level. The stopes between the 825 and 925 levels are looking well, and the mill reduces daily about 45 tons of ore. Have just made a large shipment of concentrates to Salt Lake City.

YELLOW JACKET.—Are shipping an average of 60 tons of ore daily to Brunswick mill. The west drift on the 500 level is out 880 feet; face in porphyry. Crosscutting east and west from north drifts on the 800 and 900 levels.

HENDRICKS.—The hoisting machinery has been thoroughly repaired and is now as good as new. Work will be resumed in the shaft when the roads are again opened.

JUSTICE.—The 825 level north drift, advanced 17 feet during the week; total, 115 feet; face in fair-grade ore. The north drift, 622 level, is out 470 feet, the face in low-grade ore and showing some moisture. The 490 level stopes are looking and yielding about as usual. Shipped to the mill during the week 247 tons of ore; average battery assays, \$22.62.

KEYES MINE.—Proprietorship in a chaotic condition.

OCCIDENTAL.—Too much gypsum.

SAVAGE.—Are extracting ore from the 400, 500, 600 and 750 levels. During the week 455 tons of ore have been milled, the average battery assay of which was \$21.58. Have bullion on hand and at the mill amounting to \$22,315.50.

HALE AND NORCROSS.—They are extracting ore from the 500, 600, 700 and 1200 levels, and also from the 1300 level upraise. During the week have milled 1078 tons of ore; average battery assays, \$19.13. Have bullion on hand and at the mill amounting to \$49,467.24.

SCORPION.—On the 500 level the new east crosscut from the south drift was advanced 56 feet; total, 256 feet; face in porphyry, showing streaks of quartz.

CHOLLAR.—The north lateral drift, 750 level, is out 744 feet; face in quartz and porphyry, giving low assays. The north lateral drift, 930 level, is out 365 feet; face in porphyry.

POTOSI.—Timbering the south lateral drifts on the 650 and 750 levels is nearly completed. The east crosscut, 560 feet north of shaft, 930 level, is out 166 feet; face in porphyry.

EXCHEQUER.—The 500 level east crosscut on the north line is out 46 feet; face in quartz and porphyry.

NEW YORK.—Owing to repairs being made to surface machinery, very little work has been done in the mine the past week.

ALPHA.—The west crosscut 100 feet north of shaft, 500 level, is out 373 feet; face in porphyry. The north lateral drift, 600 level, is out 62 feet; face in quartz, giving low assays.

SILVER HILL.—The 260 level east crosscut, 790 feet north from shaft, advanced 15 feet through porphyry; total distance from shaft, 875 feet. North-east crosscut, 430 feet from shaft, advanced 15 feet through porphyry and clay; total distance from shaft, 480 feet.

WARD COMBINATION SHAFT.—East drift on the 1800 station is out 113 feet; face in porphyry.

JULIA CON.—The northwest drift from the 1800 Ward station is out 131 feet; face in clay and porphyry.

CHALLENGE CON.—The joint Confidence and Challenge west crosscut from the 300 level is out 86 feet, 20 feet having been added during the week. The face shows a mixture of quartz and porphyry.

CROWN POINT.—The 600 third floor northeast drift is out 64 feet. Shipped to the mill during the week 847 tons of ore, the average battery assay of which was \$17.67 per ton.

BELCHER.—The 1200 level No. 2 east crosscut was extended 67 feet during the week, making its total length 370 feet. The 200 south drift is out 123 feet.

OVERMAN.—Extracted 185 tons of ore and shipped 205 tons to the Vivian mill.

CALEDONIA.—At a point 313 feet in the south drift have commenced west crosscut No. 3 and extended the same 38 feet. Formation, vein porphyry.

CON. IMPERIAL.—West crosscut No. 2 from the 300 level north drift is out 60 feet, having been advanced 20 feet during the week. The face shows a mixture of quartz and porphyry. The north raise from the same level is up 70 feet, 14 feet having been added during the week. The top is in low-grade quartz.

Columbus District.

CANDELARIA.—Cor. Ioyo *Independent*, Dec. 27: There is a rumor in camp that the Candelaria Mill & Water Co. has bought the Holmes and Northero Belle properties. Mr. Sunderland is now his way from New York to San Francisco; he is the manager of the C. M. & W. Co. It is said that Mr. Westerville, the resident superintendent, has demanded the possession of the Holmes from Mr. Girard, the agent for the Holmes. Mr. Girard says the Holmes is sold but he has not received orders to turn the property over to the new owners. There are over 100 Chioamens working at Columbus for the Pacific Salt and Borax Co. They ship about 500 tons of borax per month. Teals Marsb has also started up. The Mt. Diablo will shut down for a week to give the men rest and overhaul the machinery at the hoisting works. Their mill at Sodaville is running on ore from the Columbus Con. mine. Thomas Harrington, formerly with Given & Ingalls, of Bishop, is foreman of the Columbus mine. Considerable chloriding is being done on the Potosi, the property of T. Reddy, and other claims. There

are 14 men working on the Garfield mine. Mr. Hooper, the superintendent, has gone to London and it is understood that on his return they will put on about 30 men. If the Holmes is sold there will be considerable money expended here. Mr. Sunderland has ordered the resident superintendent to examine the Holmes and send him a report to San Francisco what the probable cost will be to put the Holmes property in good working order and what it will cost to get out 30 tons of ore per day.

Eureka District.

ADAMS HILL MINES.—Eureka *Sentinel*, Dec. 28: Some of the mines on Adams Hill we learn are looking well. There are seven tributaries working in the Silver Lick, all of whom are making good wages. Frank Roose is getting some good ore out of the Rio Members. Wm. Sanchez is mining some rich ore in the Lone Pine. Al Hageman is prospecting and living in hopes of getting rich. He has good chances ahead of him and is very much encouraged with a vein of lead ore in sight in the Ida May mine. He is finishing his assessment work on the May lode, Johnny McNorton and the Laird brothers are taking considerable heavy lead ore from the Bullwhacker mine, which they are shipping to Salt Lake. They are making good wages.

New Pass District.

CLOSING DOWN.—Reese River *Reveille*, Dec. 24: Ramdohr and Starrett Bros. have shut down the mine at New Pass for the present and discharged the miners. Dennis Scully, Jim Canwith, George Francis, Bob Crawford and John McCormick arrived here yesterday, while those living in Battle Mountain have departed for that place. It is not known when they will begin operations again.

Ploche District.

FURNACE.—Record, Dec. 21: The furnace shut down Thursday afternoon, owing to a lack of fluxing material. It will depend on the state of the weather as to when it will start again. For two weeks past it has been impossible to bring in either ore or supplies from the outside, and the furnace during that time has been run on material accumulated before. After three weeks of almost uninterrupted storm, appearances indicate further bad weather. On Thursday, the concentrators at the Reduction works after a lay-off of several weeks for alterations, started on Half Moon ore and will run until the ore now accumulated is finished.

TRAMWAY.—That portion of the Half Moon tramway running from the Raymond Shaft along the hillside west of town to the vicinity of the schoolhouse is all graded, and rails are laid on a good portion of it; cedar ties are used and the track is built the same width as the old Bullionville road, and some of the cars formerly used on that road will be utilized here. The completion of this portion of the tramway will greatly facilitate the delivery of ore and supplies at the furnace when next it runs.

Sylvania District.

SALE.—Cor. Inyo *Index*, Dec. 24: John Bushard, who was in town a few days ago from Palmetto district, reports the sale of the Kinkead mines at Sylvania district to S. F. parties for \$30,000. Fifteen thousand was paid in cash, balance on completion of sale. The sale was made by Andy Fyffe, and reduction works will be put up this coming spring. These mines are in Esmeralda county, Nevada, about 60 miles east of Big Pine. A new wagon road will be built through the southeastern part of Deep Spring valley, connecting with the Ashmore toll road to Big Pine.

Tuscarora District.

ELKO CON.—Tuscarora *Review*, Dec. 27: The crosscut at the bottom of the incline has been extended five feet; rock very hard.

BELLE ISLE.—West crosscut from the north gangway, 350-foot level, extended 14 feet. West crosscut from south drift, 250-foot level, extended nine feet; face is all in low-grade ore.

NAVAJO.—The stopes above the 150-foot level continue as at last report. The crosscut near the station has been cleaned out and a crosscut from the north drift advanced four feet. Mill now running on Navajo ore.

GRAND PRIZE.—400-foot level: Winze from south drift suok 15 feet, bottom in low-grade ore. West drift from north crosscut extended 14 feet. North crosscut, 500-foot level, extended 11 feet through a very hard formation.

NEVADA QUEEN.—The south drift from Commonwealth has been extended 22 feet, the whole face being ore, some of which is high grade. Joint crosscut from 600-foot level, North Belle Isle, is being pushed toward the vein as fast as possible.

NORTH BELLE ISLE.—Stopes above the 300, near Quee line, are without material change. The concentrator is running as usual.

NORTH COMMONWEALTH.—Third level: Joint crosscut east has been advanced nine feet; continues to show some ore in the face. Water is not so strong as at last report. East crosscut from south drift has been extended 17 feet without material change.

DEL MONTE.—No. 2 west crosscut on the first level has been advanced eight feet. The face of the crosscut is low-grade ore and looking very favorable. The work of cutting out second level station is about complete; will have the chairs in to-day. Drift will be pushed into the ore as fast as possible.

COMMONWEALTH.—300-foot level: North gangway extended 17 feet. The stopes throughout the mine look well; 425 tons concentrator ore have been sent to the concentrator; average \$15.83 per ton. Concentrates average assay for the week, \$249.79 per ton. Average assay of first class, by car sample, \$289 per ton, put in ore bins at Union mill. Some repairs needed at the mill are being made preparatory to starting on the 1st.

ARIZONA.

GOLD BULLION.—Prescott *Miner*, Dec. 30: Wm. H. Faulkner, of the Quartz Mountain Mining Co., to-day shipped a \$2000 bar of fine gold bullion, the result of 40 hours' run of their mill. Parties who came through Copper basin yesterday say that the smelter there was in full blast. Frank A. Patty, foreman for J. R. Liston of the Old Reliable mine in the Bradshaws, says the mill is running to its full capacity, while the mine is in a splendid condition, showing up large quantities of good ore. A pack train of three animals came in yesterday afternoon from the Bradshaw mountains, loaded down with bullion from the Crowned King mine. The value of the bullion is not stated, though it is esti-

mated by those who have seen it to be worth \$74,000 or more. The Fortuna mine near the lower dam has been sold to a Phoenix blacksmith named Vasquez. E. S. Bennett, the hydraulic engineer who accompanied the Bates party to Stanton, came in on last night's stage. He has made extensive investigations of the placer grounds of the Electric Placer Co., and expresses himself highly pleased. Geo. E. Brown returned from an official visit to Cherry creek yesterday, and says the Mockingbird mill is crushing 20 tons of ore per day. J. R. Liston gives employment to eight or ten men at the Old Reliable mine and the Del Pasco mill. The Rapid Transit, owned by Jacob Henkle, in the Bradshaw mountains, is well opened up, and shows a large body of fine ore. Superintendent M. R. Kiley came in to-day from the Ryland mine at Minnehaha flat, with a large shipment of fine gold bullion, the product of the Ryland mill. The value is supposed to be away up in the thousands. A clean-up will be made at the Mockingbird mill to-day or to-morrow. Parties who have recently visited this property say that the yield is even larger than was anticipated. Messrs. Palmer, Martin and Goodfellow shipped their supplies out to Martinez to-day, and the latter two will leave next week to commence work on the Highland Mary mine. W. H. Harlan is working the Wild Cat claim, on the Hassayampa, and is getting good ore, which he will run through the Howard mill in the spring. J. K. Hall was in from the Lynx Creek hydraulic works to-day. He says that there are six men employed there in washing rich gravel. They have been running now for two weeks, but have not yet made a clean-up. A clean-up was made at the Mockingbird mill last week which proves highly satisfactory. The result was even greater than anticipated by Mr. Ried or Superintendent De Kuhn. The ledge of the mine is five feet in width, and all the ore taken from it is run through the mill without sorting.

NOTES.—Prescott *Courier*, Dec. 29: Wm. A. Finn has gone to Bradshaw district to start work on his Tiger claim. A. C. Gilmore and Wm. Murphy, just from the Oro Bella section of Bradshaw, say that mills and mines are doing first rate. Robert Dougherty has returned from a long prospecting trip to the Harcuvaru mountains. Says he saw nothing to compare with this mineral belt. There's another Silver King complication. Company refuse to pay Mr. Rubert balance of purchase money, over \$7000. Mr. Baer, one of the company, is here from the East, so we hope for a settlement of questions. Mr. O. F. Place, president of the Crowned King M. & Co., does not want any saloons near the company's property, so he has enjoined Sheriff O'Neill from issuing license to a Mr. Patrick.

COLORADO.

NEW ORE CONTRACTS.—Aspen *Times*, Dec. 22: It was stated last evening on undoubted authority that the Aspen and Compromise mines had completed contracts for their January output. As near as could be learned, the contracts are with several different concerns and call for an aggregate of 150 tons per day from each property. This figure is larger than the average for the two mines before the shutdown and will require the employment of a greater number of men than were formerly engaged. The Mineral Farm continues to look well. It is reported that some ore has been found in the Romulus. The Edison improves rapidly. It is opening up at two points and both ore bodies give promise of being bonanzas. New developments have been made in the Silver Bell during the past few days that show the ore body to be even larger and richer than has heretofore been supposed.

A NEW PLACER BONANZA.—Denver *Republican*, Dec. 26: A company is to be shortly organized with \$300,000 capital to purchase 320 acres of placer ground on the Tyler estate, embracing 3 1/4 miles on Boulder creek and 2 1/4 miles on Beaver creek just above their junction. Forty acres of ground has been worked above the Tyler estate for 15 years, and it has yielded largely in gold, even at the present time paying excellent wages to the parties working it under a lease. At the junction of the creeks about 2 1/2 acres has been "pawed over," with the result that \$40,000 in royalties have been paid. Bedrock on this small space has never been reached. The new company will work thoroughly all the ground on Beaver creek to the upper line of the estate, and on Boulder creek to the 40 acres which is now being worked and has proved so rich in the past. The area to be purchased is virgin ground, and for some reason has been heretofore supposed to contain very little gold. Recent prospecting has, however, demonstrated that the dirt is equally rich with that found at either place where mining has been done. W. C. Lotthrop & Co. obtained a bond upon the property some little time ago, and commenced careful investigation as to the value. They got I. B. Lambing, of California, a placer miner of 40 years' experience, and reputed to be one of the most conservative experts in the United States. Mr. Lambing visited the property and spent several weeks in its thorough examination. He returned late last week and reported in substance as follows: That there are 300 acres of placer ground on both creeks. That the Beaver creek dirt for the whole distance of 2 1/4 miles will average 73 cents to the cubic yard, and that the 3 1/4 miles on Boulder creek will average 61 cents to the cubic yard. That there are 1000 inches of water, with a dump of 124 to 300 feet to the mile. That it will require 20 men 20 years to work the ground thoroughly. That the total product, all allowance being made for waste, cost of sluicing and other expenses not including labor, will be very little less than \$2,000,000. Lotthrop & Co., S. H. Baker, Esq., being the silent member of the firm, are acting upon this report and will organize in a short time a syndicate, which will contain at the most three other gentlemen. They will ground-sluice the property and work for awhile in this manner. Subsequently they will put in the giants and tear down a great amount of gold-bearing dirt and rock. The expectation is confident that \$40,000 will be taken out the coming season.

DAKOTA.

NIGGER HILL TIN.—Deadwood *Pioneer*, Dec. 25: Chas. Finch, superintendent of developments on the claims of the American and Cleveland tin companies, is in the city, and from him we learn that more ore has been uncovered and taken out the last three months than during all the former years of developments. Three claims, Isabel, Tolo and Columbus, heretofore considered worthless, have de-

veloped into as good, if not better mines than the Cleveland. Reduction works of some kind will be in operation before the close of the year 1890.

SYNDICATE SMELTER.—The Syndicate smelter will blow in for another run immediately after Christmas. Contracts were made yesterday for fifty tons of Ross-Hannibal ore, and for an equal amount from the Tornado, Harmony and Double Standard companies. Pyrites will be obtained from Galena.

IDAHO.

OLD ABE.—Charles Sinclair and partners are running a 200-foot tunnel on the Old Abe on Elk creek; a distance of 50 feet has been attained with most satisfactory results. The vein is six feet wide and averages well in silver and lead.

MAYFLOWER.—J. C. Rasberry and J. W. West are developing the Mayflower claim on Pine creek. Their incline is down 30 feet, in the bottom of which is a body of good concentrating ore, one and a half feet in width. The Mayflower is a most encouraging prospect.

BEAVER DISTRICT.—The wonderful discoveries on Sunset Peak are regarded as among the most important made in any portion of Cœur d'Alene, and the coming season will be one of much activity in and around Carbon Center. Notwithstanding the great elevation of the mines, work is progressing rapidly and will be continued during the winter.

SITTING BULL.—The Portland M. Co., with W. H. Pettit as superintendent, keep a force of men employed on the Sitting Bull getting out ore, and teams are constantly employed in hauling the product to the railroad for shipment. The hoisting plant and other machinery which arrived over two months ago will be put up early in the spring.

CUSTER.—The Porter Bros. and W. H. Claggett are steadily working the Custer mine, and those familiar with its development pronounce the property one of the richest in the prolific district to which it is located.

PONY GULCH.—Success appears to crown the efforts of Supt. C. Kraus of the Fay Templeton mine, who keeps 20 men employed day and night on that property. The quality of the ore extracted is most excellent and the quantity in sight equally satisfactory. The mill is running uninterruptedly.

THE ELKHORN MINE.—Boise *Statesman*, Dec. 24: Mr. E. H. Hesse, who has recently been engaged in making surveys of the famous Elkhorn mining property in the Boise Basin, gives a very encouraging account of the present condition and future prospects of the Elkhorn and adjoining properties. The old works on the original Elkhorn were abandoned many years ago on account of the accumulated water, for which the miners of that day had failed to provide means of drainage. The lode where left had proved very rich, over half a million dollars having been extracted during one short season's operations. During the past two years, Mr. Hugh Turner has been engaged in running a lower tunnel with a view to tapping the old Elkhorn lode. This tunnel is now in some 1200 feet, having cut through four parallel veins in that distance. These veins all show good bodies of paying ore, from one of which Turner realized some \$25,000 in a few weeks. At present the property is bonded to a Boston company, which is pushing operations on a healthy scale. At the end of the tunnel named, a double compartment upraise is being prosecuted with a view of tapping the bottom of the old works on the Elkhorn. The new 50-stamp mill to be built next season will be run by water-power, as will also be the electric plant to light the mine and mill. Only a limited force—some twelve men—is now employed. The only means of crushing ore at present is the five-stamp mill used by Mr. Turner. The mine is situated on Elk creek, about ten miles above Idaho City.

THE BUTTERCUP MINE.—Ketchum *Keystone*, Dec. 21: In consequence of the damages occasioned by the snowslide which occurred last week at the Buttercup mine on Willow creek, Supt. Childs has suspended further operations at the mine until spring. The closing of work during the winter will no doubt be quite a drawback to the development of the mine, but the casualty which has caused the cessation of work for the present was beyond the power of human effort to avert.

MONTANA.

RUBY DISTRICT.—Butte *Inter-Mountain*, Dec. 28: In the Lowland district operations have been suspended for the winter, though considerable prospecting and reprocessing is being done by quite a number. The Amazon is just at present the only mine in operation in the district. The ore is shipped to Butte and is like all the ore in that locality, gold in character with a sprinkling of silver. There is no excitement concerning the mines as in old times. No such excitement disturbs those now busily engaged in developing this country. The best known mine and most prominent is the Ruby. The depth of the shaft is 100 feet, but the company have confined themselves to stopping from the 50-foot level to the surface. That is about exhausted. It is stated by parties who have worked it that the company has netted fully \$100,000 from this amount of ore worked.

THE LEXINGTON.—The Lexington shaft is pushing on to the 1500-foot level and is the deepest perpendicular shaft in the whole State of Montana. More attention is paid to the sinking of this shaft than the sinking that is being carried on in all of the mines of Butte, as on the results, when that crosscut connects with the lead on the 1500, will depend the future of deep mining in this district. Many assertions have been made by many of the prominent mining men as to the continuity of ore bodies in depth. Some claim that the leads become richer as depth is attained as in the Mountain View, while others that the deeper, the more base becomes the ore and that it will run ultimately into iron or barren rock. Thus far the former assertion seems to be more correct, as is witnessed by many of our great mines, though more particularly the copper ones. This company deserves great credit for being the first to commence sinking to any great depth and after reaching the 1000-foot mark to keep right along without interruption. Edmond Williams, at the mouth of Park canyon, has his tunnel in 175 feet. It will be continued in 250 feet farther, when it is expected it will tap the lead. The Iron mine in Park canyon has lots of ore on the dump to answer all demands made upon it. It is used entirely for fluxing. It is reported that the Butte Reduction Works will shortly start up their blast furnaces that have so long lain idle. The concen-

trator and calciners are running at their full capacity. The Mountain View is having some difficulty in getting rid of its ore. The mine is now compelled to lay some of the boys off every once in a while on account of the chutes being full. The East Gray Rock continues shut down owing to part of the machinery of that mine being used at the Silver Bow. Remarks have been current that the Anaconda Co. intends to shortly open the Anaconda mine. The Odin has again suspended operations. The pumps are hoisted to the surface. The Plutonia has also thrown up the sponge. It was operated by Messrs. Haupt & Rafferty. Dr. Larkin is working eight miners in Horse canyon on his claim. The lead has been encountered and looks very promising. Robt. Tait, the millwright who constructed the Champion mill, states that the mill will not be able to start till some time in February. There is shipped daily from the five Chamber syndicate of mines, the Mountain Consolidated, Green Mountain, Wake Up Jim, Modoc and Matte, about 1500 tons of ore, which is hauled to Anaconda by 70 or 75 of the Montana Union cars.

THE KEYSTONE.—New Northwest, Dec. 26: The report of an important strike in the Keystone has been verified. The dip of the lead brought it into the shaft at 112 feet, and it has straightened to such an extent that the working will be on vein matter for 20 feet at least. The ore body is about four and a half feet wide and sample assays go from 40 ounces up.

THE CHAMPION.—Regular, though not large, shipments of ore continue to be made, enough to pay the running expenses of the mine pending the completion of the mill. With the exception of a part of the machinery, all the material for the mill is now on the ground.

THE FRANKLIN.—The men who recently took the contract to extend the Franklin tunnel 500 feet had made 75 feet of the distance last Sunday. The development thus far on the contract has been a stringer of very fine ore and a change for the better in the character of the formation.

OREGON.

POWDER RIVER.—Union *Scout*, Dec. 21: Powder River is again attracting the attention of our miners and J. G. Lewis will leave for the East to perfect the organization of the Powder River Flume and Mining Co. on the three miles of the river owned and controlled by the J. G. Lewis Co. Owing to the very and unusual low stage of Powder river last summer only the rocker could be used, yet every one working realized good wages and it is now known that M. Ferri, doing assessment work for the J. G. Lewis Co., realized over \$1000 in three months.

SPARTA.—Cook & Younger, the Sparta Rustlers, have uncovered some very rich free gold and sulphure ore on their Bismarck and Opulent mines belonging to the consolidated New Golden Era group adjoining the Gold Ridge group on the west. The Ollie Woodman, belonging to this group, shows three feet of high-grade ore and the incline shaft will be sunk 50 feet this winter and levels run at this depth. The ore from the Ollie Woodman shows \$18 in gold by free amalgamation and \$21 gold in sulphurets to the ton. They have suspended work on their rich free gold property on East Eagle creek and will actively develop the consolidated New Golden Era group, which is now conceded to be one of the most promising group of mines in the Sparta district.

UTAH.

A STRIKE IN BLUE LEDGE.—Park *Record*, Dec. 29: The Ontario bullion product for the week was 29 bars, containing 17,047.55 fine ounces of silver. The bad condition of the roads interfered with ore hauling the past week. The Crescent has not yet resumed shipments of first-class ore. Air connections between No. 1 and 2 levels have been made and the rich vein is being explored to better advantage. The Woodside's ore shipments will be larger than ever soon. During the week the Mackintosh sampler received and forwarded 394,450 pounds of Ontario ore; 174,640 of May Flower No. 7 leasers; 67,350 of Daly, and 24,180 of Woodside ore; 66,700 pounds. A discovery of a deposit of lithographic stone is reported to have been made recently in the hills below town. The Nevada-Northland leasers started this morning to ship high grade ore to the Mackintosh sampler and the first lot will be fifty tons. Work continues at the Creole No. 2, notwithstanding that a notice was served this week on the leasers, by a representative of the Townsite company, to the effect that he claimed the ore and for the sampler not to ship it. A good strike has been made in the Red Cross tunnel which is being run to develop the Silver Kay group, consisting of four claims and situated in the southern part of Blue Ledge district, near the Glencoe. The tunnel is in 28 feet and a ledge five feet in width was recently encountered which carries gray and yellow carbonates that assay well in silver and lead. The group is owned by J. S. M. Jackson, Geo. Irwin, Wm. Shavelier and Ole Yorgenson, and the tunnel will be driven along the new-found ledge.

NEW MEXICO.

MINE SALE.—Lordsburg *Liberal*, Dec. 20: The payment was made to Salcido & Co. for the mine San Francisco of which mention has been made in the *Liberal* recently, and the amount, it is said by some, was only \$2000 or \$4000, and others say that \$20,000 was received from the Arizona Copper Co. on the 16th. The company is fortunate in obtaining the property as it has been a regular pay-producer from the grass roots. Ground was broken on it in December, 1887, and it yielded over \$50,000 to the owners who never used any modern appliances in the way of machinery in extracting the ore. The waste dump holds over 2000 tons of ore that will run over 9 1/2 per cent copper. It is safe to say that Salcido & Co. did not receive any more for the mine than the dump is worth at the present price of copper. Of course, as to the amount reported received is only common report, but the writer knows that if the Arizona Copper Co. had not closed the sale as soon as it did, a good round figure within range of its value would have been tendered. J. H. Hovey has bought an interest in the Black Dyke mine, and has a force of men working night and day. It is also reported that he is going to put a 10-stamp mill on it.

MECHANICAL PROGRESS.

Steel in Locomotive Boilers.

Steel boilers for locomotives are not generally used in France, and when recently the Paris, Lyons & Mediterranean road decided to use higher pressures for compounding, one of the first matters to consider was the material and construction of a boiler to withstand such pressures. It was decided to use steel because of its greater strength, but there were some doubts of its reliability. In the light of our experience with steel boilers, these fears seem out of place; yet the steps taken to secure good steel show how carefully such matters are considered in France, and some American boiler-makers could profit by the methods there used.

The specifications for the steel required a minimum strength of 59,735 lbs. per square inch, and a minimum elongation of 26 per cent in pieces 7.87 inches in length. It is noticeable that no maximum strength was specified, as is customary in the United States.

In working the steel, great precautions were taken to prevent injury to the metal. Punches were not allowed; all holes were drilled. All flanges were turned with hydraulic pressure, and work was stopped on the steel sheets when they were lowered in temperature to a dark red color. After flanging and after being fitted and drilled ready for use, and even when rolled into form, the sheets were placed in a large annealing furnace, about 1200 cubic feet in capacity, constructed especially for the purpose, in which they were annealed, and after that the use on them of a hammer for any purpose is carefully avoided. The holes were first drilled about 0.08 inches in diameter, less than the diameter of the rivets, and after being put in place they were reamed to size. In annealing the sheets they were raised to a cherry red, and were kept at that temperature by a slow fire from 15 to 18 hours. At this time the cover of the furnace was slightly raised, the fire pulled out, and the temperature of the furnace and the sheets allowed to become reduced during the next 48 hours. The sheets were then removed from the furnace, and 12 hours after were put into position. Iron rivets were used, and driven preferably by hydraulic riveters.

The case of careful manipulation of steel sheets, with other instances of the kind which the traveling engineers saw this summer, go to show that the French, German and English engineer has not that high confidence in sheets of that material which is possessed by the engineer in the United States. If it were not for the large number of steel boilers in use here, which run practically without cracking or rupture of any sort, one might be somewhat concerned at the contrast between the scrupulous care taken by the foreign engineer and the more free and easy methods of boiler construction here. But the rarity of accidents to the vast number of steel locomotive boilers running in this country, often carelessly handled, is good evidence of the general reliability of our methods. It is true that we do punch steel boilers, but they seem to be none the worse for it. It is also true that the majority of all of the sheets in our boilers are unannealed, yet only a few of the vast number ever fail by cracking. It may be, however, that we have a better class of steel sheets to deal with, and that the large demand for steel of a low tensile strength and a maximum elongation has fostered the growth of and improvement of processes whereby we are able to obtain steel for the construction of boilers which has a uniformity in general characteristics that is almost unknown among boiler-makers abroad.

Nevertheless, in spite of the good quality of steel which we are fortunate enough to possess, and the good fortune which seems to attend the construction of steel boilers—and their use as well—would it not be well to pay a little more attention to the matter of annealing steel sheets after they have been worked upon, particularly after they are flanged? Attempts are now being made to do this, and nearly all the modern locomotive specifications call for "all sheets to be annealed after flanging," but this is almost never done in the full sense of the term "annealed," or anything like it. It is no easy matter to anneal a steel sheet, and the mere heating over a wood fire for a short time, as the practice is in some localities here, not only does not properly anneal a sheet, but sometimes it is hardened by the sudden cooling allowed. There are many steel boilers now in use which are constructed of plates that have been flanged, but which are too large to enter any annealing furnace used for locomotive boiler work in this country. In some shops, however, steps are being taken to meet the demands of the regular specifications for locomotive boilers, notably at the Rhode Island Locomotive Works, where one of the largest annealing furnaces in the United States has been recently constructed, and is now in successful operation.—*Railroad Gazette*.

SOME PECULIARITIES OF IRON.—Scientists are constantly developing new and interesting peculiarities of iron, many of which are being turned to useful account by practical mechanics. One of the latest developments in this direction is found in some French experiments, which show that if a bar of hard iron be allowed to cool from a white heat to a dull redness there is a spontaneous disengagement of heat, and its magnetic properties suddenly

change. In order to ascertain whether this result might be due to the heat set free by the modification of the iron, or if it required the presence of iron, iron was operated with containing from 0.16 to 1.25 per cent of carbon, by which means the first phenomenon above mentioned was found to be due to the molecular transformation of the iron, and the second corresponded to a change in the relation of the iron with its carbon. It takes place at 749° C., when the thermometer suddenly stops and rises some 6°, afterward resuming its regular fall, as the metal cools. This was observed with steel containing 0.57 per cent of carbon, while with only 0.16 per cent of carbon a much slighter effect of the kind was noticed at about 749°; with 1.25 per cent of carbon, the two effects appear to confound themselves. When the proportion of carbon is increased, the temperature of the transformation of the iron seems to be lowered, and that of recalcence raised, so that both come to coincide in the hard steel.—*Chicago Journal of Com.*

Shapers and Shaping Machinery.

The position of the engineer and machinist of to-day, as compared with that of his predecessor of only a few decades back, may fairly be considered as an enviable one. At that period machines which could make machines, or parts thereof, were almost or quite non est. Nasmyth's steam hammer did not exist, and the production of large masses of forged iron was an extremely laborious and often risky affair. And for preparing parts for the fitting shop, almost the only mechanical apparatus driven by power was the lathe, with the slide-rest scarcely perfected.

The planing machine, even in its most rudimentary state, as yet was not, and the only method of producing a perfectly plane surface on metal was by chipping with the chisel, and afterward scraping or grinding, a toilsome and unsatisfactory process. For pieces of irregular or peculiar shape there was no forming apparatus save the common file impelled by the arms of the worker, and the boring bar was equally a thing of the future.

The invention of the planing machine was a great step. Henceforth the engineer or machinist had a ready and certain method of securing perfectly plane surfaces by the aid of power.

The planer naturally and of course gave birth to the shaper, which is, at least, equally useful with its parent, and of very wide applicability.

The shaper is now found in every machine-shop, is made in many forms by different manufacturers, and of various sizes, from small examples to be operated by hand to the larger species of power-driven machines.

The difference between a planer and a shaper consists essentially in the length operated upon by the cutting-tool in one stroke.

"The stroke of a shaper is usually limited to a few inches, since the work is fixed, and the tool travels, and the rigidity of the tool is dependent upon the length of the arm that carries it. But in a planing machine the tool is fixed on the cross slide, while the table travels, and the rigidity of the latter, and that of its bed, will allow of a stroke of as much as 40 feet being taken. Hence planing machines are proper for long faces, but shapers are quicker in action for small work."

So was the distinction between the two classes of tools tersely put some time since by a writer in the *English Mechanic*.

In many of the shapers the tool-boxes have motion in one direction only, but in the better class of machines both vertical and horizontal movement is secured.

Indeed, in some shapers of elaborate construction intended for use in large shops, the tool-plate is rendered capable of circular motion, also for the shaping of convex or concave surfaces, the varying degrees of curvature required being obtained by very ingenious contrivances.

These machines are susceptible of being actuated at different rates of speed, according to the work on them. For brass, for example, the speed at which they are driven is faster than for iron.—*London Builders' Reporter*.

ANNEALING AND HARDENING.—Copper, brass, German silver and similar metals are hardened by hammering, rolling or wire drawing, and are softened by being heated red hot and plunged in cold water. Copper, by being alloyed with tin, may be made so hard that cutting instruments may be made from it. This is the old process of hardening copper, which is so often claimed to be one of the lost arts, and which would be very useful if we did not have in steel a material which is far less costly and far better fitted for the making of edge tools.

THE MOST POWERFUL ROLLING MILL engines in the world, according to the *English Mechanic*, are the reversing engines just made by Galloways, of Manchester, for Palmer's Ship-Building Co. The engines drive a 44-inch train of rolls. The cylinders are 56 inches diameter and 6-foot stroke, and use steam at a pressure of 100 pounds. The finishing shaft has journals 21 inches diameter, and is of a total length of 23 feet 6 inches. The total weight of the engines is nearly 300 tons.

ADDED TERRITORY.—By the re-survey of the boundary-line between Nevada and California, the latter gains a strip over 200 miles long and three-quarters of a mile wide.

SCIENTIFIC PROGRESS.

Fossil Remains in Oregon.

The John Day region in Oregon was the scene in the Princeton University scientific expedition last summer, and as a result a grand collection of fossils was obtained.

From the Blue mountains westward to the Cascades the country is a great volcanic plateau, made up of lava sheets piled one upon another and indicating ancient volcanic outbursts upon a stupendous scale, in comparison with which such vents as *Ætna* and *Vesuvius* are the merest pygmies. Through this mass of lava the streams, aided by the atmosphere, have cut deep valleys, some of them broad and open, others deep, gloomy canyons.

This country is very dry, but the soil is excellent, and where irrigated it produces well, the vegetables and fruit being of particularly fine quality. Great acres that are now arid sagebrush deserts will one day be turned into fertile farms by means of artesian wells, and the mild climate will insure success. At present the great industry is wool-raising. The enormous bands of sheep utterly destroy the grass of the country over which they range, till it looks as if a plague of locusts had visited it.

The scientific attraction in the John Day region is the vast assemblage of fossil animals which is entombed in the rocks there. This entire district was in a former geological age the bed of a great fresh-water lake, into which the streams brought masses of sand and mud and volcanoes showered cinders and ashes. Animals which were swept into the lake in the times of flood became covered with silt, and as the latter was in the course of ages consolidated into rock, the bones of the victims were gradually petrified and thus indefinitely preserved. Now the rock is slowly disintegrated by the action of the rain, snow and frost, and the bones exposed to view or even washed entirely out. For the most part, however, the specimens must be cut out with pick, hammer and chisel, a very laborious process, as the rock is often extremely hard and the blazing summer sun makes the face of a white cliff anything but an ideally comfortable place.

Could we produce a view of that ancient Oregon when the John Day lake existed, we should find ourselves in a very strange animal world; little three-toed horses hardly larger than donkeys, rhinoceroses, camels, peccaries—a great assemblage of large and fierce cat-like, dog-like and hyena-like animals—not to mention hosts of little rabbit and squirrel like creatures. The animals of this time were all rather small, the largest being the entelodon, a beast not unlike the hippopotamus in size and general appearance. As the list shows, this assemblage has a very Oriental character, and this wonderful museum of a buried world has been sealed up by subsequent lava floods, and is now accessible only on the aides of deep canyons cut through the overlying masses of volcanic detritus.—*Scientific American*.

Book-Making in Japan.

We recently described in these columns the peculiar manner in which a Japanese artist works to produce paintings and drawings. We now give the equally curious manner in which those peculiar people write, or rather paint, their books. We copy from the *American Bookmaker*: Having resolved to "paint" a book—for, as all the world knows, the Japanese use a brush, and not a pen—the author betakes him to his workroom. It is a little room, a very little room. "Six mats" is its Japanese measurement, and a mat is about six feet by four. It is full of soft, dull light which pulses from a square white paper lantern; the low, bright wooden ceiling gives back a pale brown gleam here and there. There is a silvery glint in the frail paneled walls, and in a warm gray shadowed recess a gold Buddha crosses his feet and stretches forth his palms, smiling gently upon the lotus which he holds. In another recess stand the ornate vessels of iron and clay and bamboo for the tea ceremony.

The author sits on the floor in a flowing garment of brown silk lined with blue, his legs disposed comfortably under him. In front of him stands a lacquered table about a foot, and upon it his writing materials, which are as idyllic as his surroundings—his paper is delicately tinted yellow, with blue lines running up and down. His inkstand is a carved ebony slab, with one end hollowed out for water to rub his ome of india ink in, and holds the four or five daintily decorated bamboo brushes which are his pens. Naturally he does not write his novel; he paints it. Beginning at the end of the whole, at the left of every page and at the top of every line, straight down between the two blue parallels his small brown hand goes, with quick, delicate, dark touches. Although this novelist's "copy" might seem to a stranger to be daintiness itself, yet he always has it duplicated "by an artist" before sending it to the publishers, the success of the book depending so largely upon its artistic forth-bringing. The "artist" to whom the "copy" is now intrusted proceeds to repaint the long series of word-pictures with a professional dexterity which is something astonishing.

The curious letter characters which have been, and not inaptly, compared to "cross boxes playing cricket," are thrown upon the paper with bewildering rapidity. To such an "artist," the straight up and down, rasping,

scratching, spattering movement of the Occidental pen must be something fearful.

The next step in the making of this book is to send the artistic reproduction of the author's "copy" to the wood engraver—a man of marvelous skill—whose duty it is to prepare the relief blocks, a task which he performs with extraordinary faithfulness to the original.

The printing is extremely simple. The ink is distributed with a brush, the paper laid upon the block, a feather, fashioned from a palm leaf, passed over it and the thing is done.

The binding is of the simplest kind. The Japanese public, unlike the book-lovers of the West, care little for that feature. A plain paper cover suffices, with the title in the left upper corner of the verso.

But the arrangements with the publishers are simply delicious. Said a Japanese author in answer to the inquiry of a European friend: "I pay the publisher myself; I do not mind losing by my own work, but I will not permit another person to make money by it." Think of it! Think of it, ye Murrys, Macmillans, Harpers and Appletons! Here's dignity of authorship for you. What a fruitless task a Western barbarian would have were he to attempt to explain to such childlike simplicity as this that the true dignity of authorship demands competition among publishers—immediate returns and freedom from the risk of fickle public taste.

A REPORTED ARCTIC DISCOVERY has been communicated by Captain George B. Leavitt, of the whaling ship *Spy*, of the Pacific Steam Whaling Company. He recently arrived from Alaska, where he has been for five years. He brings the first news, of what may possibly be the discovery of hitherto unknown land, many miles directly north of Alaska. During a cruise of one of the vessels of the whaling fleet, which ventured many miles farther north than any others, a few years ago, the officers discovered land that could not be found on any of the charts or accounted for in any way. A gale drove the vessel far north along the shore of the land, but the season was so late that the men did not stop to explore. The men held it was unknown land worthy of exploration at the proper season. No vessels since then have been so far north. Leavitt thinks this may settle the question of an open polar sea and ice drifts south of Point Barrow. He says the ice must find an outlet some other place.

WHERE AMERICAN ART IS APPRECIATED.—Some of the French artists at the Exposition range the foreign paintings as follows, with regard to their respective merits: The United States, Austria-Hungary, Holland, Belgium, England, Spain, Denmark, Italy. Politely may account for the poor representation of Italy, and perhaps the close imitation of French work performed with astonishing dexterity by our young artists in Paris may have something to do with the place of the United States at the top of the list. Spain had a fine show and disputed the first place with the United States, but Spanish art is mainly the work of a few men, whereas from America many hail. But throughout all the foreign section, with the exception of Great Britain and Holland, all that was good showed the influence of France. Holland has a distinctive style of its own and not a bad one.

AN EXPERIMENT SHOWING HOW PRIMARY COLORS PRODUCE WHITE.—Cut a circle of pasteboard nine inches across. Divide it into four parts; then divide each of these into seven. With bright, clear water-colors paint these narrow pie-shaped strips with red, orange, yellow, green, blue, violet, indigo, in this order; then begin, and do this in each quarter. Put a round, smooth nail or pin through the center of the disk where the points of the colors meet; drive this into a heavy board edge and whirl it around as fast as you can. The colors disappear, and you see a round but rather dirty white circle. If the colors were pure it would be pure white; if they were really prismatic you would have a little shining white moon of light.—*National Educator*.

AN IMPORTANT PHOTOGRAPHIC DISCOVERY is reported to have recently been made by Mrs. N. Gray Bartlett of Chicago, the wife of a prominent analytic chemist, by which photographs can be developed without the old-time process of washing in a dark room for hours and staining the fingers. By her process there is nothing to be done but to expose for a few minutes the negative, with the sheet of paper clapped on it for a few minutes, to the light. The pictures produced by Mrs. Bartlett's process are said to have the appearance of fine etchings. The development solution is smeared with ruby dye, which prevents white light from reaching the plate after being immersed in the liquid.

AN APPARATUS FOR PRODUCING ELECTRICITY. A very simple apparatus for obtaining an electric spark is made by a German physicist. Round the center of a common lamp chimney is pasted a strip of tin foil, and another strip pasted from one end of the chimney to within a quarter of an inch of this ring. Then a piece of silk is wrapped around a brush, and the interior of the chimney is rubbed briskly. In the dark, a bright electric spark may be seen to pass from one piece of tin foil to the other each time the brush is withdrawn from the chimney. Many other experiments can be tried with this apparatus.

ELECTRICITY.

The Future of Electricity.

Thomas A. Edison said, in an interview with a reporter of the *Pittsburg Dispatch*: "You ask me about the future of electricity. It is the coming motive-power. It will be used on all the railroads some day, but the point is to get an economical engine. My theory is to have immense dynamos located all along the line of the road, and have the electricity conveyed from these stationary engines to the locomotives by wires through the rails. For example, I would put two big engines between New York and Philadelphia, and enough power could be furnished to whisk the limited at the rate of 100 miles per hour."

"But this is the point I have been working on for years—to convert heat directly into electricity without the intervention of boilers, steam and all that. What an enormous amount of expense could be saved if this could be done! Think of putting something into the heat of that natural gas fire and making electricity out of it. It can be done. I feel it in my bones, and just now I have a suspicion that I am on the right track; but it is a pesky problem—one that can be worked out only in time."

"I have been experimenting with an electric road in New Jersey. I had rails laid as they put them down on railroads, but the machine would run off the track in going around the curves. I then raised the curve to an angle of 40 degrees, and the motor went around all right. It looked as if the engine would topple over, but it didn't. You know in a centrifugal machine you can make a car go clear around a circle in the air without leaving the track."

WHAT BRANCHES EMPLOY ELECTRIC WELDING.—At present, electric welding machines in different parts of the country are being used in the following capacities: Axle welding, carriage gears, fifth wheels, twisted wire cables, welding safe ends of boilers, wagon tires, hoops for barrels; it is also used for joining wires of copper, iron, steel and German silver together in like metals and different combinations; bars of metal may be joined at angles, as T or Y joints; welding eye rings to the end of bars; making rings of precious metals, uniting steel with iron in the manufacture of agricultural implements, tools, etc.; lengthening or shortening rods, bars, screws, or bolts; welding of cast-iron pieces in the general construction of machinery, such as frames, fittings, etc. Electric machines are also used in welding boiler plates and other sheet metal and thereby replaces the ordinary method of riveting. These machines are suitable for clamping devices, for electric soldering, brazing, forging or bending of metals. The electricians in the establishment of the Thomson Electric Welding Company of Boston are now experimenting on radiator and general brazing, on riveting machines which, it is claimed, will cause a complete revolution in the old methods of riveting, as by electricity the riveting can be done so as to avoid all leaking. One of the latest and most satisfactory developments has been that of welding chain. The company claims that a great merit to the electrically welded chain links is that when subjected to a fracturing load the link will break away from the weld, whereas when welded by ordinary processes it almost invariably breaks at the weld.

PROGRESS OF ELECTRIC WELDING.—The Thomson Electric Welding Company, at their Lynn works, have within a few weeks been able to weld wire cable 1 5-16 inches in diameter for a cable to be used on a cable railroad, showing greater efficiency than was thought possible in doing this very difficult work. Although the strength of joints obtained by splicing was about 30 per cent that of the original cable, yet it was found from tests made at the Watertown arsenal of electric welds made of this cable that 87 per cent of the efficiency of the rope itself had been obtained in these welds. The same company writes to the *Pittsburg Reduction Company* in regard to welding aluminum by electricity as follows: "We have made tests of the aluminum which you are producing, and find that it welds without the least difficulty. We have a special machine built for this work. The welds are very rapidly made and submit to the various tests and with most satisfactory results. We can weld the aluminum of any section or size. It simply depends upon the class of machine built for the purpose and the horse-power required."

AN ELECTRIC REGISTER.—New electric devices are being brought out almost every day, a feature characteristic of the electrical industry and its development. The latest invention, and one that has not yet been made public, is the "electrical register." It is intended to be used for a variety of purposes. A series of buttons along the inside of a horse car within easy reach for the conductor, connect with the register at the end of the car in somewhat the same manner as the present existing arrangement. By pressing one of these buttons the fare is registered and the announcing bell rings simultaneously. In the system used at present the conductor pulls the leather strap which rings the bell and the fare is registered by the return action of the belt. It is said that in the present method the gong can be rung without registering the fare by skillful manipulation. Again, in unloading a ship, switches can be so

arranged that each parcel of similar size, as in tea cargoes, registers as it closes the electrical connection. The same device can be applied in a pork-packing establishment, or in any place where it is necessary to record repeated action.

TEMPERING THE ELECTRIC LIGHT.—The electric light has now been long enough in use in our houses, theaters and public places to lose the right to claim any special privileges or immunities as a novelty or a plaything. Will some one kindly notice that there is nearly always too much of it? No sooner was gas laid on than people who had contentedly read their book by the light of a single flickering candle must have gas-jets equal to 15 or 20 candles. Now, if there is not a regular sunburst of 100-candle power, the same people feel that they are in the dark. It is too, too much. At one or two theaters, for instance, you can't enjoy the comfort you would otherwise derive from the diminished heat and improved ventilation, because of the glaring auditorium lights that strike you blind.—*New York Tribune*.

ELECTRICAL UTILIZATION OF WASTE HEAT.—A very interesting paper was recently read before the South Stafford Institute of Iron Steel Works Managers at Dudley, England, on "The Application of Electricity to Works and Mills." The reader stated that there was everything to recommend an electrical transmission plant. Waste heat from blast furnaces could be used miles away; steam boilers could be placed near the colliery to save hauling the coal; the power of a river or stream could be used and hundreds of horse-power conveyed along small copper wires, while the places could be lighted by electricity at a very low cost.

ELECTRICITY VS. OIL.—A report received at Washington from Guatemala states that since the introduction of electric lighting into the towns of that country, there has been a large diminution in the importation of mineral oils. In the capital of the Republic, with a population of 70,000, and in Quetzaltenango, with 30,000, the consumption of oil has fallen off one-half. At San Jose, Retalhulen and Antigua, the substitution of electric lights for oil illumination has been in a still larger proportion.

PAINT FOR INCANDESCENT LAMPS.—Electric incandescent lamps are sometimes used in the dark-rooms of photographers; and in order to render the light non-actinic, it is recommended that the bulbs should be painted over with a mixture of the red "fuchsin" in negative varnish. It may be remarked that the lower the current the redder the light from an incandescent lamp is, and hence the less need there is for the paint.

ELECTRICITY FOR EXPANDING HOOPS AND WHEEL TIRES.—An American electrician has devised a method of expanding hoops and wheel tires by heating them with the electric current. It is claimed for the new process that the heat is more uniformly distributed than with gas furnaces or piles of embers. The current is brought by wires connected to opposite points on the tire, and divides equally through each half of the ring.

ELECTRIC LIGHTING IN ENGLAND.—Lord Balfour of Burleigh, the Parliamentary Secretary of the British Board of Trade, states that the board has been overwhelmed this year with applications under the Electric Lighting Acts of 1882 to 1888 for provisional orders to sanction the production and supply of electric lighting in all parts of the United Kingdom. Already the number of applications has reached 430.

ENGRAVING BY ELECTRICITY.—Engraving on glass and crystal is now successfully accomplished. The glass is covered with a concentrated solution of nitrate of potash and put in connection with one of the poles of the battery, and the design is traced out with a fine platinum point connected with the other pole. By this process it is claimed that marvelously delicate work can be done.

CHEMICAL AND FRICTIONAL ELECTRICITY.—Some one asks what is the difference between electricity generated by chemical process and that generated by friction, magnets and otherwise? The answer given is that the difference consists in tension or potential; frictional electricity has very high tension compared with that generated by a battery.

THE STORAGE BATTERY heretofore to the windmill is sure to become of great service in driving the machinery of future generations. Before very long more attention will have to be given to the yoking of the winds, waves and tides to the driving shafts of our industrial works to supplement the storage-reservoirs of the coal mines.

MELTING IRON BY ELECTRICITY.—In a foundry near Moscow, so intense a heat is obtained by means of electricity that metals can be fused almost instantaneously. The glare, however, of the electric light produces such painful effects that the workmen refuse to work for more than two hours a day.

THE MAXIMUM POWER generated by an electric motor is usually considered 75-horse power; but experiments indicate that 100-horse power will be reached.

SOMEbody says that an electric wire is an ugly thing when anything serious crosses it.

GOOD HEALTH.

A Novel Cough Remedy.

The following is from a doctor connected with an institution with many children: "There is nothing more irritable to a cough than a cough. For some time I had been so fully assured of this that I determined, for one minute at least, to lessen the number of coughs heard in a certain ward in a hospital of the institution. By the promise of rewards and punishments, I succeeded in inducing them to simply hold their breath when tempted to cough, and in a little while I was myself surprised to see how some of the children entirely recovered from their disease. Constant coughing is precisely like scratching a wound on the outside of the body. So long as it is done the wound will not heal. Let a person when tempted to cough draw a long breath and hold it until it warms and soothes every air cell, and some benefit will soon be received from this process. The nitrogen which is thus refuted acts as an anodyne to the mucous membrane, allaying the desire to cough and giving the throat and lungs a chance to heal. At the same time a suitable medicine will aid Nature in her effort to recuperate."

ARE ASPHALT FUMES INJURIOUS TO HEALTH? In the Circuit Court at Buffalo, N. Y., a few weeks since, the trial was begun of an action brought by Michael Kavanaugh against the Barber Asphalt Company. The case is the result of the agitation on account of the odor arising from the asphalt works. Residents of the West Side have complained of it for a long time. Mr. Kavanaugh lives with his family at 347 Fourth street, and claims that the smell is injuring their health. He alleges, too, that it caused the death of his daughter. Dr. F. W. Bartlett was a witness, and his evidence was directed to show how the odor from the works might have led to consumption, the disease of which Mr. Kavanaugh's daughter died. Residents of the vicinity were called to the stand to testify concerning their experiences with the same odor. Richard H. Ferguson of 105 Maryland street swore that it had a suffocating effect on him. Mr. Kavanaugh demands \$10,000 damages.

THE EUROPEAN EPIDEMIC.—Telegraphic reports say that a frequent sequel to cases of influenza at Vienna is an attack of inflammation of the lungs. A number of persons in the hospital lately suffering from influenza have been stricken with inflammation of the lungs and several of them have died. The influenza has made its appearance in a Jesuit school at Kalesburg, the pupils of which are children of conservative aristocrats. Sixty-eight scholars have been attacked. At Brussels, according to dispatches of Dec. 24th, the epidemic is rapidly spreading. Thirty per cent of the school children were then suffering and the schools were all closed. The disease has spread to all the Government offices and many officials are prostrated. In Paris at the above date, influenza reigned supreme. There were said to be over 300,000 persons in that city alone suffering from the epidemic.

A POSSIBLE CAUSE OF SLEEPLESSNESS.—A physician, writing to the *Medical and Surgical Reporter*, says: "From some experience in my own family I am led to suspect that quite often sleeplessness may be due to a closely fitting night-dress. I observed in the case of my own child, that whenever the night-dress was buttoned tightly about the throat, she was sure to have an attack of night terrors; and that she never had them when the throat was left free and open. In certain positions of the head, the neatly fitting band would occasion constriction of the throat, whence arose mechanical congestion of the brain, which gave rise to the 'terrors.' A night dress closely fitting around the throat is a vicious thing, and gives rise to cerebral congestion, which may suddenly explode in a convulsion, but much oftener, I apprehend, take the form of night terrors."

EXCESSIVE HUMIDITY AND HEALTH.—It is consoling to Californians just at this time to learn from good medical authority that excessive humidity is not injurious to health. The human race, like the wheat plant, can stand almost any quantity of water. It is had for that class of maladies which physicians group under the head of rheumatism, but it is not necessarily injurious to delicate throats or lungs, and it is positively beneficial to persons who are liable to disturbances of the stomach. We believe that the death rate in this State has not apparently been increased by the excessive rains of the last few weeks.

DISEASE GERMS, according to *Medical Classics*, are very tenacious of vitality, and their destruction is not always easy of accomplishment. The researches of recent years show that many of the substances thus far relied upon as disinfectants have no power to destroy disease-causing bacteria.

A "HOOP SNAKE."—A scientist says that there is such a thing as a hoop-snake, but that it doesn't roll like a hoop. It simply makes a succession of loops, like the inch-worm, but so rapidly that it seems to roll around like a hoop.

USEFUL INFORMATION.

To Distinguish Amber.

Amber may be distinguished from its imitations by the following characteristics: Copal is yellow and always of a uniform color, while amber is generally shaded and striped or cloudy, and when rubbed with the palm of the hand, it evolves an aromatic odor, which is not the case with copal or artificial amber. Amber when coated with tallow, and held over the fire a few minutes, may be bent, while its substitutes remain rigid. It is crushed with difficulty, cannot be abraded or scratched with finger-nail; it can be cut, filed, sawed and polished, but it cannot be welded, like copal or artificial amber.

To Unite Broken Pieces of Amber.

Coat with linseed oil the surfaces that are to be united; hold the oiled parts carefully over a charcoal fire, a few hot cinders, or a gaslight, being careful to cover up all the rest of the object loosely with paper. When the oiled parts have begun to feel the heat so as to be sticky, press and clamp them together and keep them so until nearly cold. Only that part where the edges are to be united must be warmed, and even that with care lest the form or polish of the other parts should be disturbed; the part where the joint occurs generally requires to be repolished.

TO MAKE A WHETSTONE.—It is easy to make a stone for sharpening tools and to make it sufficiently hard, and give it the "bite" desired. Take gelatine of a very good quality, which melt in an equal quantity of water. The operation should be performed in darkness, as daylight is injurious to gelatine. When melted, add 1 1/2 per cent of bi-carbonate of potash previously dissolved. Then take about nine times, by weight, the quantity of gelatine employed of very fine emery and pulverized flintstone, which mix intimately with the dissolved gelatine. Mold the obtained paste according to the desired form, and press it in as hard as possible to consolidate the mass well. After it has been dried in the sun, you will have a first-class stone for sharpening.

OLD SILVER.—To imitate old artistic productions made of solid silver, the groundwork and hollow portions not subject to friction are covered with a blackish-red earthy coat, the parts in relief remain with a bright lead luster. Mix a paste of finely-powdered plumbago with essence of turpentine, to which a small portion of red ochre may be added to imitate the copper tinge of certain old silverware; smear this all over the articles. After drying, gently rub with a soft brush, and the reliefs are set off by cleaning with a rag dipped in spirits of wine. To give the old silver tinge to small articles, such as buttons and rings, throw them into the above paste, rub in a bag with a large quantity of dry hoxwood sawdust until the desired shade is obtained.

SLOW-DRYING GLUE is stronger than quick-drying, and for general use no method gives such good results as the following: Break the glue small and cover it with water in an iron kettle and let it soak twelve hours; after soaking, boil till done, then pour it into an air-tight box, and when cold, cover it tight. As it is required, cut out a portion and melt in the usual way, exposing no more of the made glue to the atmosphere than is necessary, as the atmosphere is injurious to made glue. Of course it should never be subjected to direct heat. It is better to use glue quite thin, working it into the wood, rather than too thick. Except in veneering, glue both surfaces, and never have the wood heated.

IN STAVE DRESSING, twelve co-laborers with a machine can dress 12,000 staves in the same time that the same number of workers by hand could dress 2500 staves. Nearly all the staves in this country are made in Indiana, Michigan, Northwestern Ohio and Canada. Indiana turns out about 75,000,000, Michigan 600,000,000, Canada 200,000,000, and Northwestern Ohio makes a big third of all the staves used in the United States. In Northwestern Ohio there are more staves made to-day than ever before. The business has been doubled within the last ten years.

HOW TO CLEAN PEARLS AND CORAL.—Set pearls which have become discolored by wear may often be improved by placing in a covered vessel with a mixture of whiting, ammonia and water, and permitting them to remain a few hours. Coral may be cleaned by soaking in soda and water for some hours. A lather of soap is then made and brushed upon the coral with the softest of hair brushes. A frequent changing of water is desirable.

CEMENT FOR AQUARIUM.—Each one pound of litharge, fine white sand, and plaster of Paris, as well as six ounces of finely pulverized rosin, are carefully ground into a paste with linseed oil varnish. The cement is good only after several hours, but is then excellent for either salt-water or sweet-water receptacles.

CALIFORNIA leads in barley, grape, sheep, gold and quicksilver production.

Passing Events.

The persistent rains keep on, and although insuring a prosperous year to California, are, for the time, inconvenient, causing, as they do, washouts, local floods and cessation of most out-door work.

It is stated that the President has decided to send a special message to Congress, in which an unequivocal indorsement of the Windom plan of dealing with silver will be given. We published Secretary Windom's ideas on this subject at the time he made his report.

The Utica mine disaster is still the topic among miners. It does not appear that there is any possibility of getting at the bodies of the miners for months to come, on account of the great mass of rock and debris that cover them.

The snowfall of the present winter is ample to furnish an abundant supply of water for the mills and mines all over the country the coming season.

The bullion yield of Chollar ore crushed at the Nevada mill the current month will exceed \$30,000. Blanket-silver men in Six-mile canyon complain that the tailings from Chollar ore pulp are very thin, and contain a very small percentage of quicksilver, which indicates that the Chollar and Hale and Norcross ore is being worked to a much higher percentage of its assay value than last year.

Windom's Silver Policy Defended.

In a late telegraphic interview, Director Leach of the United States Mint throws more light upon Secretary Windom's silver policy and answers at length the charge of the MINING AND SCIENTIFIC PRESS and reiterated by Eastern journals, that too much power would be given the Secretary of the Treasury by allowing him to temporarily suspend the right of deposit of silver bullion, receiving treasury notes in return at the market value of the bullion, when he thought a corner was being run against the Government. As put by the Director of the Mint, the secretary appears justified in asking for such discretionary power after the price of silver bullion is forced above \$1 an ounce Government standard. To understand this to better advantage, it is necessary to state that the Government standard is 900, or nine-tenths fine; the English standard is 925, and ounce fine is 1000. All prices for silver bullion are based on its relative fineness to 1000 fine, so that in reality \$1 an ounce Government standard brings the bullion up to about par, so that the power asked for does not appear to be unreasonable, seeing that with other safeguards he can only use it when the price is advanced abnormally above \$1 an ounce standard.

While the PRESS is not fully committed to Secretary Windom's policy, yet we must admit that under the very general discussion which it has inspired, his views have found favor with the conservative classes at home, and are finding friends abroad even with leading mono-metallists who begin to see that bimetalism is one of the inevitables. So unmistakable are the signs that mono-metal papers are hedging and consequently carefully preparing the way for espousing bi-metallism. In witness of this assertion, we give the following from the London Money:

It was expected in many quarters that the message to Congress from the President of the United States would recommend a larger use of silver as money, and that even if an unlimited coinage were refused, the full limits under the Bland Act would be reached; that is, that \$4,000,000 would be coined every month instead of \$2,000,000. On the other hand, there is a party which would prefer to have no silver coined at all, except as tokens for petty transactions; in short, there are mono-metallists and bi-metallists in the United States as well as in Great Britain. There is also some such division as we see at home in the headquarters of each school. Here the bi-metallists are very strong in Lancashire, and comparatively weak in London. In the United States they are very powerful in the West, and less powerful in New York.

After reviewing at some length the President's message so far as it refers to silver, it gives expression to the following on Secretary Windom's silver policy:

Mr. Windom proposes to issue notes on the deposit of silver at the market value. The more discreet bi-metallists in this country also make an identical proposal. If notes of £1 and £2 were issued against silver at the market value, our currency would be increased by several millions and so much gold set free for external commerce. Every one knows that the gold now in circulation is insufficient for the increasing trade and growing population of this country, and in spite of all the fluster and bluster about gold mines in South Africa and elsewhere, we shall for many years continue to be short of gold. There are two alternatives before us: we may wait for a period of bad trade, in which there will be less demand for money, or we may make a limited and moderate use of silver by means of small notes for internal circulation. As to payments abroad, gold must go to whom gold is due, and silver to whom silver. But the use of ten millions in silver certificates would raise the value of the rupee and greatly assist trade. If President Harrison can see his way to adopt Mr. Windom's suggestion, it is very likely that Mr. Goschen will see his way to a similar policy in England.

THE Nevada mill is crushing about 4500 tons of Hale and Norcross ore monthly, and had it not been for the falling off of the assay value of the ore from \$30 to \$22 per ton—the average given in the last weekly report—the bullion yield for the current month would have reached nearly \$120,000. The average for the month will not fall far short of \$25 per ton, which, calculating that 85 per cent of the assay value is saved, will give a total bullion yield of \$100,000 for December.

MARTIN C. FISHER, a mining engineer well known in Colorado and California, died in London on the last day of the year. He was one of the organizers of the Richmond Consolidated Mining Company.

Prevention of Mine Accidents.

The fatal accident at the Utica mine, in Calaveras county, caused by an immense cave, has brought up a discussion on the proper methods of timbering in mines and the prevention of accidents. It does not appear, however, that there was any neglect in the timbering of this mine. On the contrary, a skilled timberman, selected for his special knowledge, and aided by a special set of men, had charge of this part of the work, and was given every facility to do his work properly. Timbers of very unusual size were employed, since it was known these were necessary in this mine. From all accounts, however, no system of timbering known to us could have withstood the pressure of the 50,000 or 60,000 tons of rock which caved.

In this country we have no Government or State officials to inspect mines and see that proper precautions against accident are taken. In Great Britain, since 1835, there has been a succession of Royal Commissions and of Parliamentary Committees collecting and weighing the results of experience and the views and opinions of miners, experts and mine managers. In 1850, Government mine inspectors were appointed to carry out certain important general rules for the conduct of mines.

Even with all the precautions adopted in that country it does not seem that in the matter of preventing falls of roofs or sides and caves in mines, they have been able to do much with reference to the inspection of mines for the purpose of ascertaining whether the roof or sides are safe. Mr. A. R. Sawyer, one of the inspectors, who is an authority, points out that the universal practice of tapping the coal or stone with some heavy tool and judging of its condition by the hollowness or deadness of the sound and by slight vibrations, felt on placing the hand against the surface while the tapping is being applied, although good, it is not to be relied on implicitly; especially in the case of rock roofs and long pieces. It has often been stated by witnesses at inquests on deaths from caves, that the roof had been sounded shortly before the accident, and considered perfectly safe. Many accidents would be avoided, if, in addition to the tapping test, the roof were carefully inspected for the purpose of detecting natural dislocations, such as faults or slips or defects developed by the working, and if the bearing, the inclination and the frequency of occurrence of slips were studied by mining officials, the timbering being regulated accordingly.

In mines such as the Utica, and many others that might be mentioned, there is no question that unremitting, careful and intelligent inspection, and the continued devotion of skilled labor to the liberal provision and maintenance of reliable supports, even when their necessity may seem open to question, constitute the best safeguards against accident. In this case there was provision of special labor and supervision for the application and maintenance of timbering in the mine generally. Every facility and encouragement was given for good work in the timbering. The unfortunate man in charge doubtless had faith in his work, for he himself was with the timber-gang when the cave occurred, and he lost his life with theirs. The whole ledge caved from top to bottom, evidently sliding down bodily. No one could have foreseen such an accident, though the mine is one which needed special timbering, and the heavy rains had added weight to the upper mass.

THE GUADALUPE QUICKSILVER MINE.—Commissioner Houghton of the Circuit Court has reported the sale of the property of the Guadalupe Quicksilver Mining Co., which was foreclosed to the Farmers' Loan & Trust Co. of New York City for failure to pay the interest due on coupons maturing on January 1, 1884. The loan was for \$500,000 in bonds issued by the trust company. The court issued a decree allowing the quicksilver company until October 1, 1889, in which to pay its indebtedness, and on its failure to do so, December 7th was fixed as the day of sale. The property was sold to Maria Coleman, the highest bidder, for \$378,700.

THE Sunflower mine, Pike City, Sierra Co., started up last Monday with about 20 men at work. Mr. T. E. G. Wolleb has gone up to the mine as assayer.

Mexican Silver-Lead Ores.

The exportation of silver-lead ores from Mexico to the United States practically began at Paso del Norte in 1884, upon the completion of the Mexican Central R. R. The ore trade rapidly assumed large proportions under the decision of the Treasury Department at Washington establishing a value standard rather than a quantity standard for the determination of the classification of ores.

The scarcity of lead-fluxing ores in the central and southwestern mining regions of the United States, and the rapid extension of the business of smelting ores of the precious metals, had caused a demand for fluxing ores out of all proportion to the supply in the United States.

There were found in Mexico very extensive deposits of lead carbonates, and not infrequently associated with a lime and iron gangue or matrix. These carbonates have a wide range in their silver and lead values, carrying from 15 to 50 per cent of lead and from 10 to 100 ounces of silver. In many cases high lead percentages are associated with low silver values.

The presence of lime and iron in quantitative excess makes these ores from Mexico very desirable, not so much for their silver and lead values as for the actual work such ores will perform in the smelting furnace. As an evidence of the wide distribution of these Mexican ores in the United States, they were shipped to Pueblo and Denver, Omaha, St. Louis, Kansas City and Newark, N. J., as well as to points in New Mexico and along the frontier, where large smelting plants have been erected to treat Mexican ores in connection with dry or non-lead ores from New Mexico and Arizona. No complete data are at hand showing annual value and tonnage of this ore trade, but from a calculation based upon the export ore tonnage entering the United States at Eagle Pass, Tex., the total annual shipments for fiscal year ending June 30, 1889, will approach \$1,500,000 in value.

The U. S. consul at Piedras Negras says the outcry in Mexico against the U. S. Treasury circular of July 17, 1889, comes principally from men engaged in the silver-lead ore trade who have suddenly lost their market and have large sums of money invested in Mexican mines; these men are principally Americans. The railroads are also heavy losers in ore freights, notably the Mexican International, the only railroad at present in Mexico said to be owned solely by American capital. The Mexican Government some years ago seriously considered the advisability of imposing an export duty on raw Mexican ores, so as to build up reduction works in Mexico, their only doubt being the question of fuel. With the development of the Sabonas coal-fields in the State of Coahuila, near the line of the Mexican International Railway, and the fair grade of coals made from the Sabonas coal, Mexico is now able to smelt her own ores. The American miners will be very glad to have her begin its operation and keep her raw ores at home.

A Nicaraguan House.

The canal projectors contend that Nicaragua is the greatest existing field for American enterprise. However that may be, we shall all hail with delight the commencement of practical work on that great engineering scheme. Since the virtual collapse of the Panama canal this Central American offers the only location possible for a ship canal between the Atlantic and Pacific oceans. The reason is two-fold. Firstly, the interruption of the great mountain chain, extending practically from Valparaiso to the Mexican frontier; secondly, that Nicaragua lies outside of the zone of calms, which would have rendered the Panama canal useless for sailing ships. The people of Nicaragua have a type of house—such as is shown in the engraving on our first page—much like that in which the Mexicans of California lived before the advent of the Americans. It is of adobe with tiled roof and an arched corridor or porch around it. Senator Stanford has adopted this general style for the buildings of the Leland Stanford University, thinking it best fitted for the climate. The buildings are of one story, with arched corridors, hnt stone takes the place of the Mexican adobe. Such structures are warm in winter and cool in summer. There are still numbers of such buildings standing in portions of California; a few of them being out toward the Mission in this city.

The Mining Belt of Peru.

The great mining region of Peru is a mountainous belt of country, running nearly the whole length of the republic, and comprising the two grand ranges of the Andes with the elevated table-lands between them. On the east of this belt are the extensive plains and fertile valleys of the Amazon and its tributaries. On the west is a narrow strip of coast 20 to 50 miles wide, for the most part a sandy desert, but producing abundant crops where irrigated, and here are found petroleum, salt, nitrate of soda in enormous amounts at the south, silver in a few localities, copper and other mineral products.

The Western Cordillera, running nearly parallel with the shore-line, rises like a wall on the eastern side of the coast belt, with passes from 15,000 to 18,000 feet high and peaks attaining 18,000 to 20,000 feet. Farther east, at a varying distance, is the Eastern Cordillera, composed of broken mountain ranges which, considered as one group, have a general parallelism with the western chain, but individually vary greatly in direction, sometimes running nearly east and west, in places projecting out into the Amazonian lands, or here and there curving around to unite with the western ridge, and with this inclosing immense inter-alpine plains. These general features are indicated in Fig. 1, which, with the description, we take from a paper on "The Topography and Geology of the Cerro de Pasco, Peru," read before the American Institute of Mining Engineers, by A. D. Hodges, Jr., formerly of this city, but now a resident of Boston.

The surface of the plains is uneven and traversed by lower ranges of hills which surround large lakes, or rolling pampas or fertile valleys, and through many of these last run rivers of considerable size. The whole country has a high altitude (averaging up to 15,000 or 16,000 feet), and slopes gradually north and east toward the Amazon, into which drain all the rivers. Its boundary mountain chains are scored on all sides by narrow, picturesque and precipitous ravines often thousands of feet deep.

In all parts of this region are deposits of val-

ment and of capital, this region has produced, according to Homholdt, an average annual yield of \$5,300,000 in gold and silver.

The Plateau of Junin.

In the Department of Junin is a large mountain plateau encircled by the high Cordilleras,

From its northern end issues the Upamayo or Chinchao river, which, commencing to flow northerly, soon bends completely around, receiving the waters of the San Juan and the Colorado rivers, and then flowing southerly behind the narrow range of hills bounding the

the hills which here meet the lake, and some 600 or 700 feet above its waters. Here are the salt-mine and works which supply the Cerro.

North of the lake is the Pampa of Bomhon, the easterly division of which is often called the Pampa of San Juan. At the north-east of the Pampa of San Juan is the old town of Pasco, now nearly deserted, but said to have been formerly (before the discovery of the mines of Cerro de Pasco) an active mining camp. Directly west of Pasco, across the Pampa of San Juan, are the hill and once famous vein and mines of Colquijirca, where evidently much work has been done in times past, but where only spasmodic efforts at mining have been made of late, the ores being sulphureted and unsuited for the patio process.

Still farther north are the hills around Cerro de Pasco, familiarly known as "The Cerro," and at the extreme north or north-east of the plateau the Huallaja river, rising from springs near the last-named town, breaks through the Cordillera and flows north-easterly to unite with the Amazon.

(To be continued.)

Snow-Shoeing in Sierra.

EDITORS PRESS:—In the high Sierras, where snow falls to such great depths that other means of travel are out of the question, snow-shoe riding has been carried to a science. When Snow-shoe Thompson, who gained such celebrity in carrying the mail through Alpine and Placer counties, came to Sierra to show them how to ride, he could hardly keep up with the schoolboys. Since his day great improvements have been made, both in the groove that now runs the length of the shoe on the under side and makes it practical to guide the things, and in the lubricating material called "dope" that makes the rider glide down the mountains with each lightning speed.

Snow-Shoe Clubs.

The Alturas Club was formed at Howland Flat, and rivals were soon formed at La Porte, Port Wine, Poker Flat and Gibsonville. After practicing for weeks these clubs would send champions to contest for prizes, which were very liberal in amount, and were made the occasion of much outside betting. Races would generally continue for a week and occasion

which here unite to form the Knot of Pasco (Nudo de Pasco). In this plateau, which extends north and south some two degrees of latitude, are the large lake of Junin, the pampa

lake on the west, unites with the Huancayo river near Oroya, and passes out through the southern depression of the plateau to join finally the Amazon.

able minerals. Gold and silver have been mined from the earliest periods; the quicksilver deposits of Huancavelica were once famed throughout the world, although now practically abandoned; lead and copper ores have been worked to some extent; salt and coal have been discovered at many points; and iron and other useful metals are said to exist. Notwithstanding all the drawbacks arising from want of roads, of proper methods and appliances of mining, of skilled labor, of capable manage-

ment of Bomhon, and the famous "Besin of the Cerro," where, in latitude 10° 45' 45" south and longitude 78° 24' west of Paris is situated Cerro de Pasco, the capital of the Department. Fig. 2 is a map of this plateau, compiled with care from accurate surveys.

Lake Junin (also called Lake Chinchicocha and Lake of the Kings), a body of water with an area of some 200 square miles and an altitude of 13,390 feet above the sea, covers the southern and principal part of this plateau.

In the lake are several varieties of fish, and duck and other game-birds frequent it in numbers. Along its level easterly shore is good pasturage, and the breeding of animals is carried on here to some extent. At its southern end is Junin, a small town famous as the place near which the Peruvians won a great victory over the Spanish forces in the War of Independence. There are a few villages near it. The most important locality in the vicinity is San Blas, situated about half way up its western shore in

more excitement than any horse-races. Sometimes thousands of dollars changed hands on the result of a contest.

The Snow-Shoe.

Basket-work shoes are discarded entirely, and for racing the shoe is made the width of the foot and ten to fourteen feet long, turned up at the ends, with a groove about one-half inch deep by one and one-half inches broad running along the whole length of the bottom. Experts prefer those made from fir of very straight grain. The thickness at the center where the foot is fastened is nearly one and a

fourth inches, tapering to five-eighths at the rear and a little thinner in front.

The Training.

After the snow has covered rocks and underbrush out of sight, and has settled down to solid business, the boys begin to get out the snow-shoes and practice under instruction. The shoes are polished as smooth as they can be made, and then the bottoms are smeared with some preparation to increase the speed. This mixture is looked upon as the main thing in the race, and Ex-Senator Wallace is now mainly famous for his wonderful "dope" that won so many races. The base of all these preparations is sperm-ceti, but almost everything kept in a drug store has been experimented with. Most of these contain beeswax, rosin, turpentine, and some essential oils. It seems that the mixture must be adapted to the condition of the snow, and, above all things, must be kept secret from rival clubs. A little lard tumbled upon the bottom of a rival's shoes, or a little salt sprinkled on his side of the track, will lose him the race, and if you want a good fight on your hands in a hurry, get caught trying to find how a rival mixes his "dope."

For weeks excited groups will be discussing the merits of different mixtures for cloudy and for sunny days, for hard snow and for soft snow and for different hours of the day. There seems to be no regularly established course. A few days before the race they choose the place where they can get the longest and steepest run free from obstructions and convenient for spectators. Distance varies from 2000 to 5000 feet.

Speed.

Talk about your racehorses or lightning trains. These men are reported by concurrent testimony of many spectators to have averaged as high a speed as 250 feet per second over a course nearly a mile long. This is more than four times the speed of a racehorse or twice that of a locomotive. Remember, too, that either of the latter goes over the course at uniform speed, while the snowshoe rider moves with a constantly accelerating motion, and we may say that his speed at the finish approximates twice the average, or 500 feet per second. No wonder that they report that they hold the breath from start to finish, and cannot remember having seen anything but a sort of bluish white light while running. They use a pole resembling a churn-dasher for helping themselves uphill and as a brake at the finish. It is not supposed to touch the snow until the goal is passed.

In Minnesota the Norwegians make "ski-racing," as they call it, a leading winter sport, and an expert from the old country sometimes makes a sensation, but one never heard of the groove there nor of the "dope." Sierra stands ahead.

F. S. C.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
M. D. SHADLER—Santa Clara Co.
W. W. THORNTON—Los Angeles Co.
E. FISCHER—Central California.
GEO. WILSON—Sacramento Co.
E. H. SCHAEFFER—Fresno Co.
C. EDWARD ROBERTSON—Humboldt Co.
FRANK S. CHAPIN—Butte and Yuba Cos.
WM. H. HILLBARY—Oregon.
E. E. DRENNING—Oregon.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS 123 California St., San Francisco.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

FOR RENT, CHEAP.

BRICK BUILDING at corner of Folsom and Nineteenth streets, in subdivisions, floors or parts of floors. Will furnish power and give leases.

CHARLES ASHTON,
411 Montgomery Street, S. F.

417,894.—LEAK STOPPER FOR VESSELS.—W. Winchester, Mare Island, Cal.

The following brief list by telegraph, for Jan. 1, will appear more complete on receipt of mail addresses:

California.—Mark Anthony, San Francisco, station indicator; the same, street or station indicator; John W. Brown, San Francisco, section bridge; Joseph P. Deschamps and R. Mortimer Peters, sash lock; Calvin Ewing, San Francisco, collar-stuffing machine; Isaac S. Goldman, Los Angeles (assignor of part to H. Timkin and R. B. Leare, San Diego), organ motor; S. R. Hackley, San Francisco hydrant coupler; Andrew G. Norton, Arroyo Grande, windmill; Alonzo P. Fayson, San Francisco, setting speed and gauge for dredgers; John Ringen, Coronado, apparatus for utilizing euri-power; James H. Whitburn, Los Angeles, hydrocarbon burner.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MUSTACHE-HOLDER.—W. H. Masterman, Alameda. No. 417,876. Dated Dec. 24, 1889. The object of this invention is to provide a simple, effective and readily applied guard, which will easily and accurately fit the face and pass over the mustache, holding a portion of it back firmly and compactly against the lip and cheeks, whereby it is kept out of the way in eating, and especially in partaking of liquid food, each as snip.

VINEYARD PLOW.—John A. Bilz, Pleasanton, Alameda Co. No. 417,855. Dated Dec. 24, 1889. This is a novel construction for plows which is specially adapted for cultivating the soil where there are rows of vines, shrubs or trees and where it is necessary to plow close to the roots or stems while maintaining the beam and handle of the plow at a considerable distance to one side in order to avoid the limbs and upper portion of the plant. It consists in the combination of a reversible plow, a beam to which said plow is connected and about which it may be turned, and handles and clevis made adjustable with relation to the beam, so as to stand at any desired angle thereto.

TAG-HOLDER.—Samuel Bauman, Santa Cruz. No. 417,852. Dated Dec. 24, 1889. The device is intended for marking goods in dry-goods stores, such as are known as piece-goods. The invention was described and illustrated in the PRESS of Dec. 21st last.

VENTILATOR.—Peter Abrahamson, S. F. No. 417,851. Dated Dec. 24, 1889. The invention relates to that class of ventilators in which a box having an opening on each side is employed. The object of the invention is to provide a simple and effective ventilator providing for the free and uninterrupted passage of the incoming and outgoing currents, thereby effecting perfect ventilation.

DELIVERY ATTACHMENT FOR CAN-MACHINES. Joseph Black, S. F. No. 417,856. Dated Dec. 24, 1889. This is a delivering device used in connection with can-machines by which the cans are taken from the machines proper and delivered at any given point. Though the invention is applicable to any can-machine, from which it is required to receive the cans in a horizontal or inclined position and to deliver them in an upright position, it is especially applicable as an attachment for a soldering machine, in which the cans are rolled in a suitable way or trough through a bath of molten solder therein. The invention consists in the novel combination of the guide or tracks and the traveling carrier. The object of turning the can on end is to enable the solder to set better while the can is in an upright position, than if it were continued in an inclined position, as it

will set more evenly around the flange on the end of the can, and as the cans are carried along on the belt the solder has time to cool.

GATE.—Arthur W. Edwards, Shingle Springs, El Dorado Co. No. 417,861. Dated Dec. 24, 1889. This is one of that class of gates in which the gate is mounted by means of suitable rollers upon a tilting track, whereby it opens and closes by gravity, according to the direction in which the track is inclined. The patent covers details of construction and certain combinations of devices.

MINER'S CANDLESTICK.—Gustavus Peterson, Tuscarora, Nevada. No. 417,882. Dated Dec. 24, 1889. The invention relates to that class of miner's candlesticks in which are combined a spear or piercing stick or bar, a hanging up hook, a socket for the candle, a fine-cutter and a cap-cripper. The patent covers the novel arrangement and construction of these several parts in a single candlestick.

FRUIT-CUTTING AND PITCHING MACHINE.—Luke Sanguinetti of Vallecito and W. T. Stevenson of Douglas Flat, Calaveras Co. No. 417,885. Dated Dec. 24, 1889. The invention consists in a novel knife for cutting the fruit and provided with teeth for engaging the pit or stone, a rotary feed-wheel provided with pins or points for engaging the fruit and carrying it down upon the curved knife, a hopper for directing the fruit to the wheel, a feed-hook for controlling the feed of the fruit and a vibrating screen for separating the pits from the cut fruit.

BOOK REST.—Wm. C. Dow, Fresno. No. 417,860. Dated Dec. 24, 1889. The invention consists in the novel extensible and contractible frame, the stops for the book-covers, the adjustable leaf-holder and line-marker, the adjustable supports and details of construction and arrangement. The object is to provide a simple book-rest adapted to be adjusted to different sizes of books and which is provided with a means for holding the leaves open and marking the lines in copying.

SCOURING, GRINDING, POLISHING AND SMUTTING COMPOSITION.—James C. Holloway and John Frey, S. F. No. 417,866. Dated Dec. 24, 1889. This is a new and useful composition of matter, the general object of which is to grind, and the particular object of which is for use in machines for smutting, scouring and polishing grain. The mixture is applied to the circumference of a light iron cylinder, until it is coated to a thickness of about one inch or 1½ inch. This cylinder is then placed in an oven and allowed to remain for about 12 hours under a high degree of heat. It is then taken out and while the coating is still hot and its pores are open, they pour over it some of the liquid extract of eucalyptus until the composition refuses to absorb any more, the cylinder being revolved during the application and until the extra coating or supply of extract is dry. This last application of extract of eucalyptus completely fills up the pores of the composition and renders the absorption of moisture impossible, and the solidity of the whole composition is increased. Silica is used in the composition to act as a cutting or grinding surface of a frictional nature, the other material serving as a bond for holding the particles of silica together, and being of a softer nature it wears away more rapidly, leaving the sharp edges and points of the silica particles projecting from the composition which, thus by friction, operate to effect the result desired.

COMBINED HARVESTER.—James and William Paterson, Stockton. No. 417,936. Dated Dec. 24, 1889. The patent on this traveling harvester and thrasher covers a main frame upon which the thrashing and cleaning mechanisms are supported, a single driving-wheel for communicating power to said mechanisms, a pole rigidly secured to the frame and extending in front, a swiveled-wheeled frame supporting the front end of the pole, means for the attachment of a team to said swiveled frame, and for the attachment of a second team between the machine frame and swiveled frame, a timber rigidly secured to the right side of the main frame, and extending at right angles thereto, a non-driving wheel at the outer extremity of said timber, a header-frame snepended from said timber so as to swivel thereon, and a means, comprising a hell-orank lever, chain and pawl and rack, for raising the front of the header frame.

WATER-WHEEL.—Chas. J. Green, Placerville. No. 417,865. Dated Dec. 24, 1889. This improvement in momentum or hurdy-gurdy wheels consists in buckets adjustably arranged upon the wheel-rim, and so placed with relation to each other that a certain proportion of water from the nozzle is discharged into the bucket nearest to the nozzle, while the remainder strikes the bucket just behind the first one; and also in a means for adjusting these buckets so as to change the proportion of water which is discharged into the first and second buckets. In this class of wheels the buckets are made of such a form that the water which is discharged from the nozzle under a high pressure is received into the buckets so as to pass around the concavity of the bottom and be discharged at the outer edges, thus being a common form of construction in several well-known wheels. In this invention Mr. Green improves the construction of the wheel by making these buckets transversely adjustable to

and from the center of the rim of the wheel and placing them with relation to each other, so that the stream of water is always divided between two buckets, one of which is behind the other.

CENTRIFUGAL AUXILIARY PROPELLER.—Robert Stevenson, S. F. No. 417,888. Dated Dec. 24, 1889. This is a device for assisting in the propulsion of vessels through the water. It consists of radial blades or wings, having the exterior edges either tapered or in straight or curved lines from front to rear, and secured to a shaft projecting from the bow of the vessel and beneath the surface of the water, so that when driven at a high rate of speed the centrifugal action of these blades will throw the water outwardly and produce a partial vacuum or open space in front of the bow of the vessel, into which it may be moved or forced with less expenditure of power than when the vessel is moved into water in its ordinary condition. This invention was illustrated and more fully described in the PRESS of last week.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

GUATEMALA & CALIFORNIA CONS. CO., Dec. 27. Object, to receive concessions from the Government of Guatemala, buy and sell real estate in that Republic, import into and export goods therefrom and manufacture goods there. Capital stock, \$1,000,000. Directors—Mrs. M. R. Crosswell and Mrs. M. L. Crawford of Guatemala and John B. Turilli, R. B. Brower and John Lee of this city.

ALASKA COAL CO., Dec. 27. Capital stock, \$2,000,000. Directors—E. M. Patterson, B. E. Handy, W. H. Craig of Oakland, and L. B. Hatch and D. C. Gray of S. F.

NORTH AMERICAN COMMERCIAL CO., Dec. 31. Object, to hunt fur-bearing animals and sell the skins; also, to deal in lands and construct heats and other apparatus necessary for hunting and transportation purposes; also, to build all kinds of buildings for the purposes expressed; also, to purchase and sell all kinds of machinery, goods, wares and merchandise; also, to construct, purchase and operate trading-posts. Capital stock, \$2,000,000, in 20,000 shares. Directors—Lloyd Tevis, Henry Cowell, Albert Miller, Matthias Meyer and Isaac Liebes.

ECONOMY BUILDING AND LOAN ASSOCIATION, Dec. 31. Capital stock, \$1,000,000. Directors—Barry Baldwin, Moses Blum, James K. Wilson, William D. English, H. R. Willis, Geo. D. Toy, Bernard Faymonville, Isaac Anderson and Charles G. Clinch.

INSTALLMENT HOME ASSOCIATION, Dec. 31. Object, to deal in real estate and the construction of homes. Capital stock, \$5,000,000. Directors—Felix Marquis, A. S. de Gue, A. G. Southernland, M. B. Frost and Eugene F. Bert.

SAN FRANCISCO NOVELTY AND PLATING WORKS, Dec. 31. Object, to manufacture and deal in amalgamating plates and other articles for commercial use. Capital stock, \$30,000, in 300 shares. Directors—Andrew Rudge, Isaac N. Demorest, William E. Sheepman, Isidore M. Merle and Adrian J. Merle.

POPULAR RAILROAD GUIDE CO., Dec. 31. Object, to publish a railroad guide and hotel directory. Capital stock, \$25,000. Directors—J. Oliver Evans, Talliesin Evans, John L. Bromley, Fred L. Button and Arthur F. Price.

POSO CREEK LUMBER MILL, Dec. 31. Capital stock, \$100,000. Directors—Meyer Ehrman, Chas. Green, Samuel Sussman, John Alexander Campbell and Joseph Ehrman.

APOLLO CON. M. CO., Dec. 28. Capital stock, \$2,000,000. Directors—G. C. King, W. W. Gollin, R. Neuman, L. Sloss and G. Niebaum.

Meetings and Elections.

Annual meetings and elections have been held by the following mining companies:

PEER M. CO., Dec. 26: W. S. Lyle, president; C. H. Fish, vice-president, and J. B. Low, A. B. Clute and E. Gauthier, directors. Aug. Waterman was re-elected secretary, and William Pickett, Supt.

PEERLESS M. CO., Dec. 26: William S. Lyle, president; C. H. Fish, vice-president, and J. B. Low, A. B. Ruggles and E. Gauthier, directors; Aug. Waterman, secretary, and William Pickett, Supt.

WELDON M. CO., Dec. 26: William S. Lyle, president; C. H. Fish, vice-president, and J. B. Low, A. B. Ruggles and A. B. Clute, directors; Aug. Waterman, secretary, and William Pickett, Supt.

COMBINATION M. CO., Dec. 26: William S. Lyle, president; C. H. Fish, vice-president, and J. B. Low, A. B. Clute and A. B. Ruggles, directors; Aug. Waterman, secretary, and William Pickett, Supt.

THE Southern Pacific Co. paid taxes amounting to \$582,159 this week. The whole amount of taxes for the year 1889 charged upon the railroads assessed to the State Board of Equalization was \$668,024.45, of which \$292,328.06 was for State purposes and \$375,696.09 for counties through which the roads run. Of these taxes, \$667,778.37 has been paid, leaving \$245.78 delinquent, which is due from the Pullman Palace Car Company, the only company assessed by the State Board of Equalization which failed to make payment of its taxes.

THE CALIFORNIA WIRE-WORKS have discontinued the retailing-branch of their business and moved their main office to the factory, 332 Bay street, corner of Mason. The city office has been established at No. 9 Fremont street.

TELEGRAPHIC dispatches state that a very rich deposit of olivine ore has been found 30 miles from Tacoma, Washington.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, Dec. 28, \$18,770; Justice, 28, \$5670; Hanauer, 24, \$4750; 25, \$5100; Young America South, 27, \$8600; Hanauer, 27, \$4800; Chollar, 31, \$13,736; Hanauer, 28, \$2350; Mt. Diablo, 28, \$10,831; Savage, 28, \$22,315; Alice, 27, \$23,848.

DELINQUENT SALE NOTICE.

Booth Gold Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Auburn, Placer Co., Cal. NOTICE.—There is delinquent upon the following described Stock, on account of Assessment (No. 4), levied on the 23d day of November, 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

NAME.	No. Certificates.	No. Shares.	Amt.
Richard Chenery, Trustee.....	110	6,275	\$125 50
Richard Chenery.....	17	5	10
Charles F. Eaton.....	171	300	6 00
Charles F. Eaton.....	172	300	6 00
Charles F. Eaton.....	173	60	1 20
R. N. Graves, Trustee.....	25	250	5 00
E. S. Harrison.....	177	1,000	20 00
Geo. R. Salency, Trustee.....	32	312	6 24
O. R. Spinney, Trustee.....	176	500	10 00
E. P. Slosson, Trustee.....	181	500	10 00

And in accordance with law, and an order of the Board of Directors, made on the 23d day of November, 1889, so many shares of each parcel of such Stock as may be necessary, will be sold at public Auction, at the salesroom of Middleton & Sharon, No. 22 Montgomery street, San Francisco, California, on MONDAY, THE TWENTY-ETH (20th) DAY OF JANUARY, 1890, at the hour of 3 o'clock P. M., of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

OEO. R. SPINNEY, Secretary.

Office, 310 Pine St., Room 23, San Francisco, California.

PRACTICAL

Books on Mining AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warren Lock. 758 pages, with 8 plates and 271 engravings in the text. 4to, cloth, \$15.00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information collected during four and a half years of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrage, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 25 plates and numerous engravings in the text. Price \$15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico. By C. G. Dahlgren. Price \$1.00.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

E. & F. N. SPON, Publishers,
12 Cortlandt St., New York.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron hangers for top saw. Friction feed-works, patent steel screw double-throw head-blocks, with track iron, saw carriage and frame complete.

RISDON IRON & LOCOMOTIVE WORKS,
San Francisco, Cal.

DIVIDEND NOTICE.

The German Savings and Loan Society.
526 California Street.

For the half-year ending Dec. 31, 1889, a dividend has been declared at the rate of five and forty-hundredths (5 40/100) per cent per annum on Term Deposits, and four and one-half (4 1/2) per cent per annum on Ordinary Deposits. Payable on and after Thursday, Jan. 3, 1890.

GEO. TOURNY, Secretary.

DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION, 532 California St., cor. Webb. BRANCH, 1700 Market St., cor. Folk. For the half-year ending with the 31st of December, 1889, a dividend has been declared at the rate of Five and Four-tenths (5 4/10) per cent per annum on term deposits and Four and One-Half (4 1/2) per cent per annum on ordinary deposits, free of taxes, payable on and after Thursday, the 2d of January, 1890. LOVELL WHITE, Cashier.

THE BATTLE OF GETTYSBURG,

On Market St., corner of Tenth, is the most realistic and interesting picture ever produced. Read what General Howard says of it in our Catalogue.

Open, 9 A. M. to 11 P. M., Except Sundays.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,
8 Market St., N. E. cor. Front (up stairs), San Francisco. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

**JAMES LEFFEL'S
Mining Turbine Water Wheel.**

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globs Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Jan. 2, 1890.

The year 1889 closed on a close money market, and also on a dull market in all branches of trade. The close money market was due to heavy remittances to the East in October, November and the fore part of December, aggregating about \$10,000,000—real estate speculation—and toward the close of December to the paying of taxes and the calling in of money for the payment of dividends, interest, etc. The transfer last week to this city of about \$1,500,000 from New York had a beneficial effect. It is the prevailing impression that before the end of January the money market in this city and the State at large will be very easy under free disbursements on interest and dividends, and the payments by the State and different cities and counties from funds received from taxes.

The Eastern money market has been very close, with high rates of interest reported. Leading Eastern exchanges report that the outlook is favorable for an easy market after the turn of the year, as the general disbursements will be heavier than for years.

The local dividends for December compare as follows:

	1889.	1889.
Banks.	\$63,000	\$63,000
Gas and water companies.	\$128,350	\$128,350
Insurance companies.	8,000	14,500
Power companies.	27,000	27,000
Street railroad companies.	25,000	25,000
Sugar companies.	35,000	35,000
Mining companies.	25,250	25,250
Miscellaneous companies.	31,250	35,250
Totals.	\$502,850	\$572,750

MEXICAN DOLLARS—The market has ruled dull throughout the week at about 75¢/75½¢ cts. The stock here is reported to be large, considering the nature of the demand. If China, as reported by cable, decides to coin silver, as is being favorably considered, the demand for Mexican dollars will not be so large.

SILVER—The market has ruled dull and heavy throughout the week. The fall in sterling exchange has been against the market. The prospects are of a most flattering character, based on the following: The English Government will increase the currency of that country by the reinstatement of the two and a half sovereign and the coining of more silver; more coining by France, silver coining by China, and an increase in the silver coinage of the other countries which either use silver exclusively or in conjunction with gold. It is now a foregone conclusion that at the present session of Congress there will be favorable legislation on silver—either increasing the purchase for monthly coinage to \$4,000,000, with free coinage after the market price reaches par, or else a don't plan. This plan we gave in the Press on Dec. 14th, which is briefly as follows: To open the mints of the United States to the free deposit of silver, the market value of the same (not to exceed \$1 for 472.5 grains of standard silver) at the time of deposit to be paid in Treasury notes, said notes to be redeemable in the quantity of silver which could be purchased by the number of dollars expressed on the face of the notes at the time presented for payment, or in gold, at the option of the Government, and to be receivable for customs, taxes and all public dues; and when so received they may be reissued, and such notes, when held by any national banking association, shall be counted as part of its lawful reserve.

The United States silver standard is 900, which is one-tenth less than the commercial basis of 1000 fine. At \$1.40 ounce of 900 fineness (Government standard), the price would be over \$1.29 per ounce fine.

To-day (Thursday) silver is stronger and higher, being quoted here at 96 cents, with no sellers, and in London at 44½d.

QUICKSILVER—Receipts the past week aggregate 214 flasks. The market is quiet but steady.

BORAX—Receipts the past week aggregate 564 casks, and exports by sea 216 lbs. to Guaymas. The market is firm at full quotations.

LIME—Receipts the past week aggregate 2535 bbls., and exports by sea 400 bbls. to Honolulu, and 200 bbls. to Guaymas. The market is dull but steady.

LEAD—The market is reported steady, with the usual demand at this season of the year. The East reports a strong tone to the market.

TIN—The spot market for both pig and plate is unchanged, but for shipment the feeling appears to be stronger. The stock of pig abroad is quite light.

COPPER—The past week 47,000 lbs. copper matte was shipped to Liverpool. The market is very strong for all grades. Mail advices received from New York report heavy sales of Lake at 14½ to 14¾ cts. per lb. for delivery in the fore part of 1890. The consumption the world over is increasing, with France and Germany taking more freely than before. In France extensive works are being constructed to prepare sulphate of copper, using over 10,000 tons of copper to turn out 40,000 tons of sulphate of copper. As this goes into the ground for the destroying of phylloxera and other vine diseases, it sinks forever, not returning in the shape of old copper, etc.

IRON—Imports the past week aggregate 200 tons of pig from Liverpool. The local market is quiet but firm. Holders are firm in their views owing to the strong market abroad. A Philadelphia exchange says: "Ten years ago the United States was making about 3,000,000 tons of pig iron per annum; now we are making 8,500,000 tons, with prospects of a still larger production during 1890. Ten years ago, when prices began to advance, we were flooded with foreign iron, equal to nearly one-third of the domestic supply, while old rails, scrap, etc., came in almost endless quantities from all quarters of the globe, to say nothing of finished iron, steel rails, and other material. Now with a greatly reduced tariff, we are importing practically nothing, while at times our iron-masters have

seriously considered the possibility of their being able to export iron."

COAL—Imports the past week aggregate as follows: From Seattle, 7645 tons; Tacoma, 450; Nanaimo, 2200; Port Moody, 1450; Coos Bay, 450; New York, 101; Departure Bay, 650; Liverpool, 199; Cliffstone, 200; Black Diamond, 1000; total, 24,395 tons. The market for spot is rather quiet, but some holders look for more activity soon, but while expecting a better demand, they do not look for any better prices, owing to the free stocks here and readily obtainable coast supplies. The rainy weather is against the free consumption of steam coals. For cargoes of Australian on passage and for shipment the market is quiet and reliable quotations, or, at least, "bottom fact" quotations, are hard to get.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Jan. 2, 1890.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	94½	94½	14 25	3 90	\$21.00
Friday	94½	94½	14 25	3 87½	21.00
Saturday	94½	94½	14 25	3 87½	21.00
Monday	94½	94½	14 25	3 87½	21.00
Tuesday	94½	94½	14 25	3 87½	21.00
Wednesday	94½	94½	14 25	3 87½	21.00

NEW YORK, Dec. 31.—Quicksilver closed easier at 68c. Pig lead is sparingly used at \$3.90. The copper trade is moderate; no weakness in prices. No pressure of offerings. Lake, 14¼¢; Montana and Arizona, 13¼¢; Casting, 12¼¢; London cables, strong; £49 17s 6d Merchant bars spot; 749 15s future.

Mining Share Market.

The mining share market the past week was fairly active, with lively and attractive fluctuations in the Comstocks, affording those able to secure the turns a good daily profit. The activity at the close of the year was not looked for, as the prevailing opinion has been and still is that we are to witness a lower range of prices, so as to force all the outsiders that it is possible into selling, after which have a deal. It is claimed that in this month the low prices will come. Experience has taught the more successful operators in buying to pay cash for the stock and not to hold for "big things" before selling, and also pay no attention to points. In outside stocks trading was light, notwithstanding well-circulated bull points, chiefly in the Tuscaroras. It is claimed by some of the better informed that another line of assessments is to be levied on the Quijoatas, Bodies and Tuscaroras, after which they will have a deal.

There can be no doubt but many of the mine managers are destroying the little confidence yet had in the mines by the persistency with which they grade the ore to lower assays and also by their not making public more details regarding the assays and the work going on in the mines. As a case in interest we give the following report of the average assay value of 2009 tons of Con. Virginia ore which is on file at the company's office in this city:

Gold.	\$1.00	Silver.	\$2.00	Total.	\$3.00
Per Car samples.	\$8,402	\$20,443	\$28,845		
" R. R.	9,106	20,287	29,393		
" Battery "	8,169	15,536	23,705		
Yield in bullion per ton:	Gold, \$9674; silver, \$12,335; total, \$22,010.				

The above report is dated at Virginia City, Nev., May 30, 1889, and signed, W. H. Lowell, clerk Con. Cal. and Virginia Mining Co. The report, as given above, affords stockholders a large degree of satisfaction, much more than are those now made, although W. H. Lowell still makes them out. By the reports now rendered stockholders are not allowed the privilege to see the car sample assays, nor are they allowed to know what percentage the mill returns to the mines. The report given above shows that the then contractor (Senator John P. Jones) returned 76 per cent of the assay of ores at the mines.

The reports of the Savage and Hale & Norcross mines do not return more than 70 per cent of the assays of ore at the mill, without saying anything about the loss in the assays of ore at the mines, which, if made public, would show a much larger shrinkage. Several of the other bullion-producing mines are managed in the same unsatisfactory manner.

The Hale and Norcross bullion product in 1889 was about \$600,000, no dividends; where did the bullion go? Savage's bullion product was about \$260,000, no dividends, but two assessments; Commonwealth's \$333,000, no dividend; Chollar's, about \$250,000, and \$112,000 paid in assessment, but no dividends. Several of the other mines show equally as bad. Con. Virginia's bullion product was about \$3,250,000 and dividends about \$1,020,000. Mt. Diablo's product was over \$400,000, and dividends about \$50,000. The total bullion yield of the mines listed on the two exchanges in this city was in 1889 about \$6,250,000, dividends about \$1,070,000, and assessments collected, about \$2,750,000. The above is not the best of showing for outside stockholders, for out of about \$9,000,000, only about \$1,070,000 were returned in dividends.

The market opened this (Thursday) morning dull and slightly lower. After the regular call the Comstocks strengthened, with an average advance of about 10 per cent recorded.

Reliable news from the Comstock mines continues hard to get. This is usually the case when stocks are being depressed so as to get them in as low as possible. Private information speaks, as heretofore, very encouragingly of the situation, and hopes are entertained of a new development soon. This development may be more in stock than in real game, so, if possible, to peddle out stocks. Official letters received from the Gold Hill mines were only received this morning from Challenge, Con. Imperial and Crown Point. The information about the work in the mines is about the same as given last week. Crown Point reports less ore sent to mill and the battery assays less. Letters from Hale and Norcross and Savage were not on file when the writer called. As private information from these mines

has been at variance with the official letter, the latter is not considered much. The work now going on in Union and Mexican, Ward shaft, Belcher, Seg. Belcher and Yellow Jacket deserves careful watching, as does that in Con. Virginia.

 Dewey Engraving Company, No. 220 Market street, San Francisco.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

Rose's Mechanical Drawing Self-taught.

FOURTH EDITION,
Thoroughly Revised and Corrected.
JUST READY!

Mechanical Drawing Self-Taught: Comprising Instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing together with examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions, Engines and Boilers. By Joshua Rose, M. E. Illustrated by 330 engravings. Fourth edition thoroughly revised and corrected. 8vo. Price, \$1.00

BY THE SAME AUTHOR:

Modern Steam Engines. An Elementary treatise upon the Steam Engine, written in plain language, for use in the work shop as well as in the drawing office; giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 422 engravings. In one volume, quarto, 321 pages. Price.....\$6.00

The Complete Practical Machinist. Embracing Lathe Work, Vise Work, Drills and Drilling, Tap and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 354 engravings. Fifteenth edition thoroughly revised and in great part rewritten. 12mo, 433 pages. Price.....\$2.50

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings. 12mo. Price.....\$1.00

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors; and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 250 pages. Price.....\$2.50

Illustrated Circulars, giving the full table of contents of all the above works, sent free to any one who will apply.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Our new revised Descriptive Catalogue of Practical and Scientific Books, 54 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.**NEW COMMON SENSE STEEL WHIM.**
All Complete for \$150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "husted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. If it is not your business or domain, it is your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

1850. — BUILDERS OF — 1888.

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

THE NEW BUILDING FOR THE CHEMICAL DEPARTMENT OF THE UNIVERSITY OF CALIFORNIA.

SCENE IN THE MARKET PLACE OF LEON.

Market-Place Scene in Nicaragua.

In the published Report of the U. S. Nicaragua surveying party, by A. G. Menocal, U. S. N., are a number of characteristic pictures of the country and cities of that region, one of which, the market-place at Leon, is herewith given. It is a type of the market-places of many Central American and Mexican towns, where there are open hoots for the sale of all sorts of articles. In some there is no roof around the sides of the plaza, as is here shown, but awnings are spread over the hoots, which are only temporary affairs, set up on market days, two or three times a week. We used to have these plazas in California years ago, but we have dropped the Spanish word, and now have the commonplace "square" in its stead.

The Chemical Laboratory Building.

An Addition to the University of California.

The Chemical Department of the University of California has suffered for lack of accommodations for some time, but a legislative appropriation of \$70,000 for a special building has remedied this, and ground has been broken and foundations laid for the structure. The new building, an engraving of which is shown on this page, is located south from the Mechanics' Art building, and it is expected will be completed this year.

Designs were drawn and plans made and the regents selected the design and plans as made by Mr. Clinton Day, the well-known architect of Berkeley. It is a radical and welcome departure from the commonplace forms of the structures already built, and will be a decided ornament to the University grounds.

The building will be of stone, brick and terra-cotta, and of the Victorian-Gothic style of architecture. It will be about 150 feet square, one story in front facing west, and two stories in height on the side facing south.

(Continued on page 29)

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Californians in Austria and Germany.

EDITORS PRESS:—We left Venice Saturday, 10th, 9:15 A. M., without any regrets, and I would not put myself out much to make it the second visit. Here, and the first place that I have seen on this tour, "distance lends enchantment to the view."

The artists of Venice get up some beautiful pictures, tinted with all the colors of the rainbow and set off with an Italian sky. Perhaps it would not look well for me to say all I think about Venice. I do not know that I have any complaint of the people. Let others go and see for themselves. We retraced our steps as far as Verona, through level and well-cultivated fields. Here we go to the north up through a rough, rocky canyon, with very high, barren rocky mountains—only now and then a small piece of land worth tilling.

We Arrived at Borzen

About 6 P. M. and put up at the Hotel Kaiserkrone. It is a little city of 12,000, nestled between two or more high mountains. After gently disposing of one of the best dinners we have had since we left Paris (we are in the Riesling wine district, so I thought I had better prepare myself to pass on the imitations of some of my friends when I returned). We took a walk through some of the crooked streets and arcades, preparatory to pleasant dreams.

I presume I have stated heretofore that we are traveling on Gaze & Sons' R. R. and hotel coupon tickets. Our route from Paris around to London is traced on a map by a blue pencil, and tickets are printed with each place where we desire to stop, and coupon torn off as we proceed. We bought hotel tickets for 15 days each. One coupon for bed-chamber, one for dinner and one for tea. We usually do, and always should, tell as soon as we arrive at hotel that we have these tickets, and they assign rooms accordingly. We neglected to do so this time, and business being a little dull with them, they assigned us the best rooms in the house, which we felt very comfortable in. When we made it known that we had Gaze's tickets, they said these rooms did not go with those tickets. They showed us others, higher—not in price, but altitude. We declined, and stated as our coupons were getting short, we would pay them cash and retain the rooms. We requested them to make bills in francs, as we had that money, not Austrian. Everything was pleasant about the hotel except settling the bill—not on account of excessive charges, but currency. They made their bills in florins, and it seemed impossible for them to reduce the amount to francs, when French, Italians and Swiss are passing here every day and must have more or less intercourse with them. Finally they computed each florin equal to two francs, and we paid the bills and took our change in some paper and some silver.

In the squabble to pay our bills, the ladies disappeared. After looking for them for awhile, some one muttered enough English to say gone. He went below and found that they had run them and the luggage down to the train. All the Jehu knew was to wield the whip and reins, and the moment he got a load, away he put for the station. When we arrived, the ladies were peering out of the station with anxious looks.

We started for Munich, via Innsbruck, in a rain, which very much disappointed us, as we expected to see the high, lofty mountains on the trip. The clouds came so low down in the mountains that frequently we could not see more than half-way to their tops. We could see the troubled river Adige hundreds of feet below us, looking more like dirty milk than water. We went through tunnels, over bridges and along the side of precipices to our hearts' content. I do not think any one of them was quite equal to Cape Horn, but there were so many grand ones that it kept us looking and explaining all the time. We passed some wonderful terraced vine lands. It seems almost incredible that men will spend so much time and labor in making a steep hillside productive.

Incidents of Travel.

At Kufstern, on the border between Austria and Germany, all the baggage had to be taken out of the cars, carried into the station, examined and stamped. As we expected to return to the same car, we left our umbrellas, awl-knives, rubbers, etc. All passengers are driven into the station like so many sheep and looked in until all are examined and ready to load again. As soon as the door is opened all rush out pell-mell to secure seats. Each one of our party took one or more grip-sacks and started to find our car, not knowing the train had been removed and a new one substituted. As soon as we discovered the train had been removed, we found part of our baggage gone, and we set up a search for that. Passengers were all on board, bell and brass horn had sounded, the guards were shutting the doors; half of our party ran one way and part in another, and would come together in the center like two opposing armies, one asking the guard where is my cane? another where is my umbrella? another to the conductor with high-

keyed voice, where are my rubbers? etc., they not understanding a word we said, while the passengers were highly edified. Finally two of the ladies who are always looking for things that are not lost looked into the baggage-room, and Mrs. F. saw two of Aunt Ellen's rubbers, and she snatched up one of them, and looked around and saw a woman with my umbrella and cane and field-glass, and wrenched them from her hands and ran for the train. Meantime Mrs. H. trotted in and loaded herself with endries and ran also. The conductor appeared on the scene and he took up one rubber and a fan cast away by former passengers, and he also ran for the car. Now the trouble was to get a seat, as everybody was on board and the cars in the act of starting. A section was finally found with a Dutch woman and little daughter at the door and a man at the other end. She was determined not to give way and let us in, but we crowded in all the same, still good-naturedly but excited. The conductor came to the door and gave her a severe talking and she quieted down a little. Her face looked to me as though she had been employed by Bismarck as a hog-hater and the hated object had reflected back in her face. It seems to me an important place like that where they change cars, passengers should be informed of the fact by a person that can speak a language that all can understand. This has taught us that when we get out of a car to take all luggage or else leave some one on guard. The surest way is to travel as J. Ross Brown did—clothes on your back and toothpick and toothbrush in pocket. I expect this experience on the border will furnish material to relate to our grandchildren in years to come.

Munich.

The capital of Bavaria, is a much larger and finer city than I expected. They claim 250,000 population. I should think it a little high. There are a good many government buildings, art galleries, museums, public halls and gardens here. The streets are well paved, some are straight and wide, and some narrow and crooked. Soldiers are everywhere, with their fine-setting blue frock coats, dangling swords, gilt bands on cap, and straight as an arrow. Women are shoveling up mud in street, sweeping street, cleaning railroad track, running handcars, with dogs to assist them, and handling material on top of a three and four story building, while men drive hacks, drink beer and smoke. I actually saw a boy, man and woman running. I think the boy ran to get warm, as his sleeves were rolled up and he looked cold; I think probably the man was a Innatio and had lost his mind; I think the woman ran to participate in the gossip or scandal that appeared to be going on around the corner. I saw an ox hauling a brewery wagon with kegs of beer; the yoke was padded and fastened in front and below the horns. They use a pole to a good many of their wagons instead of shafts, for a single animal. Most of the shafts to the hacks are hung on one side of the center, so that the horse shafts in front of the wheel, the same as sleigh-shafts are hung. The shafts are held up by straps from end to collar, instead of saddle.

In England and Paris stagings are built by lashing straight tall poles together by ropes. In Milan and Venice they use the tall poles, but fasten together by hoop-iron. In Munich they use tall ladders, fastened with ropes, and I think I have seen them 80 feet high. I have seen them, natural growth, without splicing, sticking over the top of a three and four story building.

There is a good deal of building going on and nothing looks dull or sleepy. The architecture does not present the sameness that it does in France. There is a liberal supply of bronze statues and fountains. The river Isar flows to the north on the east side of the city. It is about half as large as the Sacramento, and has a white, muddy color.

Our time was so short here I did not have time to investigate much. There is not one in a hundred that can speak English, and therefore original information is pursued under great difficulties.

The wind is blowing from the north very fresh to-day, and is quite cool. I am very glad now that I did not get thin clothing at Venice, or I should have had a worse cold than I have now. Changing clothing with climate is dangerous, if it is agreeable.

Heidelberg

Is a romantic little place of 26,000 inhabitants (they claim it) in a valley between the high mountains, either side of the river Neckar. The river, about the size of Sacramento, flows from east to west, and most of the city is on the left or south bank. The two notable things of this city are its University and castle. To the efficiency of the former, many a professional man in the U. S. can testify, and to the latter all tourists make pilgrimage, buy ample supplies of photographs, and take copious notes. I thought I had seen castle enough to last me my lifetime, but I am very glad that I took a look through this remarkable one with its remarkable history. It is of red oak granite, on the side of a steep hill, overlooking the city. It is wonderful in stairways, arches, towers, banquet and audience halls, promenades and dungeons. I saw the stone bed where they used to roast a whole ox at a time, and the tall chimneys that conveyed the smoke and simmering fragrance to the sky above. In the large arches underneath, where teams could drive in and turn around, are three large wine casks, two of which I supposed were the large-

est ever made. In going a little further along, I saw one called the "Great Tun," constructed in 1741, having an interior capacity of 49,000 gallons. The staves were from six to eight inches thick. The hoops were made of timbers either natural or stam bent, and not more than one foot apart. In the museum room were shown relics connected with the castle, such as ancient horseshoes, chains, forks, swords, spears, helmets, haws, guns, etc. On the southeast, or upper side, is a mammoth pile of the castle still clinging together, that was undermined and blown down by the French invaders in 1689. They must have possessed a remarkable cement and quality of lime to cause this mass of rock to adhere so tenaciously for such a length of time. Twice has this castle been rebuilt and burned. It is an interesting study to read its history and contemplate the vicissitudes through which it has passed. On the mountain-side north of the city, grapes are grown and the land is terraced all the way up.

A brick building is being constructed on the side of the hill among the grapevines, and among the laborers I counted eight or ten women packing brick to it in tubs on their heads. Two good bridges span the river—one modern, iron and stone, the other wholly of stone, with six or eight arches, with a good deal of raise to center of bridge, and built over one hundred years ago. At the approach on the left bank is an arch with two towers, and with figures appropriately inscribed. The Roman method of notation is employed on nearly all monuments, statues or buildings in Scotland, England or the continent, and we have to go back to our school days when we were taught that system to learn the dates. I saw a steamboat running on this river without wheel or screw, which seems almost as preposterous as a bird without wings. She is a tow for canal boats, and I presume there are rapids, which is the reason she is so constructed. A chain runs through pulleys at either end and around a clutch windlass in center of boat. One end of this chain is fastened up stream and one down, at what distance I do not know; the windlass revolved with steam power; the chain pulled in at one end and let out or overboard at the other—not a very speedy, but secure, way of traveling.

As we were out walking this morning down the bank of the river, we saw a number of wine-cellar built right from the street into the side of the hill.

D. FLINT.

Woodbury Concentrators.

EDITORS PRESS:—At the Hathaway mine, Newcastle, Placer county, they have made a number of tests in the past ten months between the Woodbury, Frue, Victor (or Shaw), Garnier and Gates concentrators and the systems of riffle-boxes and canvas tables. After these tests, the company concluded that the Woodbury suited them best, handling the most pulp (from five stamps), and they have placed four Woodbury concentrators in their mill to work the pulp from 20 stamps. Mr. Woodbury is here at present superintending the erection of his machines. The 20 stamps are now running and crushing 50 tons in 24 hours. Everything in and about the mine and mill is in good running order.

There are other mines starting up around here. The Hathaway Co. is talking about larger works, by putting up four of Dodge's No. 2 pulverizers, so as to see what the difference will be between the stamps and the Dodge machines.

J. P.

Newcastle, Placer Co.

Mining in Costa Rica.

J. R. Stevens, an old California and Nevada mining man, returned from Costa Rica on the steamer San Blas, where he has been for the past four months, examining various mining properties. Mr. Stevens does not appear to entertain a very exalted opinion of the country lying back of Punta Arenas.

"The mines I visited," said he, "are about four leagues inland from Punta Arenas, the seaport, and are at an elevation of about 1200 feet above the sea. There are two gold mines at that point, one called the Trinidad, worked on a small scale by an English company, and the mine of the Cerro del Aguacate, one of which is worked by a company called Compania de la Montana del Aguacate. There is still another called the 'Saora Familia,' a little north of the last-named mine, and at an elevation of about 3000 feet above the sea. It has a vein of gold quartz similar to the Trinidad, but is worked on a very small scale.

"Gold deposits are also said to be on the Atlantic slope, in the Indian country, but their existence is very uncertain."

Mr. Stevens would not advise Californians to go to Costa Rica to look for paying gold mines. Everything is quiet politically, the first election in the country having passed off in an orderly manner last November.

Mr. Stevens says a number of new railroads are about to be built in the State of Tehuantepec by English capitalists, and then a large amount of fine land suitable for coffee plantations will be opened up. In Costa Rica such land is held at \$200 per acre, while in that part of Mexico it can be bought for \$15 per acre, and the climate is about the same.

Banking.

[Written by a member of the "Q" Chataqua Circle, San Francisco.]

The Jews in the ancient Italian towns were in the habit of sitting in the market-places and there loaning money to those who might wish to borrow. They would sit on benches, the Italian for which word is "banco," and hence comes the word bank. Shakespeare evidently gets his character of Shylock from this custom.

Banks are established to afford a safe place of deposit for the money of individuals, corporations and governments, to facilitate the transfer of money from one person or party to another, and for the granting of aid by the loaning of money.

The Bank of Venice, founded in 1171, was the first institution of its kind in Europe, and owed its existence to the Crusades and the necessity of the Government obtaining money to conduct these wars. Various other banks were started from time to time in different cities of Europe. Finally the Bank of England was established in 1694, during the reign of William and Mary. To the war with France and the extreme difficulty experienced by the Government in obtaining money, is this monopoly due. Like the Bank of Venice, it owes its existence to the wants of Government, which gave it life. The idea first originated with William Patterson, a merchant of London, who readily saw that a Government which had been paying from 20 to 40 per cent per annum would without much hesitation grant exclusive and almost unlimited privileges to any institution which would furnish a fixed and permanent loan at a reasonable rate of interest. The plan being brought to the notice of the King, was immediately approved, and the bank was incorporated under the title of "The Governor and Company of the Bank of England," with a capital of £1,200,000. This bank granted the Government loans of 8 per cent per annum.

All the first banks were established to obtain money for the Governments, for their wars and other expenses.

In the year 1791, when the United States Government was in rather bad straits as concerning money matters, the question arose as to whether money should be raised for Government expenses by increased taxation or by loans made through a bank which Congress was then contemplating establishing. Through Alexander Hamilton's efforts, the latter plan was adopted and the "Bank of the United States" was founded with a capital of \$10,000,000, of which the United States was to subscribe \$2,000,000. Its charter was to run for 20 years. Hamilton had observed that national banks had been successful in Italy, Germany, Holland and France, and the Bank of England was to all our countrymen the synonym of financial stability, and he felt sure his plan would succeed. His hopes were not unfounded, for it aided the Government very materially in securing the needed money. In 1811 its charter expired, but it would most certainly have been renewed by Congress but for the fact that the bank had fallen into private hands, and it was feared it would become a monopoly.

Two kinds of banks come to notice in more recent years—first, the Savings Banks. These banks receive from depositors money for safe-keeping, and also allow a small rate of interest on such money; but their functions are different from the second class, namely, the Commercial Banks, which seldom if ever allow interest on deposits. The Commercial Banks will chiefly be spoken of in this article. They may be divided under two heads—the National Banks, established under United States laws, and the State Banks, incorporated under State laws. The latter are examined at least once each year by State Bank Commissioners, who may examine the condition of the bank at any time unexpected to the officers of the institution. The National Bank is very similar to this, except that it is examined by United States Commissioners sent from Washington. The object of these commissions is, by examination into the condition of the bank, to ascertain if the management is careful as to the kinds of securities it receives on loans. The National Bank when being established is compelled to have a certain number of United States bonds, either \$50,000 or \$100,000 worth, as the case may be according to its capital. These bonds it deposits with the Controller of Currency at Washington, who in return gives the bank National Bank notes to the extent of 90 per cent of its deposit of bonds. These notes the bank may loan out with the exception of 25 per cent, which must be kept as a reserve fund to redeem any notes which may be returned to it. Some bankers claim that there is an advantage in the National Bank over the ordinary commercial bank as regards profits, as they get profits on their money twice, namely, 4 per cent on the bonds which they deposit at Washington, and 6 or 7 per cent on the notes which they receive in exchange for these bonds. But all bankers do not feel that these advantages compensate for certain restrictions which are put upon National Banks. This is why all banks do not incorporate under national laws.

The first thing necessary in establishing a banking business is to secure the capital, which serves as a partial guarantee to depositors that their money will be kept in safety. Then comes the election of officers and directors, if the business be a corporation. Its officers are known and reputable men interested in other enterprises, with the welfare of the community at heart, who seek their own in others' prosperity, and whose aim is to keep their bank a safe and sound institution, yielding a fair rate of interest on honest transactions.

The bank runs its affairs like clock-work, opens and closes at regular hours, uses everybody alike, and treats all business as confidential.

Mr. Walker is a customer of the bank. He

is engaged in the commission business, which is very active, and consequently he has an active bank account. He is honest and frank in his dealings with his banker. He deposits his money in the bank to keep it safe and to have it convenient to check against for funds as needed. He deposits his checks, drafts and notes, as the bank is better prepared to collect them. He gets his exchange at the bank, because it is the most convenient method of remitting money from one point to another, and the bank is at all times prepared to furnish him such exchange at lowest rates. He borrows money from his bank, because he is there known best, and the bank is always ready to give its customers preference in making loans, both as regards rate and amount. He goes to his banker for recommendations, for information, for assistance and for advice. He expects fair treatment from the officers and courteous attention from the clerks, and wants his transactions with the bank made known to no one outside.

When leaving his signature at the bank, he

National Bank of Boston or to whoever may be his correspondent there, with the instructions that upon payment of the amount of the invoice by Brown, Craig & Co., the shipping receipt he delivered to them. Why does Mr. Walker employ his banker in this case? Because he knows that his banker has responsible agents in Boston, who will collect the money from Brown, Craig & Co. before delivering the shipping receipt to them, and they have no control over the goods until they possess this receipt. What becomes of the money paid to the Boston bank? As soon as they receive it they telegraph to the San Francisco banker, using their cipher code. The message reads like this: "Engine Walker lag steam hope Pleides." The San Francisco banker examines his code and finds that this means: "Draft of Walker on Brown \$3000 for shipment of beans, paid." Then Mr. Walker's account is credited on the books of the San Francisco bank and the First National Bank of Boston is charged with the amount.

Mr. Walker has received goods from Mann,

Wild Rye Grasses.

Since the perennial rye grass which came to us by way of Australia (and thus earned the name Australian rye grass) has become so popular in some parts of California, there has been frequent mention of the wild rye grass which seems to be wild in this State, and there has been some confusion in the local mind as to the different genera which popularly go under the name rye grasses. The grass which is usually meant by the term rye grass in this State is *Lolium perenne*, and there is another species which is more or less conspicuous as the cheat of the wheat-fields of some parts of the State, which is *Lolium temulentum*. The resemblance between these two is close enough to enable a careless observer to class them together.

There is another genus the species of which are also called rye grasses, and that is the genus *Elymus*, of which two American species are figured on this page. These are both shorter

but it is a more slender grass in all its parts, varying from smooth to pubescent. The spike is three to four inches long, cylindrical, and inclined to droop. The glumes are more slender than *E. Virginicus*, with longer awns. The spikelets are usually two flowered, the empty glumes narrow, rigid, and about one inch long. The body or dilated part of the flowering glume is oblong, about four lines long, and tipped with a slender awn an inch or more in length. This species grows in rocky woods and on river banks, and it is said by some to furnish a good hay.

REDUCED FREIGHT ON ORE.—B. Campbell, general freight agent of the Union Pacific, after consultation with mine-owners in the Coeur d'Alene mines as to the freight rates necessary to secure a liberal movement of ores, has fixed rates as follows: On crude ore, carrying less than 40 per cent of lead, to Missouri river points, \$12; to San Francisco, \$10 50. Ores carrying 50 per cent of lead and over, to Mis-

TWO WILD RYE GRASSES—*Elymus Virginicus* and *Striatus*.

is supposed to write his name with the same natural and careless ease as he would at his own desk, and he should endeavor to write it the same at all times. Thus his signature will become as characteristic and recognizable as his face, and the possibility of successful forging is much lessened.

Mr. Walker receives a shipment of wheat, to pay for which he has not sufficient funds. He goes to his banker and states the case to him. The banker examines the quotations in the daily paper and finds that wheat is selling at \$1.40 per bushel; so he tells Mr. W. that he can loan him \$1.20 per bushel provided he has the warehouse receipts. Mr. Walker then places the wheat in some responsible warehouse, and taking the receipts to his banker, has the amount of the loan placed to the credit of his account at the bank, so that he may check against it the same as against any deposit he may have made from time to time.

Mr. Walker is in the habit of shipping beans to Brown, Craig & Co. of Boston, and wishes to collect the amount due him on shipments made to them. He prepares the invoice, which is merely a statement of the goods sent, and also the shipping receipt, which is a receipt from the railroad company that they have received certain goods marked B. C. & Co., which are to be forwarded to Boston. These papers he takes to his banker, who forwards them to the First

Bell & Co., New York, and wishes to send them the amount due for such goods. He goes to his banker and buys New York exchange, which is an order of the San Francisco banker on the Mercantile Bank of New York to pay Mann, Bell & Co. a certain sum of money. This order Mr. Walker mails to Mann, Bell & Co. They indorse it on the back, thus acknowledging the receipt of the money, and present it at the Mercantile Bank and receive payment.

These transactions of Mr. Walker include the principal operations of a bank. Of course there are other details of business which the banker performs, such as the buying and selling of stocks for clients and the issuing of letters of credit on the principal cities of the world; but these are minor affairs compared with the loaning of money, the buying and selling of exchange and the making of collections.

THE NAPA CONSOLIDATED.—B. M. Newcomb, superintendent of the Napa Consolidated Quicksilver mine, makes the following statement, showing the production of and shipments from the mine during the year 1889: January, 385 flasks; February, 400; March, 380; April, 320; May, 445; June, 415; July, 340; August, 450; September, 360; October, 385; November, 380; December, 330; total, 4590.—*Napa Register*, Jan. 2d.

in the head, more bearded and otherwise different from the species which is most abundant in this State, and is called "giant rye grass" (*Elymus condensatus*), but they all are different enough from our species of *Lolium* to enable one easily to pronounce them distinct from the more valuable kinds.

The species which are shown by the reproduction of engravings from Dr. Vasey's reports are first, *Elymus Virginicus*, a coarse perennial grass, growing on alluvial river banks, or in rich low grounds. The culm is rather stout, two to three feet high, leafy; the lower leaves are 10 to 15 inches long, broad and rough. The sheath of the upper leaf usually incloses the stalk and sometimes the base of the flower spike. This spike is erect, dense and rigid, two to four or five inches long and one-half inch thick. The spikelets are two or three together at each joint, all alike and fertile, sessile, two to five flowered, and each with a pair of empty glumes. These glumes are very thick and coarse, strongly nerved, lanceolate, and bristle-pointed, about one inch long. Prof. Killebrew of Tennessee says it is very valuable and ought to be tried in cultivation.

The other species is *Elymus striatus*—"Smaller Wild Rye grass." This grass has a structure as to the flower-spike similar to the preceding,

sonri river points, \$16; to San Francisco, \$12.50. But little ore has been shipped from Coeur d'Alene of late owing to the high rates charged by the Northern Pacific. It is supposed that this reduction of from \$5 to \$10 a ton will cause a greatly increased output, and that the shipments will be 150 tons a day and more after awhile.

COMSTOCK BULLION.—The December bullion yield of Comstock mines aggregates in round numbers about \$620,000, divided as follows: Con. Cal. and Virginia, \$300,000; Savage, \$45,000; Alta, \$30,000; Hale and Norcross, \$100,000; Justice, \$25,000; Yellow Jacket, \$40,000; Crown Point, \$55,000; Occidental, \$15,000; and Overman, \$10,000.

STEAMERS' RECORDS.—The Peninsular & Oriental Steam Navigation Co. owns a fleet of 72 steamships of 190,270 tons and 189,000-horse power. Last year the fleet steamed 2,500,000 miles, "without accident or delay." There is a record worth talking about.

THE TIDES ON THE ISTHMI.—At Aspinwall on the Atlantic side of the Isthmus of Panama the rise of the tide is only 1½ feet, but at Panama on the Pacific side there is at times a difference of 21 feet between high and low water.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—*Ledger*, Jan. 4: The ten-stamp mill resumed operations last Tuesday, and a steady run for a considerable time is anticipated. The ore is being taken from an open cut 60 feet long and 30 feet wide. Everything is put through the mill. The formation is broken up, as a well-defined ledge could not reasonably be looked for at such a depth. We are told by the superintendent that the rock sent to the mill averages between \$4 and \$5 per ton. At this rate, when fixed up to work economically and on a large scale, the mine ought to pay handsomely. There is a shaft on the property which, however, is only 60 feet deep, and it is not being worked at present. Seven men are employed—five in the mine and two at the mill. The property has been listed on the stock board in New York. At the present ten-stamp mill they have only 90 feet fall, consequently the cost of water-power is a material item. It is proposed to increase the milling capacity to 20 stamps, and to bring water direct from the Amador canal through an 11-inch pipe. This will necessitate a pipe-line 7000 feet long. The survey for this line was made this week, and we are told the work will be pressed forward to completion as speedily as possible. Altogether the cost of the contemplated improvements is estimated at \$20,000. The claim embraces 1700 linear feet by 450 in width. Some rich pockets were met with near the surface.

ANADOR GOLD MINE.—At this mine there are about 80 men employed. The owners in London are clamoring for the completion of the mill. They of course do not realize the condition of the roads, and therefore cannot understand why the mill remains at a standstill so long. It is an utter impossibility to get any teamster to undertake the hauling of the rock-crusher and other heavy material while the roads are so bad. Indeed, the outlook is not favorable for getting this machinery on the ground until the winter is over.

MISCELLANEOUS.—Most of the mines are greatly troubled from the increase of water necessitating the running of the pumps a considerable portion of the time. At the Zeile the lower level is flooded. This, however, does not cause much difficulty, but if the flow of water continues, it will be hard to keep the mill going and at the same time prevent the water from flooding other levels. A 15-inch pipe 1500 feet long has been laid from the Kennedy reservoir to the mill, which will hereafter be operated by water-power.

Butte.

GOLD AND COPPER.—*Oroville Register*, Jan. 6: From the Stow mine, Forbestown, 3000 pounds of pure copper have been extracted and shipped below during the past few weeks. The copper is pronounced by experts to be equal to any in the world. The Stow and Golden Queen mines at Forbestown are panning out in a surprising manner. Since the erection of the latest improved chlorination works, there, \$1000 a month is being saved that has heretofore been lost in the refuse. The rock is very high grade in gold, and the sulphurets are exceedingly rich. Other improvements in gold-saving machinery are being put in, and the rock is expected to average \$250 a ton.

El Dorado.

STOPPED WORK.—*Placerville Observer*, Jan. 6: The present stage of bad weather has stopped work on the Taylor mine, near Garden Valley. The new company taking hold of the mine will rebuild the surface works, putting in new hoisting works and 20 stamps, with room for 20 more. Things will be lively on this mine as soon as the weather permits of surface workings.

HENRY'S DIGGINGS.—Water will be abundant next summer for mining. L. L. Alexander has stopped work at the Crystal mine, but is still at the mine. John McLane and J. Ryan are still at work in the Oak mine, with good prospects ahead. William Armstrong has out a big pile of gravel, taken from the Old Stand-By at Henry's Diggings. The Carrie Hale mine is lying idle for the want of an owner and miner.

Fresno.

HILDRETH.—*Cor. Fresno Expositor*, Jan. 12: Things were lively for awhile around the old Hildreth mine, pioneer of the district, named after the late illustrious Tom Hildreth, from whom, by the way, the town also derives its name. This mine has had rather a checkered career, proving at times the joy and sorrow of its many owners, but owing to bad management and other adverse circumstances it has never paid any large dividends. Some very remarkably rich strikes have been made there, however, and the present owner, Wm. Dunphy of San Francisco, is well aware of the fact that it only needs to be properly handled to prove a paying proposition. T. P. Peck and Geo. Hildreth, Mr. Dunphy's right hands, were with us recently looking after assessment work and getting everything into shape for future operations. Mr. Peck was well pleased with the outlook and told us he hoped to see a general resumption of work on the mine early next spring. Responsible parties are negotiating for a lease of the Abbey which proved so long the mainstay of the town, and although the final papers have not yet been drawn up we understand that no serious hitch lies in the way of a satisfactory agreement between the interested parties. The syndicate operating at the Zoller mine is from latest accounts making good headway, getting out plenty of ore and finding a better prospect the more they proceed with development work. The rough weather, however, is giving them some trouble with the crushing of rock and has likewise seriously retarded business at Zebra. Here we understand it has necessitated a total suspension of work, which it is to be hoped will prove only temporary.

Inyo.

GOOD MINING REGION.—*Inyo Independent*, Jan. 6: Mr. G. A. Smith, a real estate dealer and mining speculator of Los Angeles, made a trip recently through the Darwin and Panamint country and got back to Independence at the beginning of this week. He says that over a wide region of country he saw many mining claims that he is confident would pay good profit if rail transportation could be had for

the ore. Immense quantities of ore are in sight that is too low grade to pay for hauling 70 or 80 miles by wagon as must now be done to get it to a railroad. But if the railroad were within easy reach all of this ore would be taken out, affording employment for many men and much capital. Mr. Smith bonded an antimony mine from Mr. Hannigan situated on the Death Valley side of the Panamint mountains. Mr. Smith says this is a large deposit of antimony, and he has no doubt the mine will be a valuable property if worked. He was induced to go into that country in the hope of the speedy extension of the railroad from Salt Lake to Los Angeles, but until this extension shall be made the property has no value. He felt discouraged by recent reports that the road would not be extended beyond Pioche and said that his firm would not now expend any money in opening the mine.

THE ALEXANDER MINE.—Scott Broder and his partner, Acunha, are working the Alexander mine in Wauchoa. Several years ago John Alexander took out the first ore from this mine; it was found close to the surface, and was very easily mined. The second-class quality of the ore gave 17 ounces silver per ton and 44 per cent lead. At the prices then paid for silver and lead, the ore was worth \$55 per ton. The rest of the ore gave 24 ounces silver per ton and 56 per cent lead. This ore was then worth about \$68 per ton. The cost of getting out the ore to the railroad was so great that Mr. Alexander made but one shipment of 11 tons and then quit work upon the mine. For packing 1 1/4 miles to where the ore could be reached with wagons the charge was \$3 per ton. He had also to provide water for the pack animals at an additional cost of \$5 per barrel, or nearly \$2 for water against each ton of ore. The cost of hauling by wagons to the railroad was \$4 per ton. Then railroad freight and cost of working added to the other expense left nothing for the miner. Now the ore can be got out and worked at far less expense than before, and the prospect is good that a fair margin of profit will be left for the miners. The mine is but little over 13 miles distant from Alford, on the C. & C. railroad.

CERRO GORDO.—The combination shaft at Cerro Gordo is retimbered down to the Omega tunnel, a depth of 300 feet. To the next tunnel below, the distance is between 300 and 400 feet, and the work of timbering down to that point is being pushed as rapidly as possible.

ORE.—In doing assessment work in the Beauregard mine at Cerro Gordo, Jack Dunphy has struck some fine ore. The extent of the body cannot yet be determined, but it looks as if there might be a good deal of it. Dunphy recently purchased a controlling interest in the property.

ANTIMONY.—Joe Danielson, John Curran and William Hannigan have bonded antimony mines in Wild Rose mining district to G. A. Smith of Los Angeles for \$3000. Mr. Smith intends to develop the property, and if satisfied with the result, will build reduction works near the mines.

FOUND GOLD.—*Inyo Index*, Jan. 1: In his search for lead ore in the old Uncle Abe mine, Mazurka Canyon, Phil. Cartier struck a fair-sized ledge of gold ore that promises to become a good mine. Several specimens sent to town are rich in free gold, and the quartz is of excellent character.

CHLORIDING.—Ben Laskey tells us that there are now 14 men chloriding at the Keynot mine in Beverage district. A bunch of very rich ore was struck the other day, the extent of which is not yet known.

LOOKOUT.—*Register*, Jan. 2: Through a private note from Lookout district, we learn that Supt. Frank Fitzgerald of the Modoc Consolidated is working nine men at \$3.50 per diem, five at \$3.14, and two at \$4.50 per month and board. Since November 18th, he has been concentrating and jiggling the old dumps. The result of the first two carloads shipped was as follows: Concentrations from rocker, 70 ozs. silver, 31 per cent lead. Concentrations from jigger, 166.6 ozs. silver, 54 per cent lead, and gold at the rate of \$7.02 per ton. These dumps will last nine months or more, and will furnish steady employment for 20 or more men during that time.

Kern.

METALLIC ANTIMONY.—*Kern County Californian*, Jan. 4: A. Blanc, a gentleman from Oakland, who has been having some mines prospected on Erskine creek, discovered a curious-looking ore which he took to San Francisco for determination. It puzzled almost all the experts until by analysis it proved to be native antimony and almost chemically pure. The occurrence of metallic antimony in a native state is only once before known. In a scientific paper published over a hundred years ago, mention is made of the discovery at Auvergne, France, of a small deposit of pure antimony. The metal is fine-grained, with steely fracture, and has puzzled all the metallurgists. It is not expected that much will be found, but from its rarity to find any at all may be considered a metallurgical event.

Lake.

SILVER MINES.—*Clear Lake Press*, Jan. 3: Last week we had the pleasure of examining some of the ore from the newly discovered silver mines across the lake mentioned in a former article. The owners were confident that they had struck a bonanza and were shipping some of their ore to the city to have it worked, a much more satisfactory way of determining its value than an assay made from choice pieces of ore. The general character of the rock seems to be a decomposed quartz carrying a heavy percent of chlorides of silver; there is also quite a sprinkling of gray quartz in which native silver can be very easily traced. Many croppings are found in that neighborhood.

Mariposa.

PLACERS.—*Cor. Mariposa News*, Jan. 4: Placer mining is now generally conceded to be a dead industry, a relic of '49, and the special object of adverse legislation. Mariposa placers and gravel claims, rich and numerous as they were in early days, have hardly been worked. The surface mines were exploited in primitive ways and deep diggings left undisturbed. Claims that did not yield \$5 or \$10 per diem were considered unproductive and were abandoned. A subsequent series of dry winters, scarcity of water due mostly to the improvidence of early settlers in not securing water rights, were the main facts of placer mining being discontinued, while the excitement that followed the discovery of quartz mines diverted the attention to other channels. Enormously rich banks of gravel still exist in our county, and the present wet winter will give the "gambusino" a show to prove it. At

Phillip's Flat there is one of the richest gravel banks in the State. It is the old river channel running in streaks parallel with the present course of the stream and pays all the way from five cents to \$25 per pan. This is not exaggeration, for there are men in our vicinity who have worked these and whom scarcity of water drove to more remunerative employment. Hundreds of thousands of dollars were taken out in early days. The flat originally held 40 or 50 acres; of these some 10 or 12 only remain on the upper part, and it has always been considered the richest, and is still left undisturbed, mostly on account of a high bank of cement that had to be blasted. In 1880-81, the owners, Messrs. M. Bauer and T. Branson, did a great deal of dead-work and ran a tunnel from the river to the old channel, blasting every foot of the way. Lack of water has since prevented further operations, but now things have somewhat changed. With a 40-foot fall, a 2-foot hose with a 2-inch nozzle, they are at work, and as the stream strikes the bank, earth, gravel and boulders come tumbling down at a lively rate, and find their way to the river through a long string of sluice-boxes, leaving the shining gold on the bottom. Although Mr. Branson says that he calculates the season's returns will go from \$10,000 to \$15,000, experienced miners think he will fall short of the mark. Were we to have the water facilities other counties are blessed with, we would not feel the weight of the Mariposa Grant banging on our necks, and would pull through anyhow.

CHINESE ON THE GRANT.—*Mariposa News*, Dec. 28: A communication appeared in the last issue of the MINING AND SCIENTIFIC PRESS, in which the correspondent says that Chinese are exclusively employed on the Grant, in the mine at Bear valley. This is a mistake. At times it is found necessary to employ a few Chinese there doing work that white men will not like to do, and then only for a few days.

Napa.

THE NAPA CONSOLIDATED.—*Register*, Jan. 3: B. M. Newcomb, superintendent of the Napa Consolidated Quicksilver mine, favors us with the following statement showing the production of and shipments from the mine during the year 1889: January, 385 flasks; February, 400; March, 380; April, 320; May, 445; June, 415; July, 340; August, 450; September, 360; October, 385; November, 380; December, 330; total, 4550 flasks.

THE KNOXVILLE MINE.—James Raphael, foreman of the Knoxville mine, says the roads between here and Knoxville are in a terrible condition, but he managed to get through on horseback. Of the mine he says it is closed down for the present. There is an abundance of ore, but because of bad roads they can neither get anything in nor out. The new engine shaft is running night and day. It is now at a depth of 160 feet. When a depth 40 feet lower is reached a station will be established and a crosscut will be made into the ledge. With passable roads again the mine will be running in full blast.

QUICKSILVER SHIPMENTS.—*Calistogan*, Jan. 1: There were shipped from Calistoga during the month of December, flasks of quicksilver produced at the mines as follows: Bradford, 183; Napa Con., 275; Gt. Western, 116; Sulphur Bank, 159. Total flasks, 733. Exclusive of the above there were 25 flasks received yesterday from the Bradford mine, but as they were not shipped from Calistoga until after the close of December, they will be included in January shipments.

Nevada.

MINING DRAWBACKS.—*Grass Valley Union*, Jan. 7: The storms of rain and snow which have so persistently prevailed this winter have not seriously interfered with quartz mining in this district up to the present time, although the pumps have been required to do extra duty in keeping the water in the mines under control, and since the heavy snowstorms have come there has been a constant apprehension of snowslides along the line of the ditches that supply water-power for the mines and mills. Such accidents have not yet occurred, and the amount of water carried in the large ditches may prevent them freezing up, but with the temperature getting down to within a few degrees of zero, that misfortune may occur at any time. The cold weather of yesterday interfered with milling, as the quicksilver plates on the aprons would not take up the gold readily, and there may be a temporary shutting down of the mills until the weather becomes more mild.

FROZEN UP.—*Tidings*, Jan. 6: The snow and frigid temperature has resulted in difficulties at the mills and mines. The Pittsburgh's supply ditch is frozen, and the steam plant is being utilized for hoisting and pumping. The Idaho mill is froze up, and operations have been suspended until the weather moderates. At the mine, however, operations are proceeding full blast. The pump-rod at the Empire broke Saturday night, and that at the North Star Sunday night, necessitating delays of several hours. As is the case at the other mines of the district, water is at present giving no little trouble and anxiety, the pump at the North Star being run at double the usual speed. Four feet of snow at Bloomfield and six feet at the Derby. The Derby mine has been shut down temporarily, because the ditches are frozen and water for the boilers cannot be had. A prolonged cold snap and the formation of ice in the South Yuba canal, from which water for power is derived by Grass Valley's principal mines, is feared. The ditch crew have been reinforced, we understand, and no expense will be spared to keep the canal open.

THE PEABODY.—*Transcript*, Jan. 3: The work of pumping out the Peabody mine at Grass Valley was completed this week, and Supt. Tilley now has his men at work enlarging the shaft. Sinking will be commenced as soon as the work of enlarging is completed.

Placer.

FOREST HILL DIVIDE.—*Placer Herald*, Jan. 6: Mining as it has been for years still claims the attention of most of the people, and probably will until the gravel beds are worked out. No startling developments have been made during the year, although much labor has been expended. The Gray Eagle Co., early in the spring, succeeded in sinking a shaft 350 feet in depth to good gravel. They then turned their attention to running a tunnel that should tap the channel and drain it. The tunnel is now over 500 feet in length. The rock is a soft black slate, and consequently admits of rapid progress. Anthony Clark has started another tunnel farther up Owl Creek to tap the Wolverine, a claim

adjoining the Gray Eagle. There has been but little mining either at Todds Valley or Yankee Jims during the year. Some work has been done on the Red Sea at the latter place, and C. Trafton has uow a tunnel about 800 feet in length in his Georgia Hill claim. At Forest Hill there is but little mining going on except at the Mayflower. Work on a large scale was suspended last spring at the Dardanelles. Several men are at work there now. The Baker Divide Co. is drifting, and would, if all their upraises and drifts had been put into the main tunnel, have been in between 6000 and 7000 feet. The Mayflower gives employment to the usual force, and shows no abatement in its output of dust. The mill has been running almost steadily since it was started on Dec. 11, 1888. Twenty stamps have been in operation the greater part of the time. The yield in gold for the year ending Dec. 11, 1889, was \$330,000, and for the month of November, the mine paid \$34,000. For the last six months the principal part of the work has been done in the north gangway. The yellow deposit with its black gold has been cut through and connection will be made shortly with the old ground which paid so immensely in 1886. The old Paragon at Bath has been heating its record for the last few months. This mine has been one of the richest in the State. It was worked in 1880 by George Webster. In 1862 A. Breece, Judson Wheeler and W. A. Freeman owned it. Mr. Freeman afterward sold out and went to Oakland with a fortune. Messrs. Breece & Wheeler have owned the mine since then, and have consolidated with it the Mint and Rough Gold. There are two channels, an upper and lower. The upper was rich, but never paid so regularly as the lower. No work has been done on this for years. The tunnel in the lower channel is now 9240 feet long. The pay dirt where work is now going on is six feet in depth and very rich. Gangways and crosscuts are being run in order to block out the ground so that a large force of men can be put to work. The channel here is 60 feet wide, and on one side yields \$60 to the carload or ton of gravel. Mr. Breece has taken out as high as \$3000 to the pan in this claim, and in one crevice last winter he took out \$15,000. It is a remarkable mine, and there appears to be no end to its richness. It has always paid big dividends from the time it was opened. According to latest reports no mining has been done at Michigan Bluff since last winter. W. Muir is operating at the Oro near the Weske, and is taking out some gold. The Hidden Treasure tunnel is now 3300 feet in length and in rich ground. Some idea of the amount of work that is done in this mine may be gained from the statement that 200,000 laggings and 40,000 caps and posts are used yearly in the tunnel, drifts and crosscuts.

San Diego.

ANOTHER GOOD STRIKE.—*Julian Sentinel*, Jan. 1: Last week another new strike was made in Banner. This time it was in new ground, and by three deserving lads who have been wont to swing a hammer and shove a drill in this camp. The boys are miners from way back, and know a good thing when they see it. The ledge is well-defined, about eight inches in width, and will mill \$60 per ton on the surface. This strike is proof of what we have always contended that this camp is not half prospected yet.

PINE VALLEY.—*San Diegoan*, Jan. 2: The Hawkes Brothers and others, who are in from the Pine Valley mining section, are much elated over the prospects in that locality. To-day they interested a number of miners by showing specimens of rich quartz from claims which they have, situated about half-way between Noble's camp in Pine Valley and the Stonewall mine at Julian. "In 30 years' experience," said one, "I don't think I ever saw so many acres of rich rock in any one place—ore that runs \$100 to \$500 and up to \$1000 to the ton. Take a piece of quartz in almost any place, the size of your thumb, and you can get upward of a hundred colors from it. Within a radius of a mile and a quarter from our camp there are not less than 30 claims, any one of which is as good as the average run in the Alamo, and with the added advantage that it is all under the American flag." Governor Waterman's son, who is in charge of the famous Stonewall mine, was over in Pine Valley the other day to satisfy himself as to the truth of the reported rich finds there. According to the statement of one of the prospectors now in the city, the Governor's son was astonished at what he saw, and he predicted a very prosperous camp when developments are well under way. The Pine Valley section is quite cool during the winter—snow not infrequently falling there. This season, however, the weather has been very mild, in fact there is seldom a month in the year that mining cannot be carried on. The average climate is delightful; there is an abundance of wood and water, and from all accounts the field is a most inviting one to industrious miners. Pine Valley is bound to come to the front.

Shasta.

SQUAW CREEK.—*Cor. Redding Free Press*, Jan. 4: The Uncle Sam mine is running with a full force, there being about 60 men employed. Several of the laborers have moved their families in here and they expect to have a school in the near future. L. J. Fader is running three four-horse freight wagons into the Squaw Creek mines; also a daily stage.

DRY PROCESS.—The large new mill of the Calumet company, for working gold ores by Paul's new dry process, is now completed and will commence running the coming week. This is the second mill the company has built in the past year for the same process.

Siskiyou.

SOUTH FORK OF SCOTT RIVER.—*Cor. Yreka Journal*, Jan. 8: All of the mines on the South Fork are in active operation although considerable snow has fallen. Those who had their mines well opened before the winter snows set in have no trouble in working their claims. The claim sold by Alex Parker to a Chinese company, for the mod-st little sum of \$50,000, is turning out several thousand dollars monthly, and is considered by all miners here to be one of the best mining properties in Northern California. The old Fosch claim opposite the town of French Flat is also owned by a Chinese company, and the receipts of this claim amount to \$300 and \$400 weekly, in fact the Chinese own the South Fork for a distance of four miles, with the exception of a few hill drifting claims, just above the town, which have been steadily worked for a number of years. Boulder creek, Fox creek and Jackson creek, tributaries of the South Fork, are owned and worked by white men. The snow on these creeks is five

and six feet in depth and still piling up, but most all the claims are drift diggings where the rich auriferous dust is brought to the surface through tunnels preparatory for spring washings. A number of men are wintering here from the North Fork of Coffee creek, Trinity county, where they have good claims, to which they will return as soon as the winter storms are over.

NEVADA.

Washoe District.

BEST AND BELCHER.—Virginia *Enterprise*, Jan. 4: On the 625 level, east crosscut No. 1 has been extended 12 feet; total, 90 feet. Formation, soft porphyry. On the 1000 level, east crosscut No. 1 has been extended 14 feet; total, 70 feet. Formation, hard porphyry. On the 1200 level, commenced repairing the station on December 29.

GOULD AND CURRY.—On the 200 level the southwest drift has been extended 18 feet; total, 268 feet. Formation, quartz, clay and porphyry. On the 400 level, in west crosscut No. 2, at a point 122 feet from the south drift, have started and advanced a southwest drift a distance of 30 feet. Formation, quartz, clay and porphyry.

SAVAGE.—On the 300 level have resumed work in the face of the main west drift from the station, and made during the week 32 feet; total length, 475 feet. From the top of upraise No. 1, from the southwest drift on the 400 level, advanced 16 feet in low-grade quartz, and connected with the north stope in the Hale and Norcross mine. This connection gives ample ventilation to prospect the ground south from the upraise. Are extracting ore from the 400, 500, 600 and 750 levels. Milled during the week 435 tons of ore. Have bullion on hand and at the mill amounting to \$29,978.48.

ALTA.—Are still sinking the winze in the ledge below the 925 level. The stopes between the 825 and 925 levels are looking well, and the mill reduces daily about 45 tons of ore.

CON. IMPERIAL.—West crosscut No. 2 from the 300 level north drift is out 71 feet, 29 feet having been added during the week; face shows quartz with occasional bunches of ore. The north raise from the same level is being repaired. West crosscut No. 1 from the 500 level drift is out 98 feet, 26 feet added during the week; face in low-grade quartz, and the main north drift itself on the 500 level is out 253 feet from the shaft; 31 feet added during the week; face in a mixture of quartz and porphyry.

CONFIDENCE AND CHALLENGE.—The Confidence-Challenge joint west crosscut from the 300 level north drift is out 120 feet, 17 feet having been added during the week; face shows quartz and porphyry.

YELLOW JACKET.—The west drift on the 500 level is out 900 feet. Crosscutting on the 900 level. Shipping to the Bunswick mill 60 tons of ore daily.

SEG. BELCHER.—During the week the west crosscut on the 1000 level was advanced 29 feet; total length, 79 feet; face in porphyry seamed with small strings of quartz.

CROWN POINT.—Have cleaned out during the week 17 feet of the old 160 level west crosscut; total length cleaned, 90 feet. Resumed work during the week in the east crosscut and advanced it 22 feet; total length of crosscut to date, 150 feet; face in quartz and porphyry. The stopes in the mine show no change since last report. Milled 456 tons of ore during the week, the average value of which was \$15.45 per ton.

BELCHER.—The east crosscut on the 850 level was advanced during the week 15 feet; total length, 44 feet; face in quartz and porphyry. The east crosscut south of shaft on the 200 level has been advanced 17 feet; total length, 45 feet; face in low-grade quartz, assaying from \$5 to \$10 per ton. The south drift on the 200 level is out 133 feet, having made 21 feet during the week; face in clay and porphyry. During the week a shaft station 158x7½ was excavated and timbered on the 600 level, and a drift started south from it.

JUSTICE.—The 822 level north drift has been advanced 6 feet during the week; total length, 127 feet. The 622 level north drift has been advanced 37 feet; total length, 541 feet; face in low-grade quartz and porphyry. Have started an upraise from the southwest drift on the 490 level, with fair prospects of finding ore; the upraise is now up 15 feet from the track floor. The stopes are looking well and are yielding the usual quantity of ore. Shipped to the mill during the week 227 tons of ore, the average value of which was \$23.87 per ton.

CHOLAR.—The north drift on the 750 level is out 760 feet; face in clay and quartz giving low assays. The north drift on the 930 level is out 309 feet; face in hard porphyry.

POTOSI.—East crosscut No. 3, 520 feet south of the line, 650 level, is out 80 feet; face in quartz and porphyry. The east crosscut 560 feet south of shaft, 930 level, is out 190 feet; face in clay and quartz.

EXCHEQUER.—The 500 level east crosscut on the north line is out 58 feet; face in quartz and porphyry.

ALPHA.—The 500 level west crosscut 100 feet north of shaft is out 383 feet; face in clay and quartz. Are cutting out for a winze station and sunk on ore found in the east crosscut 60 feet north of shaft. The north drift on the 600 level is out 75 feet; face in quartz, giving low assays.

CON. NEW YORK.—The only work done in the mine the past week has been repairs in the north drift on the 800 level.

SILVER HILL.—The 260 level east crosscut, 790 feet from shaft, advanced 15 feet through hard porphyry; distance from shaft, 800 feet. The northeast crosscut, 430 feet from shaft, advanced 15 feet through porphyry and clay, with small seams of quartz; distance from shaft, 495 feet.

EAST SIERRA NEVADA.—On the 520 level the east crosscut from the south drift was advanced 42 feet, making its total length 298 feet; face continues in porphyry, showing streaks of quartz and clay with some water.

HALE & NORCROSS.—On the 300 level the east crosscut is advanced 230 feet; face in clay, porphyry and seams of quartz. The north upraise from the 1300 level is advanced 75 feet and continues in low-grade ore. The north drift started from the top of that upraise on the 1300 level was advanced 18 feet and connected with a south drift from the 1200 level ore stope. This connection greatly improves the ventilation of this part of the mine. Are still re-timbering the main incline at and below the 1300 level station; also the main shaft above the 1200

level. Are extracting ore from the 400, 500, 600, 700 and 1200 levels, and from the 1300 level upraise. During the week have milled 120 tons of ore, the average battery assay of which was \$19.89 per ton. Have bullion on hand and at the mill amounting to \$64,757.85.

WARD COMBINATION SHAFT.—East drift on the 1800 station is out 132 feet; face in porphyry. **JULIA CON.**—The northwest drift from the 1800 Ward station is out 150 feet; face in clay and porphyry.

ANDES.—Work has been resumed in this mine. **Cherry Creek District.**

MERRIMAC.—White Pine *News*, Jan. 1: The Merrimac Co. of Cherry creek seems to be in no end of financial trouble. Its creditors at home and abroad are clamoring for their dues. A Mr. Nelson went through here a few days ago and took Deputy Sheriff Simpson with him to attach the company's property at Cherry creek. We learn that the claim is about \$6000, held by San Francisco parties.

Eureka District.

ORE AND BULLION SHIPMENTS.—Eureka *Sentinel*, Jan. 4: During the month of December, 1889, there were shipped over the Eureka & Palisade railroad the following products from the mines and furnaces of this district: Sixty tons of Richmond lead, 180 tons of crude bullion, 534 tons of ore and 13 tons of scrap iron destined for Salt Lake and San Francisco. The ore shipments were small, as none has been hauled from the mines for two weeks past.

Jefferson District.

AT WORK.—Belmont *Courier*, Jan. 1: Work on the various mining claims in Jefferson district is prosecuted as usual. The Harrison Bros. are still encountering rich ore in their mine.

Philadelphia District.

WIDENING.—Belmont *Courier*, Jan. 1: The pay streak in the Laity mine in East Belmont is widening as the work of sinking progresses. This is proving one of the best properties in the district.

Pioche District.

RAYMOND SHAFT.—Record, Jan. 1: The main work going on at the Raymond shaft of the Pioche Con. Co.'s mines of late, viz.: that of opening up the Black Ledge winze, west of the shaft on the 12th level, was brought to a rather sudden stop Wednesday about noon, the immediate cause being a settling of the hill back of the hoisting works and directly behind the air-compressor, which forced the wall of the building against the fly-wheel of the machine and made a stop necessary to avoid serious damage. The winze at the time was clear for a depth of 187 feet. Sufficient warning was given to allow the pumps and air-pipe connections to be removed from the winze. Ordinarily an accident of this character would necessitate a stoppage of work for less than 24 hours, but occurring at this particular time it is not likely that work will be resumed for several weeks on account of the difficulty experienced in getting in wood. Thirty cords a day are needed, and in such weather as we have had for several weeks past it is practically impossible to get in any at all. The reserve wood has been consumed during the bad weather until on stopping work on Wednesday a supply for eight days only remained on hand. During the 24 hours preceding the accident seven feet was gained on the water, and this rate continued for a few days would have enabled the workmen to recover the pump submerged years ago on the 14th station.

Tuscarora District.

NEVADA QUEEN.—Times-Review, Jan. 6: Joint crosscut from 600-foot level of North Belle Isle has been advanced 34 feet, cutting seams of spar and must be very close to the vein.

BELLE ISLE.—West crosscut from the south drift, 250-foot level, extended 14 feet; rock hard, showing faces of ore.

NAVAJO.—A cleanup is being made at the mill, preparatory to closing down.

NORTH COMMONWEALTH.—3d level: Joint crosscut has been extended 11 feet, showing low-grade ore. East crosscut, from south drift, has been advanced 14 feet, all in vein formation showing some mineral.

GRAND PRIZE.—Face of north crosscut on the 500-foot level advanced 15 feet through more favorable ground.

NORTH BELLE ISLE.—Owing to the unprecedented weather, concentration has been temporarily suspended.

DEL MONTE.—No. 2 west crosscut, on 1st level, has been advanced 8 feet; work has been suspended at this point for the present, the miners having been put to work driving a drift north from joint crosscut; this drift is showing good ore. Joint crosscut east on 2d level has been advanced 12 feet; the rock is hard, but breaks well. On the 3d level joint crosscut continues to show low grade.

ARIZONA.

YAVAPAI.—Arizona *Journal-Miner*, Jan. 1: Parties are examining the Alligator mine in Crook canyon, with a view of purchasing. It is one of the best gold properties in Yavapai county. Ten bars of gold bullion from the Crowned King mine were shipped out by express yesterday. Street rumor has it that Phelps, Dodge & Co. have ordered a mill to arrive soon, to work the ore from the Senator mine. A deed has been filed for record from Dan O'Boyle and O. S. Morse to Wm. Smith, Jr., for six mines in Quartz mountain district. One-half interest in the Shannon mine, Humboldt district, has been sold to Peter Arnold for \$500. John Proutt has returned to Prescott, and will take charge as foreman of the Senator. The marble quarry near Mayer, owned by Geo. B. McCann and Joseph Mayer, has attracted considerable attention, and the prospects are good now for getting machinery to cut and polish the marble. Seven mills are engaged in crushing ore now in this county, and two smelters are also in full blast, with a prospect for the number being increased in the spring.

BRITISH COLUMBIA.

SMALLER CAMPS.—Kamloops *Sentinel*, Jan. 2: There are several mining camps throughout the interior which are not sufficiently developed to require an extended notice. At Cherry creek the Hidden Treasure Co. have accomplished nothing during the year. The McIntyre and Vernon claim has had some development work done, and a quartz-mill has been taken in this season and preparations made

ready for work next spring. The ore looks well, and everything is encouraging. At the Rock creek camp both hydraulic and quartz machinery have been taken in and considerable work has been done. At the Okanagan, much prospecting has been done, and one claim has been bonded to an American company for \$55,000. Great expectations are held out for next season. On Shuswap lake several good locations have been made, from which samples of ore have been taken assaying very high. Owing to lack of capital the claims are not thoroughly developed. The Allingham claim on the North Thompson has been further developed this season, a shaft being sunk 45 feet. The prospects are good for a paying mine. Other claims have been located in the vicinity of Mr. Allingham's. At Jamieson creek two locations have been made by Munn & Co., from the Toad mountain district. The prospects are very favorable and the claims will be further developed in the spring. One man is working in the claim during the winter. Some development work has been done this season on the coal seams near Kamloops. Not sufficient has been accomplished, however, to say whether the find will pay to work. Nothing has been done on the coal find on the North Thompson. On Siwash creek, near Vernon, considerable excitement was occasioned during the summer on account of the diggings found there. About 150 claims were recorded, and the creek was fairly well worked with varying results. There are three or four claims working all winter. Some of the claims paid \$3 a day per man, but this was exceptional, and it is said the camp did not pan out as well as was anticipated.

COLORADO.

IMPORTANT DEVELOPMENT.—Aspen *Times*, Jan. 2: Reports that come from the Mineral Farm are to the effect that the recently-discovered ore body continues to improve in appearance, and the management now feel convinced that they have a pay mine. It is not our purpose to discuss here the character of the developments, but simply to point out the important bearing that the opening of a bonanza mine at that point will have upon the future prosperity of Aspen. The discovery, if it proves to be a really good one, will be important for two reasons. The mine is at a point much farther north on the belt than any other pay mine and the discovery will prove the value of several thousand feet of the lode. While this may be a source of congratulation, there is another feature that will be of even more value to the district. The developments in the Mineral Farm have been upon an extended and expensive scale. It has not been one of those properties in which rich results have been attained with comparatively little exploration. Large sums of money have been expended and repeated disappointments have been met with, but the gentlemen who have been pushing the enterprise have never hesitated, and at last success appears to have been attained. We have always held that there was no section of 1500 feet of this contact that would not prove up rich if thoroughly prospected. Their success is a great card for Aspen, and the Mineral Farm can be pointed to as a signal illustration of the proof of the claim that it will pay to develop any property on the belt no matter what expense may be required to prove it up. It proves that this camp is not one of those where there is one small section rich, with miles of barren extension. It proves that the rich ore chutes lie along the lode at pretty regular intervals and that future exploration will continue to disclose their treasures until the developed series shall extend all the way to some point near Ashcroft on the south and perhaps to the boundary of the county on the north.

MINERAL OUTPUT.—Idaho Springs *News*, Jan. 2: The value of Colorado's mineral output for the year 1889 is estimated at \$30,000,000. During the month of December there were shipped from the station at this place 131 cars containing 3,684,000 pounds of ore, an excess of 979,450 pounds over the shipments for November. During the year 1889 Clear creek county shipped to the Omaha and Grant smelter 13,662 tons of ore carrying 3,732,178 pounds of lead, 1,091,203 ounces of silver, 12,436.73 ounces of gold valued at \$1,414,638.76. The ore shipped from this county to the above smelter had more value than that shipped by any other county in the State. The Champion mine during nine months ending Dec. 31, 1889, produced smelting ore and concentrates to the value of \$73,784.28. The ore is low grade, and it required a large quantity carefully and skillfully treated, to produce the above amount.

CRESTED BUTTE.—Elk Mountain *Pilot*, Jan. 2: We have been in the habit at the end of every year of publishing a detailed statement of the mineral output for the year, but the output is so painfully small the past year from the silver mines that we have very little to state. This state of affairs is no fault of the mines—no mines have played out, because they have not been worked to get played out. Such mines as the Sylvanite, Augusta, Daisy and the Ruby Chief group, which have always been depended upon to make an output, failed to ship anything at all. There was only about 300 tons shipped, the most of which comes from the Forest Queen and the Black Queen mines. We are promised better things for the coming year.

DAKOTA.

SEMI-MONTHLY CLEANUP.—Deadwood *Pioneer*, Jan. 3: Bullion from the Caledonia, Homestake and associated mines, representing cleanup for the last half of December, was brought down yesterday and deposited in Wells-Fargo's express office. It amounts to about \$170,000 and goes East to-day.

NO JUMPING YET.—No cases of mine jumping have yet been reported, but this does not necessarily argue that no mines have been jumped. Though assessment work was much more general last than for several years before, it is certain that a large number of claims were neglected and it is also quite probable that a goodly portion of these will be relocated.

BLACK HILLS BULLION.—The production of the Deadwood Terra Mining Co. for the first half of December was \$22,176 from 8846 tons of ore. The production of the Homestake Mining Co. for the first half of December was \$34,667 from 10,240 tons of ore. The company's credit balance increased from \$55,603 on Oct. 1st to \$50,396 on Nov. 1st.

IRON HILL.—The Iron Hill Co. has commenced shipping matte accumulated from recent runs by the smelter. The plant will blow in again for another

and continuous run some time during the present month. Ore from the company's recent purchase, the Calumet, will be put through. This purchase will prove a valuable one to Iron Hill stockholders. The ore is full of pyrites, a valuable factor in the process by which it is to be treated. A portion of the ore will go to the Galena smelter when it is started up, some time shortly after the Iron Hill plant blows in.

IDAHO.

YREKA DISTRICT.—Wardner *News*, Jan. 1: Among other promising claims in this district which have been patented during the year are the Idaho & Silver Casket lodes, the first westerly extensions of the Sierra Nevada. Over \$1000 have been expended in development of these claims this year, and in the near future they will be thoroughly and systematically developed. These prospective bonanzas are owned by R. E. Brown, J. G. Gable and C. F. Furbush.

LOWER CALIFORNIA.

AMONG THE MILLS.—Alamo *Nugget*, Dec. 28: Col. S. H. Lucas returned a few days ago in company with Messrs. L. P. Goldstone and W. S. Bell of San Francisco. The colonel is an indefatigable worker, and we are glad to learn that he is succeeding in putting the affairs of his company in such shape as to enable them to begin active operations at their stamp-mill in Mexican Gulch. The company has been reorganized under the name of the Liberty Mining and Milling Co., Messrs. Goldstone and Bell are well pleased with Alamo. The Huntington mill, belonging to the International Co., is at a standstill, but we believe it will start up again soon. The new amalgamator, Mr. Dobler of San Francisco, will arrive here soon, at which time the El Paso mill will resume operations. The Alamo mill is grinding away again at a good rate on custom rock. We congratulate Mr. Lane on his vigorous policy. This mill is now and has been a favorite with the camp. Since the new Gates rock-breaker has been added and the new pump and bed plates are in place, it is thought that even better results may be expected than the record of the mill has already shown. The Torres mill under efficient present management is doing good work and running quite steadily. Mr. Moore recently bought a large amount of ore from the Asbestos mine, which will produce an excellent cleanup.

MONTANA.

STRUCK IT RICH.—Three assays made by J. C. Pyle, the Granite assayer, for John Whiting, of samples from his recent strike in the Montana, Red Lion district, run as follows: No. 1, 112.40 ounces silver and \$2524 gold; No. 2, 110.6 ounces silver and \$968 gold; No. 3, 11.5 ounces silver and \$112 gold. Mr. Whiting now thinks himself a millionaire, and if the above result continues even one-tenth as good he will have millions. Mr. Whiting refused a bond on the property for \$20,000 the other day.

DUNKLEBERG DISTRICT.—Mining in the Dunkleberg district is keeping apace with other mineral sections in the State and at present is experiencing quite a boom. The Forest Rose, which is at present the most valuable mine in the district, is looking well. They are now shipping one carload of ore each day and have about 40 carloads on the dump ready for shipment with plenty more in sight in the mine. The Rose is likely to be one of the richest mines in Deer Lodge county. There is some talk of the Hatta starting up again, but it is doubtful if this will be done before spring opens up. Numerous prospects are being worked and all are looking extremely well. It is expected that with the opening of spring there will be quite a stir in the district.

UTAH.

CAMP CROSSCUTS.—Park *Record*, Jan. 4: The Crescent mill inaugurates shipments of first-class ore by means of sleds in a little while. Shipments of ore have been rather light again this week on account of the drifting snowstorms. Since the heavy snowstorm several miners have come down from the mountains and are engaged in working their Treasure hill and other properties near town. The road to the Anchor has been about as effectually blockaded as it is possible to be, and this has caused a delay in starting up the shaft-boring machinery, but it is believed that a good start will be made today. The shaft on the Silver King property, just above the Mayflower No. 7, is down about 100 feet and the calculation is to go down another 100 feet before drifting. The indications for ore are very favorable and it is possible that the shaft will open into ore at any time. Work continues at the Creole No. 2, though not on as large a scale since the leasers were notified by a representative of the Townsite Company that he claimed the ore for trespass and damages. More ore is being sacked up and it is still believed that the troubled well be amicably settled. The Nevada-Northland leasers have secured the services of Jas. T. Kessel as night foreman, and they are taking out ore with as much speed as possible and at the same time are opening new ground on the vein. The Nevada-Northland ore is very high-grade smelting and shipments to market will be gradually increased. Developments at the Woodside are of a very satisfactory nature and more ore is being taken out of the tunnel workings. The new strike is a big one. In running the south drift from the 200-foot level of the shaft a nice vein was struck a few days ago, and it is believed that it will open out into a big body of ore. Another important strike has been made in the Comstock mine. Only a few days ago the south crosscut, commencing from a point 750 feet in the tunnel, revealed a fine seam of ore which assays well in silver and lead. The crosscut is in about 40 feet and will be continued. Work will be kept up at the Comstock all winter and by spring everything will be in readiness to put up the big hoisting works and sink the shaft to a depth of 600 feet on the vein.

ORE AND BULLION SHIPMENTS.—The Ontario bullion shipment for the week was 38 bars, containing 23,051.25 fine ounces of silver. During the week the Mackintosh sampler received and forwarded 520,000 pounds of Ontario ore; 278,750 of Mayflower No. 7 leasers'; 89,150 of Woodside, including 24,830 of dump sortings, and 52,100 of Nevada-Northland leasers' ore; total, 940,000 pounds.

MECHANICAL PROGRESS.

Failure of Copper Steam Pipes.

Quite a discussion is going on in England over the frequent failures of copper steam pipes. The failure seems usually to take place at the seam where the pipe is brazed together, and quite naturally, since the pipe at this point is thinner than elsewhere and is composed of brass instead of copper, a metal of much less tensile strength. The trouble is that the most careful workmanship is needed to insure a good joint, and as surely as the brazing is imperfectly done, trouble will ensue.

The *Engineer* also propounds the hypothesis that a steam pipe is often subjected to much vibration and bending stress, which the brass at the joint will not endure, even when the brazing is thoroughly well done. In this way is explained the fact that pipes which have borne 300 pounds pressure under test have afterward burst open when working under half that pressure. Various remedies are proposed and tried for the trouble. In the Hamburg-American steamer *Columbia* the builders have wound the steam pipes with wire. Steel hooping and the use of seamless drawn copper tubes have been suggested, but for the large pipes the elbows must still be made of sheet metal.

The real remedy is very tentatively suggested by the *Engineer*, which says, mildly: "It may yet be found practicable to produce steel tubes deserving confidence." To an observer on this side the water it would seem that very ordinary steel pipe, such as may be bought for a fraction of the price of copper pipe, is deserving of a great deal more confidence than a pipe with a longitudinal seam whose strength is dependent on the success of the delicate metallurgical operation of brazing.

It may indeed be that it is not possible to use steel steam pipes in marine practice, but our cousins over the water were once sure that nothing but a copper fire-box would do for a locomotive until we, through our necessity, found out better. We are not inclined now, therefore, to take their assertion that it is necessary to make steam pipes of copper as settling the question.

Our contemporary, the *Engineer*, indeed says: "It is urged that steel tubes are liable to corrosion, and that scale is blown from them into the engines with bad results; also that they are not sufficiently flexible. Seeing that there are hundreds of miles of iron pipes in use on land, these objections are more imaginary than real; but perhaps the best pipe of all would be galvanized steel."

From the theoretical point of view, it would certainly seem that steel rather than copper is the proper metal for steam pipes. The boiler itself, which is subjected to the corrosion of the hot salt water, is made of steel; and since the steam pipe is subjected ordinarily only to the action of water condensed from the steam and practically free from saline matter, there seems little need of protecting the pipe from corrosion. In case the formation of scale proves an objection, it would seem an easy matter to prevent its reaching the cylinders by placing a separator next the engine.

We are not informed what practice American builders of marine engines are now following, but for our new naval vessels, at least, in whose success all are interested, it would certainly be best to refrain from following ancient practice in this matter, at least until careful tests have proved that mild steel is not a proper material for steam pipes.—*Engineering News*.

A Probable Famine in English Hematite Iron Ore.

The English correspondent of the *American Manufacturer* has for some time been asserting that there was a great possibility that a short supply of hematite iron ore would soon be encountered by English iron-masters. These prognostications are now fully considered as more than a matter of "probability." The *Manufacturer* says: The consumption of hematite ores by the furnaces on the west coast of England in the past few months has been on a scale much in excess of the production, and had it not been for the large stocks of ore that were held at various mines the production of pig iron would have been very much restricted, and both ore and pig iron reached a price that they have not yet attained. By the end of the year, however (which has now been reached), these surplus stocks will have been exhausted, and the makers of hematite iron on the west coast will have to depend, so far as relates to English ore, upon the output of the mines, which is insufficient to keep up the present rate of production.

In view of these facts vigorous efforts are being made to discover new deposits of ore. The west coast hematite ore region is being searched by owners of royalties with an energy that they have not displayed for many years; an energy that is being stimulated by the fact that these ores are worth from \$4.25 to \$4.50 net at the mine, and it is no wonder that prospecting is being pushed when such tempting prices are ruling. The average value of these ores in 1887 was but \$2.30 and in 1886 \$2.64.

The makers of hematite iron in England are not only searching their own country for increased supplies but are looking to foreign sources, in addition to the large amounts usually brought from Bilbao and elsewhere. Some

cargoes of ore from Carthagena have already been sent from the west coast and others are to follow.

Such a falling off of this most indispensable character of ore, in connection with the constantly increasing demand for the same, will no doubt soon result either in an active demand in England for American hematite ores, of which we have an abundance, or a call for American high-class iron in Europe.

HORSE NAILS BY THE BUSHEL.—We have already made notice of the invention of a machine for the manufacture of horse-nails. We give below from the Toronto, Canada, *Journal* an account of the working of such a machine in London: Some practical exhibitions of a novelty in the way of horse-nail-making machinery have recently been given in London, Eng. It is the invention of Mr. G. P. Capewell, and is an ingenious mechanical appliance for greatly increasing the rate of production. The entire process is automatic. A coil of wire is at the top, and one end being inserted the machine is set in motion, and in a very few seconds a constant stream of finished nails comes dropping out at the bottom. The following details of the work are, as stated, all carried out automatically: A short piece of wire is cut off and by a series of dies is drawn out to the required length; it is then beveled, pointed and headed. Each piece passes through a dozen operations consecutively, without the intervention of hand labor at any one of them. The machine is completely under control, and there is an arrangement by which it stops automatically if a nail fails to pass through any one of the operations. It is said that each machine will produce over 600 pounds of average-sized nails per day of ten hours. The nails produced were subjected to hydraulic tests, and the results are greatly in favor of the Capewell machine for producing strong nails of most perfect shape. There appears to be very little waste material, and we are told that this does not amount to 10 per cent. It is proposed to form a company to produce and work this machine in Great Britain.

A LAND-CLEARING MACHINE.—A Santa Rosa inventor has devised a machine for clearing land that is attracting attention. Concerning a recent trial on Guy Grosse's place in Rincon valley, the *Democrat* says: With its use stumps and trees which it would take an experienced and stalwart wood-chopper half a day to remove from the soil, are dragged out by the roots, scarcely the smallest fibrous vestige being left in the ground, in two and three minutes, and apparently without the expenditure of great force. The ease with which these stubborn impediments to agricultural development are removed is due to the mechanical construction of the machine, which is in the form of a capstan. Around the drum of the capstan a heavy cable winds, the other end being attached by means of a heavy chain to the stump or tree. This cable is 160 feet in length, and, by means of a patent block, any part of it can be hitched to the tree. The shaft which turns the drum is 15 feet in length and is drawn with ease by one horse. Dividing the length of the shaft by half the diameter of the drum—five inches—it gives the multiplying power of the machine as 36. By the means of another block, the power of the machine is increased to 72 times that of the horse which turns the shaft. The machine works on a hillside as well as on level ground, and two acres of land may be cleared without changing its position.

NICKEL STEEL is attracting the attention of metallurgists as the result of a paper read before the Iron and Steel Institute, in May last, by Mr. James Riley of Glasgow. It is claimed that tests made with an alloy of 95.3 per cent steel and 4.7 per cent nickel showed an increase in breaking stress from 30 to 40.6 tons per square inch, and the elastic limit was raised from 16 to 28 tons. The hardness can be increased 20 per cent. Steel rich in nickel is practically non-corrodible, 25 per cent of nickel increasing this quality in the proportion of 10 to 870. Some of the breaking strains are said to have reached 87 and even 95½ tons per square inch. The possibilities of this new alloy are among the nickel producers, and especially the Canadian Copper Co., which claims to have the best nickel mines outside of New Caledonia.

METALLIC RAILROAD TIES seem to be constantly but gradually working their way into general use. About 600 metallic ties have recently been laid on the track of the Chicago & Western railroad at Chicago. These are the first metallic ties that have been laid in the West. The tie is a metallic trough in which the rails rest upon a wooden block, thus avoiding metal contact, and are clamped firmly and securely in place without the use of fish-plates or angle-bars. The necessity for drilling the rails is thus obviated, and they are notched only when creeping plates are used under the joints. In riding over the tracks the change in passing from the wooden to metallic tie is said to be very noticeable in the greater smoothness.—*Trade and Traffic*.

GERMAN PATENTS.—During the recent discussion of the German Patent laws in the Reichstag, it was revealed that last year Germany granted only 321 patents, against England's 9779 and the United States' 20,420. While in most civilized countries the number of patents annually granted is increasing, or, at least, not decreasing, the number in Germany has fallen off 927 in the last five years.

SCIENTIFIC PROGRESS.

Phenomenal Gifts.

Peculiar gifts in relation to the power of the uneducated human mind in certain given directions are frequently brought to the knowledge of the world, and as yet without the remotest idea being suggested in regard to the laws or means by which these peculiar gifts are brought into power. The reader will readily call to mind Blind Tom, the pianist, and quite a number who have manifested this peculiar power in regard to figures. Indeed, music and mathematics seem to be the two directions in which these remarkable developments are generally made; although there are other directions in which they sometimes appear. The celebrated Sweet of New England is an example of this kind in surgery.

The latest novelty of this has appeared in the vicinity of Louisville, Ky., in the person of an uneducated negro. A late reference to this person is given by the Louisville *Commercial* as follows: Sam Sammers, the negro prodigy, was in town recently, and, as usual, entertained a large crowd, who were testing him with all kinds of mathematical problems. Sammers is a negro 34 years old, without the slightest education. He cannot read or write, and does not know one figure from another. He is a common farm hand, and to look at him and watch his actions he seems to be about half-witted, but his quick and invariably correct answer to any example in arithmetic, no matter how difficult, is simply wonderful. With the hundreds of tests that he has submitted to, not a single time has he failed to give the correct answer in every instance.

Some examples given him were as follows: How much gold can be bought for \$792 in greenbacks if gold is worth \$1.65? Multiply 597,312 by 13½. If a grain of wheat produces seven grains, and these be sown the second year, each yielding the same increase, how many bushels will be produced at this rate in 12 years, if 1000 grains make a pint? If the velocity of sound is 1142 feet per second, the pulsation of the heart 70 per minute, after seeing a flash of lightning there are 20 pulsations counted before you hear it thunder, what distance is the cloud from the earth, and what is the time after seeing the flash of lightning until you hear the thunder? A commission merchant receives 70 bags of wheat, each containing three bushels, three pecks and three quarts. How many bushels did he receive? And so on.

With Robinson's, Ruy's and other higher arithmetics before them, those who have tested him as yet have been unable to find any example that with a few moments' thought on his part he is not able to correctly answer.

Stanley's Geographical Discoveries.

It will probably turn out that Stanley's latest geographical discoveries in the equatorial regions of Africa have been of as much importance as those made by him on previous expeditions, or that have been made by any of the African explorers. There is more than a hint of the value of his recent discoveries in his announcement that the Victoria Nyanza is a much larger body of water than had heretofore been shown on any map. Stanley's discoveries add 1900 square miles to this lake; and what is of even greater importance, it is shown that it extends so far south that the actual distance between the Victoria Nyanza and Lake Tanganyika is only 155 miles, whereas the distance heretofore computed has not been less than 250 miles. These two lakes afford a length of navigable waters somewhat exceeding 500 miles. The other lakes, as they are figured by the best authorities, have navigable waters hardly less in extent. That is, there are about 1000 miles of navigable waters afforded by these great inland seas.

Now, the nearer they are to each other the better it will be for all the future interests of commerce. Of two of these great lakes, steamers have been plying for many years. The theory has long been a favorite one that all the navigable lakes of Equatorial Africa would finally be joined together by short lines of railroad, and that the lakes thus united would become a great commercial highway in Central Africa. These lakes have already become of new importance in that sense, by the organization of the Free State of Congo, which, while it nowhere borders on any of these waters, has an exterior boundary near enough to derive great benefit from the future development of commerce by means of this great chain of inland navigation.

OBSERVATIONS ON ECLIPSES OF THE SUN.—Professor David P. Todd of the late expedition to the west coast of Africa to observe the eclipse which took place Dec. 22d, says that the chief purpose of these observations is not to find the distance to the sun, as many suppose, but to find out with the highest degree of accuracy the position of the moon's diameter relative to that of the sun at several recorded instants of observation. The data so obtained bear directly upon the betterment of the numerical data from which the astronomer predicts the position of the moon and is a matter of serious moment in the future of the science of navigation and in further improvement of astronomical tables and theories of the motion of the moon. But in addition to this purpose, the last 20 years have seen a great development

of the science of solar physics, and observations of the solar corona, only seen at time of total eclipse, have much to do with this science. No one yet knows what this corona really is, and its study is depended upon to still further develop our present imperfect knowledge of the laws governing solar energy and the constitution of the sun itself. The importance of taking advantage of every solar eclipse can be appreciated when it is understood that in the last 100 years only a few hours over one day have been available for this purpose. Photography is the most powerful adjunct of the eclipse observer of to-day. These plates preserve the precise figure and relative brightness of the corona and all its streamers with the highest precision, and permit careful and leisurely study to supplant the hasty and imperfect observations of only a few years ago. Spectroscopic investigation is also added to photography.

A GLASS TELEPHONE.—Jerome Prince of Milford, Mass., while lately reflecting upon the varied musical sounds given out by glass tumbblers, when more or less partially filled with water and properly manipulated, conceived the idea that these vibrations might be brought to some practical utility in connection with the telephone. With this conception he immediately set to work to demonstrate his idea with the following result, as given by the Boston *Journal of Commerce*. "The new telephone" which he has constructed, "consists of a diaphragm or transmitter of simple glass, resting on a number of glass rods, and these communicating with an ordinary wire. The line in operation at Milford extends from a grocery on Main street to the residence of one of the proprietors, a distance perhaps of some 30 rods, passing some five or six sharp angles before reaching its destination. Over this wire the ticking of a watch can be distinctly heard, and a whispered conversation carried on with no difficulty whatever. The distance that sound can be transmitted with the new telephone varies according to the thickness of the glass transmitter. The one in consideration allows a whispered conversation three miles, and by using a thicker glass a much longer distance. It makes no difference how many angles the wire takes in reaching its destination, the sound is transmitted just as readily. Another peculiarity of the invention is the increased intensity of the sound that is transmitted. Each vibration seems to gather strength and force from the vibrations behind it, and when the sound reaches the ear of the auditor it is wonderfully clear and distinct."

THE WIND AT TOP OF THE EIFFEL TOWER.—Careful observations were made last summer to determine the difference in the velocity of the wind at 65 feet above the ground at the Eiffel tower and at the top, 995 feet above the ground. Up to the 1st of October last complete observations had been obtained for 101 days, and from these it appears that on an average the velocity of the wind is about 3.1 times as great at the more lofty station as it is at the lower. Moreover, the breeze at the top is always fairly strong, as during the whole of the summer months in which observations were taken, the average velocity of the breeze throughout any given day always exceeded 23 ft. per second, and during 21 per cent of the whole period of the observations this average daily velocity was upward of 33 ft. per second. No great storm seems to have occurred during the time over which the observations extend, and we do not know the maximum wind velocity registered during this time.

THE HEIGHT OF OCEAN WAVES has long been a source of much speculation among scientists and others. Various means have been adopted to reach accuracy, but hitherto with very little success. Perhaps the following may be considered as near perfection as any device hitherto employed. We copy from an exchange: "An interesting feat has just been accomplished by Hon. Ralph Abercromby, who has succeeded in measuring the height of ocean waves by floating a sensitive aneroid barometer on the surface, and in gauging their width and velocity by timing their passage with a chronograph. As a result of these experiments, he reports Admiral Fitzroy in the conclusion that waves occasionally reach an altitude of 60 feet. The highest wave measured by Mr. Abercromby was 46 feet high, 765 feet from crest to crest, and had a velocity of 47 miles per hour."

THE GULF STREAM.—It has been noticed for many years that the flow of the Gulf Stream appears to be approaching nearer and nearer to the Eastern coast of the Union. The question just now seems to have acquired a new interest, due to an article recently published in the Boston *Transcript*, by Lieut. Downes, U. S. N., wherein that gentleman states that this great ocean current is now flowing nearer to the New England shore than has probably ever been known before. This is in part at least owing to the weakness of the Arctic current, and its entire absence at times, in the North Atlantic. Lieut. Downes thinks this proximity of the warm Gulf Stream to our coast accounts for the comparatively mild, open winters of the past two years.

FORESTS AND THE RAINFALL.—A drought which has prevailed in South Africa is said to be due to the same cause that ruined Egypt, Mesopotamia and India, once the most fertile countries in the world. It is the destruction of the forests.

ELECTRICITY.

Electrical Progress.

A great advance in the application of electricity for the purpose of light and power during the present year will certainly exceed that of all previous time. A glance at the columns of any of the weekly electrical journals of any date during the past year will show that hundreds of arc and thousands of incandescent lamps, and miles of electric railway have been constructed for.

Electric motors, says *Stationary Engineer*, have been manufactured at a rate of upward of 250 per week, and their average rating will exceed 700 horse-power.

The series system of incandescent lighting, which gives cheap distribution over extended areas, and can be easily and cheaply extended at any time, is being adopted by villages, and is hailed as a blessing by the older people, whose eyesight is growing dim as age advances.

The incandescent lamp in the homes of people of very moderate circumstances is a fact of to-day, and the price at which it is furnished is found to be within their means. This is another triumph in the field of electric lighting, for the incandescent light can now be introduced into places where gas will never be able to compete. The flexibility and simplicity of the series incandescent system will make it the poor man's friend, for in any place where underground wiring is not compulsory, the incandescent lamp can be furnished at a less cost than would be charged for the same amount of light from gas. Electric railways are so rapidly multiplying in the United States, that reliable data is old and comparatively worthless by the time it is compiled.

Motors have been introduced for all conceivable purposes to which power can be applied, and small industries run by electrical power have started up in many places where steam-power could not have been utilized. Motors of all the different designs that have been proven of value find a ready sale, and the factories engaged in their manufacture are, in many cases, being enlarged. The storage battery is being extensively applied to the many purposes for which it is applicable.

FUSIBLE FIRE-PLUGS FOR ELECTRIC LIGHT WIRES.—Mayor Hart of Boston, who has been visiting a number of cities, studying their electric-light systems, was recently in Chicago. To a reporter he is stated to have said that he believed that the only means to guard against the danger to buildings from fire from the electric wires was by using fusible plugs, placed outside the building and protected from water. As to the usefulness of these appliances to a certain degree, there can be no question, but we hardly think Mayor Hart meant to be quoted as pronouncing them the only means of safety. That electric lighting will soon be made as safe from accident as illuminating gas hardly admits of a question. If our metropolitan Solone will use their endeavors to secure means of safety from electric fires as earnestly as they are now seeking to put a stop to one of the most important discoveries of the age, they will accomplish much more good. Electricity in all its phases has come to stay, and don't you forget it.

FROM MR. EDISON.—Mr. Edison recently said to an interviewer: "At the present time the phonograph is occupying my time. I have been improving it, and it is more perfect to-day than ever. In speaking into the phonograph it was soon found that the syllables were not recorded. For instance, if I were to say 'species' the 'sp' sound would be lost. Well, I have about solved the problem now, and the sound of 's' is inscribed with the other letters. I run the phonograph or graphophone in three ways—with a treading, a battery, or with the ordinary incandescent light by attaching the machine with a wire to the lamp. Business people can have their choice. I shouldn't want to be bothered with a treading, and I think the best plan is to use the electric light, since they are now so commonly distributed. The battery is made to last for a month, three months, or six months, without being renewed. Let every man take his choice. I am making the three kinds."

A NEW ELECTRIC LIGHT COMPANY.—Articles of incorporation have just been filed by the Central Electric Company with \$250,000 capital and \$6000 subscribed stock to construct and maintain electrical apparatus in the cities and towns of the Pacific Coast. Directors: C. F. Fargo, J. Redding, L. L. Baker, G. P. Adams and C. E. Wilson. A proposition is before the City Trustees of Sacramento for an electric light franchise—to introduce into that city a Westinghouse electric light plant, to light the streets of that city.

RUTHLESS DESTRUCTION.—It was recently reported that a gang of linemen was engaged in the ruthless destruction of telegraph and telephone lines in the city of Cleveland, O., and that they were encouraged in the nefarious work by an enraged populace, simply on account of the death of a horse.

TO INVESTIGATE THE ELECTRIC LIGHT.—Two gentlemen from the Celestial Kingdom named Wong and Fong were in New York recently,

for the purpose of making a study of what to them is a never-ceasing wonder, the electric light. They are said to represent a Chinese syndicate which has a ninety years' contract with the Imperial Government to furnish all the public buildings and offices with electric light. They will go from New York to Pittsburgh to continue their study of the subject.

WHY NOT REPUTATE STREET CARS AND ILLUMINATING GAS?—The records of deaths in the city of New York showed that there were killed by street-cars during the year 1888 no less than 64 persons, and by illuminating gas 23, making the number killed by the electric current (5) insignificant compared with the deaths of individuals from any of the other causes named.

SO IT IS SAID.—The operator of an electric car at Pittsburgh, Penn., reversed the current very suddenly, a few days ago, and the iron-work became so heavily charged that two passengers received severe shocks.

AN IMPORTANT INDUSTRY.—It is estimated that 250,000 persons in the United States are engaged in business depending solely on electricity.

ENGINEERING NOTES.

THE LAKE ERIE AND PITTSBURG SHIP CANAL. Preparations are being made for the preliminary survey of a feasible route for the projected ship canal between Pittsburgh and some port on Lake Erie, by which lake ores and other commodities can be taken without transshipment from the Northwest to the Smoky City. Much interest is felt in the project, which is certainly a most important one, and one, also, that will undoubtedly succeed. The iron manufacturers and iron ore and coal miners, especially, will encourage the enterprise. The questions by which its projectors are just now confronted are (1) Can it be done? (2) What will it cost? and (3) Who will pay for it? These problems will be considered in detail and at length by a State commission appointed by the Governor, and backed up by a legislative appropriation of \$10,000 for a preliminary examination. Three routes are proposed—one via the old Pennsylvania canal, which at present is popular; one will pass through a portion of Ohio, and the third is rather mysteriously, just now, kept in the background. One of the principal difficulties in the way will be the undermining or bridging of the numerous railroad tracks along any route which may be adopted. There will also be many railroad "kickers" to contend with among the companies which may be paralleled by the canal. The question of cost or difficulty of securing funds will not present any special trouble. The city of Pittsburgh would be immensely benefited by the work in getting cheap and needed ores from the Lake Superior and other regions in the Northwest. It is an enterprise of national importance and must soon be carried through.

THE WATER RAILWAY.—The scheme of a water railway to draw ore at a speed of 100 miles an hour, which attracted much attention at the late Paris Exposition, is to have another trial under the patronage of the London Metropolitan Railway Company. The location selected is near the city of London. The *London Spectator*, in alluding to the scheme, says: "We shall soon have an opportunity to try what, if accounts are true, must be the very poetry of motion. The carriages run on skates or slides, but between the slide and the rail is forced a film of water, which prevents all jolting, bumping and shaking, and, in fact, makes the carriages skim along as the heat does on the sea. Then, too, the pace is 100 miles an hour. If the new railway is really practicable for long distances, all England will be a suburb of London, and Surrey will be saved from becoming a chessboard, covered with what the auctioneers call 'villa residences' standing in their own three acres of park-like grounds. A hundred miles an hour would make Bath as accessible as Brighton, while Manchester would be reached in one hour and 50 minutes."

A MILK PIPE LINE is talked of for the supply of New York with its indispensable lacteal supply. A company has been formed with a capital of \$600,000 to start the enterprise. One of the projectors says: "The scheme presents many difficulties, such as the milk becoming sour or churned, but we can deliver it in a half-frozen condition if we want to, and prevent its souring or churning. We shall probably be able to send milk to New York from towns within 100 miles of the metropolis for one cent a gallon. The concern can be as easily controlled as a telegraph system. We shall be able to send milk to the city in one hour." The main difficulty will be in keeping the conduits in thorough sanitary condition.

PRESERVING THE SACRAMENTO RIVER.—In regard to the duty of the General Government to preserve navigable streams, an exchange very correctly says: "It is the first duty of the Government to keep navigable rivers in a navigable condition. Railroads can never supersede waterways. A single barge will carry as much food or material of war as a train of cars, and a single tug will haul a dozen snob barges."

GOOD HEALTH.

Poison in Pickles.

Dr. Jackson, a Pittsburgh physician, recently analyzed a number of samples of pickles and catsups. In almost all the matter he found more or less salicylic acid, used by the manufacturers to prevent fermentation. In two-thirds of the samples there appeared fungi or molds, which indicated that the tomatoes had begun to ferment and grow moldy before the salicylic acid was added. Arsenic was found in one sample and sulphuric acid in another. The coloring matters used were largely cochineal and aniline red. About one-third of the pickles analyzed contained impurities and adulterations. The matter was chiefly in the vinegar, and the former was in both vinegar and pickles.

Of the ten samples there was copper present in two, oil of vitriol in seven, lead in one, iron in two and zinc in one. This is certainly a bad showing. Out of all the adulterations used, cochineal is really the only harmless one. As for the lead, iron and zinc, it is assumed that their presence was accidental, as a result of the action of the acid on those metals with which they had come in contact.

Salicylic acid is a very common adulteration of foods and drinks; milkmen have used more or less of it, and it is said that it is a frequent ingredient of lager beer. In fact in almost everything in the line of foods which undergo fermentation, this acid has been used as a preservative. Manufacturers contend that it is harmless in the quantities in which they employ it. Could the consumption of the foods and drinks containing it be limited, this agent would not of course do much harm, but appetites cannot be anticipated. Many people crave acids, and some are very fond of catsup, and eat it freely with almost every kind of meat. Physicians give salicylic acid for acute rheumatism, but it cannot be continued long, for the reason that the stomach very quickly becomes irritated and intolerant of it. This acid is a poison and capable of producing death in large doses. Even if small doses are taken for a long time the nutrition of the indulger is so impaired that he loses flesh and strength. As to the effect of the mold found in the catsup on the system, it is only necessary, says Dr. Jackson, to state that a number of years ago an experiment found that when rabbits were fed on moldy bread their ears sloughed off, decalcifications made their appearance and finally death resulted. Diluted sulphuric acid is sometimes given as a medicine, but only that which has been prepared with exceeding care. In the acid generally used to adulterate vinegar there is very likely to be a trace, at least, of arsenic. As for copper, no one can justify its use in food.

Dr. Jackson gives the following wholesome advice to those who purchase catsup: "In the first place, avoid a highly colored article, for the chances are that much coloring matter has been added to disguise the color of half-ripened or rotten tomatoes. Again, do not buy a low-priced article. When you see an array of catsup bottles in a window, with a price-card on them showing that they are being sold at half-price, don't you buy that catsup; it is not fit to go into a human stomach."

The writer has known of a bargain-hunter who walked four square out of her way to get a catsup that was sold five cents cheaper than better grades. Examination showed that catsup to be filthy; it was a network of moldy fiber. Considering how long a bottle of catsup will last, five cents is a very small saving to the purchaser, yet that much difference in price means a great deal to the manufacturer, consequently he cannot afford to put as good tomatoes in it, nor make it up so carefully as the better quality, so that this grade contains most of the rotten tomatoes, the sweepings, etc., all colored up nice and red with roseaniline. Whose fault is it that this kind of preparation is on the market—the manufacturer's? Not exactly. It is the fault of the bargain-hunter, who wants to get something for nothing—the bargain-hunter who holds a 5 cent piece so close to her eye that she cannot see the dollar behind it.—*Boston Herald.*

FALLING FROM A HEIGHT.—It may mitigate the distress with which we hear of terrible falls to read the following from the *New York Medical Journal*: "A medical man, formerly a sailor, states that in his youth he fell from the top-gallant yard of a vessel, a distance of 120 feet. Sensation was entirely lost during his transit through the air. It returned slightly on entering the water, sufficiently to enable the lad to strike out (being a good swimmer) and seize a life buoy. The writer thinks death would have been painless had he fallen on some hard substance; but the assertion that persons die in the act of falling is, he thinks, evidently wrong."

COFFIN NAILS.—In some parts of the West cigarettes are quite commonly referred to as "coffin nails." This is by some considered unjust to coffin nails, which are, in their way, useful and even necessary articles.

NEAR-SIGHTEDNESS is over-running the French people as much as the Germans. Among the senior boys in the different French colleges more than 46 per cent are near-sighted.

USEFUL INFORMATION.

BRIQUETTE MAKING IN PENNSYLVANIA.—The Reading Coal Co. at Mahanoy City has adopted a system of briquette-making from coal-dust. This waste-saving process consists of the coal-dust being evenly distributed with one-tenth per cent of pitch. This, by an ingenious contrivance, is pressed into large cakes, steam being used to moisten the mass. So hard does it become that it possesses the same power of resistance as coal, or, in other words, 100 pounds of coal dust pressed will last as long as the same amount of hard coal. A pressure of 35 tons is brought to bear on each briquette. There are two presses in operation now, and when run to their full capacity will turn out about 800 tons of the briquettes in 24 hours. The briquettes take up 25 per cent less space than ordinary coal, and in consequence an engine can be loaded to go one-fourth farther without replenishing the supply of fuel.

THE WHALE.—Comparison with other living bodies must be made in order to form any adequate conception of the magnitude or weight of a whale, which is, by far, the largest specimen of a living thing on the earth. Nilsson remarks that the weight of the great Greenland or right whale is 100 tons, or 220,000 pounds, or 110 tons, equal to that of 88 elephants, or 440 bears. The whalebone in such a whale may be taken at 3360 pounds, and the oil at from 140 to 180 tons. The remains of the fossil whale, which have been found on the coast of Ystad, in the Baltic, and even far inland in Wangapause, Westergothland, betokens a whale which although not more than between 50 and 60 feet in length, must at least have had a body 27 times larger and heavier than that of the common or right whale.

TO LESSEN ACCIDENTS.—A very useful invention, tending to lessen the possibility of accidents in factories, is now being extensively adopted in England. The breaking of a glass, which is adjusted against the wall of every room in the mill, will at once stop the engine, an electric current being established between the room and the throttle-valve of the engine, shutting off the steam in an instant. By this means the engine was stopped at one of the mills recently in a few seconds, and a young girl, whose clothes had become entangled in an upright shaft, was released uninjured.

EARS AS CIGAR HOLDERS.—The women of Borneo, like the male smokers of Siam, use their ears as cigar-holders, but in quite a different way. Every Burmese girl prides herself on the size of the hole she can make in the lobe of her ears. Some of them reach the size of an ordinary napkin-ring. Into these they often place their cigars. The Burmese cigar is generally of a mammoth size—an inch or more in diameter and from six to eight inches long.

FIRST AMERICAN COAL TO BRAZIL.—The first cargo of the American bituminous coal that has been known to be shipped direct to Brazil was taken by the schooner Hannah McLoon, which recently sailed from Philadelphia for Santos. Many efforts have been made to introduce coal from this country into Brazil, but every attempt was opposed by a combination which refused to handle the American product.

TO TAKE OUT GREASE FROM MARBLE.—Apply a little pile of whiting or fuller's earth saturated with benzine, and allow it to stand some time; or apply a mixture of two parts washing soda, one part ground pumice-stone, and one part chalk, all first finely powdered and made into a paste with water; rub well over the marble, and finally wash off with soap and water.

HOME HAND-GRENADES.—Any one can make the hand-grenade fire extinguishers, and at a small fraction of the prices charged in the market. Any light quart-bottle will serve to hold the solution, which is composed of one pound of common salt, one-half pound of sal-ammoniac, dissolved in about two quarts of water.

TO BERLIN BY SEA.—Serious attention is now being paid in German official circles to a scheme for connecting the Baltic and Berlin by a sea-going ship canal. The question as to whether this could best be brought about by deepening the Elbe or the Oder is at present under the consideration of a committee.

A KNOT AND A MILE.—Comparatively few newspaper readers know, or have any special reason to know, that a knot is more than a mile, and that six of the former equal about seven of the latter. Accurately speaking, there are 6086.7 feet in a knot and 5280 feet in a mile.

JAPANESE CEMENT.—It is said that a stone has been discovered in Japan which has remarkable qualities as a cement material, and can be worked up for a much less price than the imported article costs. The cement will bear a weight of 400 to 500 pounds per square inch.

IMPORTED WEEDS.—Of the seven weeds which the "Weed law" of Wisconsin requires farmers, under penalty, to destroy, only one is a native of the United States, all the rest being naturalized importations from Europe, where they are common wild plants.

Passing Events.

The unprecedented storms have soaked the ground so full that the quartz mines have more pumping to do than usual, and in some places heavy snows have impeded work by blocking up ditches and roads.

The railroads in the State have been having a hard time of it for some weeks. Floods in the south and heavy snows in the mountains have given the division superintendents plenty to do. Up at the Summit they have had 16 feet of snow on a level and the big rotary snowplows have been kept busy.

Since our last issue, the mining town of Wardner, in the Comor d'Alene region, Idaho, has experienced a disastrous fire; seven persons have been killed by a snowslide at Sierra City, and the hoisting works and shops of the Anchor mine, Utah, have been burned. The bodies of the men buried in the Utica mine cave have not yet been recovered, nor are they expected to be for some time.

Word has been received that the only successful one of the total-eclipse expeditions was that sent out from the Lick Observatory, California, through the liberality of Chas. F. Crocker, who paid all the expenses. The party met with clear skies for their observations, being more fortunate than the Government or private parties.

A vast deposit of sand was some time ago discovered in Placer county, which makes very valuable glass material. A company has been incorporated, with a capital of \$50,000, with the object of establishing a manufactory of glass in the county on a large scale.

The Silver Problem.

In last week's editorial under the caption "Windom's Silver Policy Defended" we should have entered more fully into the outside price to be paid by the Government in Treasury notes for silver hillion deposited in any one of the United States mints. The outside price to be paid is \$1 for 412.5 grains standard silver. Leading bankers in this city concur in the opinion that by standard silver the Secretary most unquestionably means the United States standard, 900 fine, which is one-tenth less than the highest commercial standard, 1000 fine, on which all quotations are based. This being the case, then, in 412½ grains of United States standard silver there are 371½ grains of silver of 1000 fine, so that the Government will pay \$1 for each and every 371½ grains of silver, 1000 fine, which is equivalent to over \$1.29 or par, for each and every ounce of 480 grains.

As we have before said, Secretary Windom's plan has several features that commend themselves, not the least of which is the making of the United States, and not European countries, the controller of silver; for any foreign government wishing silver hillion in this country must either enter the open market and bid up for it or else buy United States Treasury notes and ask for their payment in hillion at the market value of silver.

If Secretary Windom's compromise plan is liable to receive favorable action, himetallists should insist upon the placing of gold on the same footing as that of silver, for what is sauce for the goose is sauce for the gander.

Already several silver bills have been introduced in Congress; among them is that of Senator Bland, demanding free coinage. This is, by far, the better course to pursue, and which must, sooner or later, come, not only in this country but in all leading commercial countries. The large and constantly increasing growth of trade demands more money, either silver and gold or else paper currency, based on the two metals, which latter can be demanded and at once received on presentation of the paper representative.

No country can have too much money; history from time immemorial confirms this well-established fact, and therefore the United States should not be an exception, as it now is, for by a scarcity of money corners can be more successfully run by the unscrupulous.

In substantiation of the fact that no country can have too much money, we will give the statistics of the amount of money in circulation at latest date for which they are reported in the following countries:

Country.	Paper.	Gold.	Silver.
Germany.....	\$207,551,732	\$348,729,000	\$214,240,000
France.....	596,591,466	873,000,000	597,900,000
Great Britain.....	203,534,617	587,683,000	93,164,000
United States.....	918,581,833	375,917,715	110,485,452

In France it is ooduced by political economists that the masses are more prosperous than they are in any other civilized nation. This was fully attested by the alacrity with which the call for the German indemnity fund was responded to, as money came in quickly from all classes. Notwithstanding the heavy losses met through the Franco-German war, France's recuperative power was attested by its again soon taking the lead in general prosperity. No one has yet had the hardiness to assert that it was not to the large money currency of that country its prosperity has been and still is largely due. Although hi-metal, yet France holds nearly as much gold as both Germany and England combined, which should put to the blush those gold-hugs who fear dire disaster if we fully and unequivocally adopt hi-metallism.

John Jay Knox's plan to perpetuate the National Banks is hardly deserving notice. No paper currency should be issued except by the National Government, and not even by it unless redeemable at the will of the holder in either gold or silver, or both, if so desired. The National Banks were called into existence in perilous times, and have survived their usefulness. The National Bank notes now in circulation should be replaced by Treasury notes issued by the Government against silver.

The fire in the Anaconda at St. Lawrence mines, Montana, is practically out. The mines have been sealed since Nov. 23, but were opened this week. The shafts are full of gas and no one has gone down, but no signs of fire are apparent. They have been injecting steam into the mines ever since they were closed.

Standards of Measure and Weight.

The Prototype Recently Brought to the United States.

On the 2d of January, 1890, the sealed boxes containing the prototypes of the meter and the kilogramme were opened by the President of the United States, in the presence of several of the heads of the Departments and of scientific men, at the office of the United States Coast and Geodetic Survey. These standards are one set of "national prototypes," constructed under the direction of the "Bureau International des Poids et Mesures," at the Pavillon de Breteuil, near Paris.

This International Bureau was organized in 1875 upon the previous International Meter Commission of 1872. In 1875, 16 Governments, including the United States, formed the International Bureau, and later four other Governments joined—Great Britain as late as 1884. All the work and experiments were done at the cost of the Governments subscribing. The standards adopted by the high contracting powers were the "meter and kilogramme of the archives of France." The prototypes were to be made from an alloy of platinum 90 per cent, and iridium 10 per cent. The meter was to have a length of 102 centimeters, a cross-section nearly X, a weight of about seven pounds, and the gradations marking the meter near each end were to be traced on the neutral axis. Standard thermometers were to accompany each meter and each kilogramme.

The form of the kilogramme was to be a cylinder, whose height should equal the diameter, with the edges slightly rounded and the designation marked simply by a difference in the furnishing.

The accuracy of comparison of the meter was to be within one-tenth of a micron, or one two-hundred-and-fifty-thousandth of an inch; and the "tolerance" or difference of the prototype from the standard was fixed to be plus or minus less than five microns, or one five-thousandth of an inch, the quantity being known, of course, to the one-tenth of a micron.

The meter of the archives is an "end measure," and a "provisional standard," with gradations, had to be determined therefrom; the comparisons were made according to a method proposed by Fizeau. There were many difficulties to be overcome in this measurement. Finally the new provisional standard was accepted from which the lengths of all the other prototypes were determined.

These preliminary operations were carried on through 10 years, when a London firm, Johnson & Co., was selected to furnish the metals, which required 18 months of continued experiments and trials to produce in the required purity. The Messrs. Brunner of Paris constructed the meter bars, which were rolled by several operations into the required form. To the "Conservatoire des Arts et Metiers" was assigned the gradnation near the ends of each bar. Then the Director of the International Bureau made the final comparisons of all the different meters with the provisional standard and with each other, and from a mathematical dissection of the observations, derived the final difference between each and the provisional standard.

Among the different kilogrammes assayed to be standard it was finally agreed in 1882 that the kilogramme KIII in platinum iridium should be the international prototype, and the limit of "tolerance" was fixed at plus or minus 0.2 milligramme, and the comparisons are made to the one-tenth-thousandth part of a milligramme, and the final correction given to the one-thousandth part of a milligramme, or the one-sixty-seven-thousandth of a grain.

Many supplementary studies were necessary to know the character of the meters; their rates of expansion, their length between gradations when asported at different points, their possible change of character after long travel, etc. The whole subject of a standard thermometer was investigated and settled. It is reported that the length of the meter remains the same, whether the bar is supported at one point in the middle or at the two ends; and in the comparison of the kilogrammes it is said that two weights placed one above the other in vacuo differ from what they would if placed side by side, because the upper weight is farther from the center of the earth. If weighed in the air, the second disturbing element would be the

different density of the atmosphere in the place of the two weights.

The 31 prototype meters were distributed to the different Governments on the 28th of September, 1889, and on behalf of the United States, Hon. Whitelaw Reid, Minister to France, received two of three prototypes of the meter and one of the two prototypes of the kilogramme. These were, by direction of the Secretary of State, through instructions from the Superintendent of the United States Coast and Geodetic Survey, delivered to Prof. George Davidson of that service, who carried them from Paris to Washington, where they were delivered on the 27th of November to Prof. T. C. Mendenhall, the superintendent. The form of receiving, transmitting, opening and identification of these standards was based upon a similar proceeding when the standard English pound was delivered to the United States Mint at Philadelphia many years since. It was originally intended that Prof. Davidson should be present at the opening before the President of the United States, but his duties called him to this coast.

At the office of the United States Coast and Geodetic Survey in Washington comparisons will be made between the new standard meter and the one which has been heretofore the authority of the United States, and henceforward it will be the absolute standard of the United States. The kilogramme will, in like manner, be subject to comparisons with other weights, and their relation thereto will become known and the standard established therefrom. Primarily this will reach the coin weights of the United States, to which earnest and exhaustive experimentation will be given. These coin weights are made under the direction of the Superintendent of the United States Coast and Geodetic Survey.

Electrical Engineering.

It is noticeable just now when so much attention is being directed to experimenting with electric street railroads, that there is a great demand for "electric superintendents." A good many of the failures are attributed to incompetent superintendents. When the electricians turn the roads over to the companies, in what is supposed to be good running order, more or less difficulties are met. Then the ordinary street-car superintendent is at sea, and an ex-telegraph operator is not any better off.

Here is a field for young men who are willing and ready to study and prepare themselves for the work. Those who are expert in their work now have all they can do, and there is room for many others.

In fact, electric engineering is a coming profession. So much attention is now being paid to electric lighting, electric power, electric railroads, etc., and the field in all these branches is so constantly widening, that there are opportunities for the present and future for those with knowledge of electricity and its appliances. The young men who now take up the study of electricity as a profession will be in a few years those who will be in charge of large companies and work.

MINING STOCK ASSOCIATION.—At the annual meeting, held on last Wednesday, of the Mining Stock Association of this city, all the old officers were re-elected. At the meeting a resolution was introduced and unanimously adopted, instructing the president and secretary of the association to communicate with the Congressional delegation from the Pacific Coast, asking them to give their undivided attention in favor of the free coinage of silver.

NORTH BLOOMFIELD CONTEMPT CASE.—The old-time North Bloomfield Mining Co. case was up before Judge Sawyer once more the other day. This time the company's officers were cited to show why they should not be punished for contempt in hydraulicking in spite of the order of court. The matter was argued by Statesman Cross of Nevada City, and taken under advisement.

THERE has been some danger of a strike at the Union Iron Works because the managers desired the men to contribute 30 cents a month each so as to secure the services of a surgeon in case of accident. The men objected, and some of them refused to work, but the matter will possibly be settled without further trouble.

The Mining Belt of Peru.

NUMBER II.

The Basin of the Cerro.

The basin of the Cerro is formed by an irregular circle of hills surrounding it on all sides. It is composed of a series of small terraced plains and of a low central ridge, the site of the town and the larger part of the mines. The central ridge is the Cerro (hill) de Pasco. It is about one and one-half miles long by three-fourths of a mile wide. The town is laid out on its backbone and eastern slope, while its western slope is substantially occupied by a series of immense quarries or open cuts called *tajos* or *tajos abiertos*. Mines have been worked to a greater or less extent over all parts of the ridge, as well as on some of the hills bordering the basin. Many of the mine-openings are inside of yards in the town, some are in the streets, and the majority now worked are in or around the *tajos*. The altitude of the town is 14,193 feet above sea level.

The most striking feature of the place is formed by the huge *tajos* which line the western slope of the ridge and pass into and through the town limits, threatening its existence, as indicated by the ruined buildings around the edges of the pits. Huge cracks in the ground adjacent to these *tajos* are constantly opening and perhaps closing, but attract no notice from the residents, except in the case of the special family whose dwelling commences to fall.

The *tajos* were formed originally by the caving of the mines. During 250 years, since 1630, the miners have been burrowing like moles under the surface, driving here and there in a most unsystematic manner, crossing and recrossing the same ground, extracting the richer ore and dumping the poorer where most convenient, and afterward returning for this poorer ore; and all this time making no attempt to secure the ground except for the moment, or to provide for future operations. They have excavated huge chambers underground and left them to stand or fall as might chance. An untold number have fallen; some have stood and are still to be seen, 150 to 200 feet long, 50 to 75 feet wide, 15 to 25 feet high; and labyrinths of connecting passages and chambers exist, so intricate that, without a guide, one dare not penetrate far into them for fear of getting lost. When the Tajo Matagente first caved, 300 men underground are said to have perished.

A *tajo* once formed is constantly enlarged by subsequent caving, by falling of the sides and by quarrying of the walls. The superficial area of the *tajos* of Sta. Rosa and Tingo (which connect) is about 41 acres, of Tajo Matagente

ment of the upper zones, a result intensified by periodical saturation of the mass with water during the rainy seasons.

The climate of the Cerro is unusually wholesome for those having proper conveniences of life and plenty of warmth and ventilation, but disagreeable and trying to some constitutions; and I should advise against long-continued residence without occasional changes to warmer regions. But at distances of eight or ten miles from the Cerro in almost any direction, by de-

andesites, slates and sandstones and the argenterous formation. Fig. 3 shows their relative positions. Fig. 4 is a general section across the basin from east to west, so drawn as to include the main elements of the rock series. If the line of this section were traced on Fig. 3, it would run from Parajirca hill southwesterly to the center of Tajo Santa Rosa, and thence northwesterly to Pargas ridge.

[Unfortunately we have not space to give the details of Mr. Hodges' observations on the

Above the water level, the formation consists of a highly metamorphosed and greatly oxidized material, of constantly varying structure, color and composition. Over a large portion of the town-ridge there is a hard, compact, reddish or yellowish and very quartzose cap-rock of ever-changing thickness. Below this, as a rule, the formation is softer and more decomposed, being sometimes broken into loose or cemented fragments of all sizes, and passing by all gradations of structure and hardness, but without any evident regularity, into earthy masses or soft clays or sugary sands. The smaller fragments, whether loose or cemented, are often so arranged as to present a slate-like appearance. A hard gray quartzite is frequent; porous material resembling scoria is met now and then; and a rotten slate, generally pyritic, is not uncommon. Local evidences of stratification may be seen, but generally on a limited scale; and everything of this kind is irregular and indistinct.

The rock is everywhere very silicious, always yielded considerable percentage of slimes when crushed wet, and everywhere contains at least traces of silver, of pyrites and of carbonate of lead (and of lime). Very rarely is the silver visible, even with the aid of the magnifying glass, and then principally in small native scales in connection with quartzite.

It is noteworthy that the decomposition of the mineral constituents does not always proceed gradually from the present surface downward. Very hard and very soft rocks often adjoin, and large bodies of solid pyrites in a chalcidonic matrix are found at varying depths, and generally in close proximity to greatly oxidized material.

Gold occurs in the merest traces, and thallium has been detected in the ballion. The condition of the silver has not yet been satisfactorily determined. All direct tests for chlorine have given negative results. A part of the metal is unquestionably in a metallic state, as may be seen occasionally. Undoubtedly it exists in varying combinations in the different classes of ores. The sulphurets of copper, silver and iron are common to the formation above and below water level. Native copper occurs rarely; zinc is reported in all analyses, and galena at times rich in silver is found in bunches south of the large copper deposits.

Below the water level there is evidence sufficient to show that under the highly altered surface rock there are slates, sandstones and limestones, in strata which (according to Rivero), like everything east of the andesite, have a general northerly and southerly strike and an easterly dip, which contain quartz, calc-spar, pyrite and chalcopyrite very generally, and often in high percentages, and in which rich deposits of sulphurets and occasional native silver have been found in times past.

After a long study of the ground, I have been led to the conclusion that the surface rocks and the deep deposits are made up of essentially the same materials and differ chiefly in the degree and kind of metamorphism which they have undergone.

My impression is, that the site of the present Cerro was once covered with strata (more or less horizontal) of slates and sandstones, and, to a certain extent, limestones, which now form essentially what I call the argenterous formation; that these strata

TOPOGRAPHICAL AND GEOLOGICAL PLAN OF THE CERRO DE PASCO.

ascending the steep ravines, one can reach places where is a soft and pleasant climate, and where the vegetation is abundant and beautiful.

Physical Aspect.

Fig. 3 is a general topographical and geological plan of the basin of the Cerro. The whole region around the Cerro at first sight is apt to appear dispiriting. The trails are rough. Barren hills of limestone, slate and sandstone,

geology of the district, and must confine ourselves to a condensation of his remarks on the argenterous formation.—EDS. PRESS.]

The argenterous formation lies between the limestones on the east and the andesites on the west, and forms the central ridge on which the town is built. At the north it rapidly narrows, as shown on the plan, while at the south its boundary is undefined, there being no ex-

GENERAL SECTION ACROSS THE BASIN OF THE CERRO DE PASCO, PERU.

about nine acres, of those of Olayac about the same as the last.

It is impossible to determine, with any exactness, the amount of material removed. The present sides, sometimes formed by toppling crags, vary from a few feet to hundreds of feet in height. From the lowest point of Sta. Rosa tajo to the top of Sta. Catalina hill, which is moving into the tajo, is a measured vertical height of 329½ feet.

If, for the sake of a general estimate, we assume the average depth of the Sta. Rosa and Tingo *tajos* to be 100 feet over a superficial area of 1,800,000 square feet, we have 180,000,000 cubic feet, or somewhere near 9,000,000 tons, extracted at this locality alone, from vertical depths ranging up to 350 or perhaps 400 feet. The removal of any such amount has naturally resulted in constant caving and move-

often in strangely-contorted or sharply-tilted strata of Jurassic and Cretaceous age, rise abruptly on all sides. The pampas are rolling, generally covered with short green grass, and especially in the wet season, abounding in treacherous hogs. In the vicinity of the Cerro the numerous mining haciendas, sometimes perched in unexpected places, form quite a feature in the landscape. Wherever water to run stones can be obtained, even if the supply is only for a few months in the year, there the *ingenios* have been erected. The combined grinding capacity of all these haciendas is about 185,000 tons a year.

Geology.

The mining belt of Peru is made up of rocks of Jurassic and Cretaceous age. In and around the basin of the Cerro there are visible on the surface limestone conglomerates, limestones,

platory work here. The area developed may be roughly stated as about one and one-half miles from north to south by three-fourths of a mile from east to west. It is very fully exposed for a maximum depth of 300 feet by the mines and *tajos* along the backbone and western slope of the ridge. Elsewhere it is imperfectly open to inspection.

This formation has long been a geological puzzle. The present attempt at a partial solution of the problem differs from all preceding theories on the subject principally in the respect that it combines in one formation rocks which have heretofore been considered radically different. The dividing line between the surface deposits above water level and the "deep deposits" below water line may be taken roughly as occurring near the general level of the Quilacocha tunnel.

have been repeatedly tilted, the western portions being gradually raised until they came to or above the present surface line, and naturally are more broken and altered than the easterly parts which now occupy levels below them; that there have been various eruptions of andesites, which rocks are now visible on the west of the argenterous formation on both sides of San Andres pampa; that accompanying or following these eruptions, there have been ejected from below siliceous and metalliferous solutions which have attacked most strongly the more broken portions of the strata, impregnating them with silica and silver and other metals, and otherwise altering them, such metamorphism being reinforced by subsequent exposure to atmospheric influences and intensified by succeeding eruptions of the andesite; that the

limestones at the east were deposited before the time of the latest upheaval and impregnations which tilted and cracked them, and formed and filled with ore the veins now seen in them; and that the last period of the geological history was that of the final weakening and erosion which gave the surface rocks their present outlines and appearance, and of the deposition of the limestone conglomerate visible at the south and west.

THE PAMICO-GARRISON DECISION.—In the final decree in this interesting mining case, Judge Rising said: "I see no reason to change the view I expressed on the last day of court in Hawthorne upon the rendition of the verdict, in substance, that the form of the decree under the findings of the jury will be that the apex of the east and west veins are within the surface boundary lines of the Pamlico location, and that these veins in their course downward cross the side line of the Pamlico and enter the Lakeview ground; and according to Act of Congress the plaintiff has the right to follow them where they go. As to the fourth issue, the jury has found that prior to and at the commencement of this action the defendants asserted an adverse claim to property of the plaintiff, and the plaintiff is therefore entitled to recover costs. So far as the third finding of the jury may be inconsistent with the first, second and seventh findings, I decide that the east vein and the vein exposed in the Eagle incline—at least at its intersection—are one and the same. This fact is uncontradicted by any evidence in the case, and the vein at the Eagle incline, therefore, is part of the Pamlico east vein. By the finding of the jury the defendants are entitled to the vein exposed at the Badger Hole, in the Bellview upraise, and extending from there and connecting with the Bellview tunnel, and at the Hartson tunnel, and has its apex in the Lakeview ground."

Educational.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

PRACTICAL

Books on Mining AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warnford Lock. 738 pages, with 8 plates and 271 engravings in the text. 4to, cloth, \$15.00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Ross. This work embodies the information collected during four and a half years of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Saragases, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price \$15.00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, only a few copies left; price \$25.00. Handbook to the Historic Mines of Mexico, price \$1.00.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

E. & F. N. SPON, Publishers,
12 Cortlandt St., New York.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron hangers for top saw. Friction feed-works, patent steel screw double-throw head-blocks, with track iron, saw carriage and frame complete.

Noticas of Recent Patents.

Among the patents recently obtained through Deway & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDRANT COUPLING.—S. M. Hackley, S. F. No. 418,513. Dated Dec. 31, 1889. This is one of that class of couplings especially adapted for connecting the hose with the hydrant; and the object is to provide a coupling which can be readily and quickly manipulated, forming a water-tight joint. The invention consists in a two-part swinging or hinged coupling applied to the end of the hose and automatically tightening itself under the pressure of water on to the hydrant screw.

SECTION DREDGE.—John W. Brown, S. F., assignor to the Golden State and Miners' Iron Works. No. 418,496. Dated Dec. 31, 1889. This improvement in section dredges consists of an improved construction of what is termed the "ladder-joint," at which point the vertically movable section-pipe is connected with the stationary portion of the pipe which is fixed upon the scow. By the construction adopted the inventor greatly simplifies the joint connecting the movable and stationary sections of the section-pipe, and also the journals or trunnions about which the movable portions are raised or depressed.

SETTING SPUD AND CAOE FOR DREDGERS.—Alonzo P. Payson, S. F., assignor to the Golden State and Miners' Iron Works. No. 418,471. Dated Dec. 31, 1889. The invention relates to a device for moving and setting the scow upon which a dredging apparatus is carried, so that the scow may be advanced to a certain distance, which distance is equal to the amount of cut which can be excavated by the dredger. It consists of a supplemental spud moving vertically in guides upon a frame at one side of the dredger scow, guiding channels fixed to the side of the scow, so that the spud passes down through these channels, the length of these channels being equal to the distance which it is desired to advance the scow from time to time, and in connection with this a chain or rope passing around the pulleys and connecting the independent spud-frame with the gipsy by which power may be applied to haul the dredge forward the length of the guide-slot or channel.

PULVERIZER AND CONCENTRATOR.—Irwin W. Helwig, Pottstown, Pa., assignor of one-half to S. K. Soodgrass, Delaware, Ohio. No. 418,514. Dated Dec. 31, 1889. This is a device for pulverizing and concentrating gravel, earth, or other auriferous material, and is especially adapted for use in placer mines, where the earthy material needs to be broken and pulverized in order to separate the gold. It consists essentially of the combination with a pulverizer and its operating mechanism of a vibrating concentrator, having its bottom formed of wave-like surfaces and depressions, and having ledges overhanging the pockets, means for vibrating the concentrator and an inclined chute between the pulverizer and concentrator.

SHIRT.—Frank Batter of Slide, Humboldt county, assignor of one-third to P. C. Levar, Sonner, O. No. 418,639. Dated Dec. 31, 1889. Great discomfort is often caused to the wearers of shirts by reason of the pressure upon the outer end of the back collar-button which is transferred to the bones of the spinal column with greater or less severity. This invention is designed to do away with this difficulty by the use of the flexible tapes attached to the inner portion of the shirt-band, so as to pass through the button-holes of the band and be secured by a peculiarly constructed pin, which may, if desired, also pass through a button-hole in the center back portion of the tie, so as to hold that in place at the same time.

List of U. S. Patents for Pacific Coast Inventors.

The following brief list by telegraph, for Jan. 8, will appear more complete on receipt of mail advices:

California—Henry Anderson of San Francisco, metallic roofing; Henry Bryan of Modesto, shoe for thrashing machine; Robert E. Davis of San Diego, wave motor; Loyd C. Vibert of San Francisco, oat-huller; Patrick F. Duncan of San Francisco, discharge door for steam-lighters and retorts; Julius Finck of San Francisco, annunciator; John J. Griffith of San Bernardino, track gauge and folding bed-screen; John L. Hazlett of San Francisco, combined ruler and pencil sharpener; F. Littlepage of San Jose, well-boring apparatus; Bartlett McIntire of San Francisco, saw-etting machine; Leonidas C. Presley of Brooklyn, N. Y., and W. Lombard of Wheatland, Cal., check-cutter; Olaf Quist of Colton, life-preserver; A. Fred J. Salisbury of Eugene, wind-mill governors; Joseph Thompson of Decoto, knife-cleaner; Benjamin Walton of Compton, bird-trap; Peter Welandner of San Francisco, ventilator for boots or shoes.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

On Wednesday five miners were buried by a cave in the Victor coal mines, near Trinidad, Colo.

Market-Place Scene in Nicaragua.

(Concluded from page 19)

There will be five entrances and the building will contain 50 rooms. In the center of the building, facing west, there will be a large lecture-room, provided with all the necessary tables and instruments used in demonstration, and capable of accommodating 200 persons.

Three rooms, each communicating with one another, and so arranged as to be made as one, will be provided for laboratory purposes. The dimensions of the rooms are as follows: 58 2x 32 9; 49 9x35.4; 34x38 4. In the old building accommodations were provided for only 60 students, whereas in the new one ample room is provided for 200 students.

The capacity of the institution will be more than trebled. A small lecture-room will be made for special purposes; also several rooms in which students can pursue their studies in special subjects, and other rooms for general use connected with the laboratories, such as storerooms, sitting-rooms, and rooms for study.

On the north side of the building a museum-room will be built. A wing, to extend from the north end of the structure, size 43 6x27.10, will be used as an organic laboratory and a combustion and store room, and in the center, about the center of which will be the complete building, there will be five rooms to be used as reading, sitting rooms, etc.

The present design calls for ample accommodations for 125 students, which is double the capacity as now provided in the south hall.

Academy of Sciences.

The annual meeting of the California Academy of Sciences was held on Monday evening last. The Committee on Election announced that Dr. H. W. Harkness had been elected president for the ensuing year by 89 votes out of 127 cast. The following other officers were elected: First Vice-President, H. H. Behr; second vice-president, Geo. Hewston; corresponding secretary, Frederick Gotzkow; recording secretary, J. R. Scowden; treasurer, I. E. Thayer; librarian, Prof. Carlos Troyer; director of museum, J. G. Cooper. Trustees—Chas. F. Crocker, D. E. Hayes, S. W. Holaday, Geo. C. Perkins, E. J. Molera, Irviog M. Scott, John Taylor.

The president read his report, which was a resume of the year's proceedings. According to it there are 257 members of the academy. Five died during the year and five were admitted.

Charles F. Crocker as chairman presented the report of the trustees. The board, immediately on its election last year, began work on the academy building, and at present nearly all contracts for construction are given out. The building, which is on Market street, near Fourth, will be ready for occupancy before the end of this year. A review of transactions with the Lick Trustees was also given. A note and mortgage for \$300,000 had been signed last September to the trust. Miss Flood had been paid \$4500 for interest in a division wall, and \$1200 has been received from the Crocker Scientific Investigation Fund, out of which \$960 had been paid. The Bank of California had been selected as custodian of the academy's money. Most careful and searching investigation had been made by the trustees regarding the new building, and the mode of construction adopted was considered most perfect. The total amount for contracts given out to date is \$218,346, which includes entire cost of building, except elevators and glass lights for sidewalk. Already \$117,045 of this amount has been paid, and there are ample funds on hand to defray the entire cost of building.

The treasurer in presenting his report said he did not segregate the various items so closely as in former years, owing to the building accounts being so large an addition. Last January there was a balance on hand of \$2936 06, of which \$2185 04 was from the general fund and \$751.02 from the Crocker fund. During the year dues received amounted to \$1151; interest from Crocker fund, \$1200; from general fund, \$1375; cash received from Lick trust, \$288 969.40; rent of fence at new building, \$425 Total receipts, \$293 210 40, which, with the balance, amounts to \$296,156 46. Disbursements were as follows: From Crocker fund \$960; general fund, \$270 029.93; sundry, \$1.95; total, \$270 991 88. Balance in Bank of California, January 1, 1890, \$25 164 58.

The recording secretary was absent, and his report was not submitted.

Prof. Carlos Troyer, librarian, announced that the library had received 2193 volumes.

The Director of the Museum was absent, and did not present a report.

The Curator of Birds and Mammals reported that the year had been satisfactory, although lack of funds was an obstacle in much work that might have been accomplished otherwise. A committee of three is investigating the food habits of California birds, particularly regarding their destruction of fruit trees, etc. The catalogue recently compiled and now in press is the first one on birds in Lower California. The possibility of establishing a zoological garden near the city is looked forward to with great interest by the Academy.

The Curator of Botany reported that 5164 species of herbs and plants had been presented to the Academy during the year and was a valuable collection.

Attention, Southern California Miners.

WORKS FOR SALE.
The Works are situated at Daggett, Cal., in the Calico Mining District, and on side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery. Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS 123 California St., San Francisco.

DELINQUENT SALE NOTICE.

Booth Gold Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Auburn, Placer Co., Cal. NOTICE.—There is delinquent upon the following described Stock, on account of Assessment (No. 4), levied on the 23d day of November 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

NAMES.	No. Certificates.	No. Shares.	Am't
Richard Chenery, Trustee.....	160	6,275	\$125 50
Richard Chenery.....	17	5	10
C. A. les F. Eaton.....	171	300	6 00
Charles F. Eaton.....	172	300	6 00
Charles F. Eaton.....	173	60	1 20
R. N. Graves, Trustee.....	25	250	5 00
E. S. Harrison.....	177	1,000	20 00
Geo. R. Spinney, Trustee.....	82	312	6 24
Geo. R. Spinney, Trustee.....	176	500	10 00
E. P. Slosson, Trustee.....	181	500	10 00

And in accordance with law, and an order of the Board of Directors, made on the 23d day of November, 1889, so many shares of each parcel of such Stock as may be necessary, will be sold at public Auction, at the salesroom of Middleton & Sharon, No. 22 Montgomery street, San Francisco, California, on MONDAY, THE TWENTY-ETH (20th) DAY OF JANUARY, 1890, at the hour of 3 o'clock P. M., of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of the sale. GEO. R. SPINNEY, Secretary. Office, 310 Pine St., Room 25, San Francisco, California.

DIVIDEND NOTICE.

The German Savings and Loan Society.
526 California Street.

For the half-year ending Dec. 31, 1889, a dividend has been declared at the rate of five and forty-hundredths (5 40-100) per cent per annum on Term Deposits, and four and one-half (4 1/2) per cent per annum on Ordinary Deposits. Payable on and after Thursday, Jan. 2, 1890. GEO. TOURNY, Secretary.

BUTTE, MONTANA,

The railroad, mining and commercial center of the new State, offers some of the best inducements for investments in

Real Estate, Mines & Mining Stock

of any locality in the Northwest. For particulars address The Evans-Terry-Clausen Brokerage Co., 41 E. Broadway, Butte, Montana.

THE ROLLER ORE FEEDER

[Patented May 23, 1892.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,
227 First Street, San Francisco, Cal.

HORACE D. RANLETT,

Ores, Mining, and Commission,
420 Montgomery St., S. F.

Ships under advances to smelting works in Boston, New York, Baltimore and Liverpool. Twenty-one years' experience in Shipping Ores and Managing Mines.

Solicits Consignments of Copper Produce and Management of Mining Matters. All business conducted on Cash Basis. Purchase and shipment of Mining Supplies a SPECIALTY. Sales of Developed Copper Mines undertaken. Business Manager of UNION COPPER MINE, Copperopolis, Cal.; NEWTON COPPER MINE, Amador Co., Cal.

FOR SALE.

One Ohmen's 12x12 Automatic Engine; best style in use. Also, 1 Boiler 45 in. x 16 ft. Both nearly new. Apply to W. W. QUICK, 221 First St., (Top Floor) San Francisco, Cal.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
J. R. TROLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY. 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentes and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884.

CLOT & MEESE,

Sole Licensed Manufacturers of the

MEDART PATENT WROUGHT RIM PULLEY

For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of

SHAFTING, HANGERS AND APPURTENANCES.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all
Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than
can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long
distances with small loss, and is now extensively used in
all parts of the country for generating both power and
light.

APPLICATIONS

Should state amount, and head of water, power required,
and for what purpose; with approximate length of pipe;
also, whether the application is with reference to *Wheels*
or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given
amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Oble Cases, free of cost,
by applying to the manufacturers.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND
CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists,
Mining Companies, Milling Companies, Prospectors, etc.,
to our full stock of Balances, Furnaces, Muffles, Cruci-
bles, Scorifiers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast, we feel
confident from our experience we can well suit the de-
mand for these goods, both as to quality and price. Our
New Illustrated Catalogue, with prices, will be sent on
application.

Our Gold and Silver Tables, showing the value per
ounce Troy at different degrees of fineness, and valuable
tables for computation of assays in grains and grammes,
will be sent free upon application. Agents for the *Morgan*
Crandall Co., London, England. Also for *E. & J.*
Denniston's Silver Plated Amalgam Plates. The
plates of this well-known manufacturer are thoroughly
reliable, and full weight of Silver guaranteed. Orders
taken at his lowest prices.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Jan. 9, 1890.

General trade continues quiet, yet the trade is more hopeful than for years, particularly since the cold weather set in, which has frozen the snow, causing it to become more compact, and gives more assurance of a long summer supply of water. The money market is beginning to work easier, which will be more pronounced when the large sums paid in for taxes are put in circulation. The East reports an easier tendency. This is reflected in the strength of sterling exchange. The latter is in demand for remitting interest and dividends abroad. An Eastern authority on the disbursements of money for the payment of interest and dividends in this month presents a compilation of figures, showing that the interest payments for 1889 by railways and cognate corporations will amount to \$238,370,242, against \$210,289,281 in 1888, an increase of \$27,080,961, while the dividend payments will foot up to \$102,091,089, against \$106,341,399 in 1888, a decrease of \$4,250,310, leaving the total disbursements for interest and dividends at \$340,461,331, compared with \$316,730,680 in 1888, a net gain of \$23,730,651.

MEXICAN DOLLARS—The market, although still inactive, shows a slightly better inquiry. The market held steady at 75¢, but at the close shows more strength with an advancing tendency. **SILVER**—Purchases the past week were made by the Government at 96 cents up to and including Tuesday. Exporters were irregular, bidding all the way from 95¢ to 95.85¢. The close money market is said to have been against a more active inquiry. The strong and higher rates for sterling exchange is in favor of a better export movement, which, combined with an easier money market, ought to bring about still higher prices. The Carson mint continues to use the silver output of the Comstock mines. We still adhere to the opinion that the work now being prosecuted on the Comstock is to open up the Red lode, which is nearly all gold. How long it will take to run into this lode it is hard to say, also its extent and richness. There is nothing so uncertain as mining, owing to the difficulty of seeing what is ahead.

To-day's (Thursday's) telegrams quoted silver in London at 44½d, and in New York at 96½c, with both markets strong. In our market a sale is reported to have been made yesterday at 95.55 cts. One bank quotes 96½ cts. as bid to-day, but sellers name 97 cts., with nothing doing.

QUICKSILVER—Receipts the past week aggregate 66 flasks. The demand is slow, but the market has a strong tone.

BORAX—The market is reported quiet but steady. At the East the demand is slower, but the market is strong.

LIME—Receipts the past week aggregate only 606 bbls. With clear weather an increasing call is reported.

LEAD—A better tone is reported at the East, with which our market naturally sympathizes. There is a prevailing opinion that the market will do better. European advices report a strong market.

TIN—Imports the past week aggregate 25,029 boxes of plate. For spot the market continues easy, but for forward shipment prices are too high to lead to business. Late cable advices report the market weaker, due to realizing sales. The statistical position is in holders' favor.

COPPER—The market steadily advanced up to yesterday, when it shaded some. The weaker tone is not accepted as a bad omen, but, on the contrary, as a more favorable sign. There have been free sales, yet the market at the East and abroad has taken all and at improved prices. The visible stock the world over is largely reduced under an enlarged consumption. The movement so far has been entirely free from speculation.

IRON—Imports the past week aggregate 200 tons pig from Hull and 135 tons from Irondale. In the local market the demand is still slow, but now that the tight money market is tided over, an improved call is expected to set in. The markets at the East and abroad are reported by telegraph to be very strong under a continued good demand. The consumption in England is reported to have been phenomenally large in 1889, while the exports also show a marked gain. In the United States the consumption was also very large, considerably in excess of 1888.

COAL—Imports the past week were as follows: From Hull, 501 tons; Seattle, 2595; Newcastle, N. S. W., 7815; Nantaimo, 1070; Coos Bay, 450; Departure Bay, 2350; Philadelphia, 302; total, 15,093 tons. The local market is reported more active, owing to cold weather, for house coal, and clear weather for steam coal. The large output of coal collieries is a controlling factor against an advance in prices, as is the advanced winter in deterring dealers from carrying liberal stocks. A spot cargo of Australian is said to have been placed at a concession. For near-by cargoes the market is hard to quote, owing to dealers preferring to wait arrival. For prompt shipment it is difficult to get a correct idea, owing to dealers and large consumers appearing off-b. In Australian charters there is nothing new to report during the week.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Jan. 9, 1890.—The following are the closing prices the past week:

Mining Share Market.

The market for the Comstocks has, the past week, been more or less dull, with the tendency to lower figures. The prevailing opinion is that they will go slightly lower before there is much of a turn, and to help them down one or two more assessments are to be levied. In the outside stocks, the Tuscaroras have shown an undue degree of activity under the leadership of Commonwealth. Usually well-informed parties look with confidence to those stocks being still more active, with the movement based on merit in several of the mines. As the stocks of several of them are well concentrated, quite a successful deal can be made before the spring months are over. They will probably soon begin to pull bullion by telegraph. In the Bodies and Quijotas there is nothing doing. There are points out for still lower prices for the Bodies. So far the low price points have always come.

From the Comstock mines the official news is of a more encouraging character. The letters received yesterday (Wednesday) report that in Hale and Norcross, on the 1250-foot north drift, running toward Savage, they were in nine feet of good ore—car samples assaying \$35 a ton. This find is quite important. In Crown Point there is an improvement in the 300 south stope. The ore assays for the week show an increase of nearly \$3 a ton. In Con. Imperial in West Crosscut No. 2 on the 300-foot level there is a decided improvement.

In Alpha they are sinking on the ore found in the east crosscut 60 feet north of the shaft. On the 600-foot north lateral drift they are in low-grade ore. The work in Ophir and also in Con. Virginia is being closely watched, and as for that, all the work going on in the different mines is receiving special attention from mining men. The grade of ore begins to show a higher value. In this connection it is well for the association that is so bravely battling to reform the abuses of the Comstocks not to forget that they have an able coadjutor in the person of Hon. Francis G. Newlands, for he has succeeded in reducing the milling charges of some of the mills from \$7.50 to \$5 a ton. Not only has he done this, but he has increased the assay value of Yellow Jacket ore from \$7.50 to \$25 a ton. From the outside mines there is nothing new to report outside of the published official letters, which are of a glowing character from the Tuscaroras, good from the Quijotas and prospecting from the Bodies.

Now that money is getting easy, and John W. Mackay is expected to return soon, the chronic bulls on the Comstocks look for an improvement in the mining share market.

The bullion output of Crown Point in last month was \$38,616, and that of Con. Virginia \$263,760. Chollar's, Savage and Hale and Norcross outputs were not filed up to this (Thursday) morning.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

NORTHWESTERN G. & S. M. Co., Jan 4th. Location, British Columbia. Capital stock, \$1,000,000. Directors—H. P. Bowie, William Harney, W. W. Williams, Charles H. Plum, Jr., Edward Connelley, T. B. Berry and James D. Ruggles.

BEHRING SEA PACKING CO., Jan. 4th. Object, fishing, trading and mining. Capital stock, \$100,000. Directors—James Eva, James Madison, H. J. Bartling, Charles Lundberry and Chas. A. Johnson.

PACIFIC OCEAN BATHING CO., Jan. 4th. Object, to establish salt-water baths in this city. Capital stock, \$300,000. Directors—William Greer Harrison, E. A. Rix, W. T. V. Schenck, J. D. Sullivan and A. S. Murray.

ALASKA M. & M. Co., Jan. 8th. Location, Alaska. Capital stock, \$10,000,000. Directors—Thomas Brown, J. J. Jarboe, A. C. Corbier, G. A. Taylor and E. F. Stone.

BENICIA BRICK CO., Jan. 8th. Capital stock, \$100,000. Directors—G. F. and E. J. Duffey, J. E. Borland, A. S. Cheesbro, and John Boland.

CALIFORNIA LUSTRAL CO. (Oakland), Jan 8th. Object, a general mining and manufacturing business. Directors—S. S. Steel, Samuel F. Burbank, William F. Burbank, J. W. Dutton, Rufus B. Myers, Leighton W. Carson and Luke Doe.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

**IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS**

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and farther information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt . . . \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt . . . \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanner or concentrating devices. DAVID McKAY, JR.,
(Signed) Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

Compound Engines.

There is no other part of the United States where steam-power forms so important a place in general industry as on the Pacific Coast, nor where it is so extensively applied to mining, draining, agriculture, grinding, manufacturing, transportation, etc. The high price of labor compels its use in all possible cases. Among the first to construct compound engines on this coast were the Union Iron Works, who have applied the method in all of its different forms, and to engines of all kinds. The engines shown in one of the engravings on this page are those constructed to drive the main works of the Union Iron Works. They are compound and condensing, with variable cut-off gearing on the first or initial cylinder, and adjustable cut-off valves on the low-pressure one.

The cylinders are 16 inches and 32 inches diameter by 48" stroke, the steam being expanded to nine volumes. The engines are capable of a duty of 250-horse power, and consume only two and one-quarter pounds of good coal for each horse-power per hour. There is a greater gain by compounding when a condenser is used. In cases where fuel is dear, as on the Pacific Coast, and water for condensation can be procured, the extra investment for compounding and condensing is soon regained by the saving in running expense. The Scott & O'Neill out-off engine, also shown on this page, is an adaptation of the disc or poppet-valve system, with variable cut-off gearing to stationary engines. Such engines have been made for the past ten years by the Union Iron Works and applied to various purposes with great success, especially to cable railroad work and

SCOTT & O'NEILL PATENT COMPOUND ENGINE AT THE UNION IRON WORKS.

mining. The total number of engines of this kind constructed to the present time amounts to over 72,000-horse power.

A peculiarity and advantage of valves of this kind is the rapidity with which they open and close, and the large area of the ports. As usually constructed, the length of the perimeter of the valves is equal to twice the diameter of

the cylinder. For an engine of 18-inch diameter the length of the openings or ports, both for induction and exhaust, is equal to a slide valve covering ports three feet wide.

Another feature of these engines is that each is operated by an independent eccentric and can be adjusted at will to regulate the amount of compression and lead. The cross-head,

cranks, connection and other of the main details, are all made in accordance with the very best modern practice. The piston-rods are of steel and have patent metallic packing.

Fly-wheels, hand-wheels, rope-wheels or gear-wheels for transmitting power are shipped as wanted. Many of these engines have been arranged for rope transmission, and have performed very successfully with that method.

The cut of this 100-horse power Scott & O'Neill engine shows the valve-gearing and regulating mechanism. The four valves are actuated by the shaft seen in front, and connected with the main shaft by positive gearing. The governor and variable cut-off gearing are also driven from this same shaft, all the connections being positive, but adjustable and easy of access.

The valves are so constructed that they are continually rotating at each revolution, so the faces are kept true and steam-tight without adjustment or grinding. This is an important feature of the system, securing long endurance and economy of steam. The rotation of the valves is performed by the steam and without gearing of any kind.

The governor is driven positively, and is connected by links to the cut-off gearing. The resistance required for regulation is almost eliminated, so the motion becomes sensitive and regular under varying loads. When arranged in the compound form, the low-pressure cylinder has a similar valve arrangement; but the point of cutting off is usually adjusted by hand, the governor acting for the initial cylinder only. They also build them with a governor on both cylinders connected together, thereby giving the same relative admission of steam at all points of cut-off.

SCOTT & O'NEILL VARIABLE CUT-OFF ENGINE—ONE HUNDRED-HORSE POWER.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Californians in Holland and Belgium.

EDITORS PRESS:—We left Heidelberg at 3:50 P. M. for Mayence, arrived at 5:30 and put up at the Hotel de Rhine.

The country from Heidelberg to Mayence is similar to that from Munich to Heidelberg—level, with green fields and compact little villages every few miles, and hundreds of small hop patches. No pasture-lands, no good large barns for storing their crops, and it is a mystery to me what they do with their hay and grain.

I think, without exaggeration, I have not seen 200 head of loose stock out in the fields since I left France, and I am now in the fourth different country—Switzerland, Italy, Austria and Germany.

We changed cars at Darmstadt, and there met a gentleman and wife and son from Los Angeles—Matthay, I think, was his name. We were as pleased to see them as though they had been old friends, and we had a good American talk, and put up at the same hotel in Mayence.

This is quite a town, with some very old buildings. A tall tower close by the hotel they claim to be from 800 to 1000 years old. A fine bridge spans the Rhine, which is a little wider than the Sacramento. Here tourists take and leave the boat for a trip up or down the Rhine.

We take the boat at nine o'clock on the 15th.

A wet, gloomy, cold morning, with, perhaps, 50 passengers. The country is very level here, and the voyager does not get into the hills for an hour or so. The wind is blowing a hurricane, all but the cane, and this is the third time I have worn my overcoat since I left California—once at sea, once off the coast of Ireland and to-day on the Rhine. Not over half of the ladies can stay on deck, and it seriously interferes with the pleasures of the trip. I have read so much about the Rhine, heard it discussed by persons that have made the trip, and as some did not speak in flattering terms, I made up my mind to have no prejudice against it at starting. Some people get too exalted an opinion from others, and consequently they are disappointed when they come to view it. A person should see the Rhine before he sees the Alps or Switzerland, or he is liable to be disappointed. It is entirely different scenery and will bear no comparison. It is good and well worth the trip. The hills are well terraced with stone walls and grape-vines; the high peaks contain old castles and ruins and strong fortifications. We pass Bingen, Coblenz, Bonn, etc., etc., all famous in history or song. There is a railroad on either side with numerous tunnels. At the mouth of each tunnel there is a fancy wall, put up in imitation of towers or castles. The roads seem to do an immense business, from the number of trains we saw passing to-day. A great number of canal-boats were being towed up and down the river. There was not much farming, except grapes, until we got out of the hills and pretty well down toward Cologne.

Cologne is a much larger place than I anticipated. It has a very fine double iron bridge; one side for the public, and the other side, double track for cars, high enough for steamboats without lowering funnels. It has a pontoon bridge, with 42 pointed scow-boats, anchored in the stream, and a great deal of travel. The pontoon bridge was quite a novelty to me. When steamers want to pass, three of the boats were dropped down and behind the others and then pulled back in place by machinery. The streets of the old town are narrow, dirty and crooked. The new part is being built up in fine style. They claim the finest Gothic cathedral in the world. It cost away up in the millions. I am about tired of such luxuries, and I suppose I did not give it that consideration its mechanical merit deserves. I am tired of seeing these idle loafers in their black robes, to see something their grandfathers did.

They make everything work, eat or drink, in this country. The idle do most of the eating and drinking. They get more work out of their dogs than any place I have seen yet. One and two dogs are hitched to nearly every cart, and they pull with a will. I saw a three-tandem team. The man at end of shafts, one dog hitched to axletree, walking on the man's heels, the other dog hitched to the rear of the cart and walking behind the axletree, all doing good work.

They have some very old buildings, the architecture whereof must have been planned in some diseased mind. I took one of them to be the first handiwork of Adam when winter was approaching, and the other built from the wreck of the ark by Noah. I would give a good price for one of these country wagons to drive in a procession on Fourth of July.

We took the cars at Cologne at 1:30 and arrived at Amsterdam at 8 P. M. The country is well tilled, and shows a good growth of second crop of clover in blossom, alfalfa, grain, and an abundance of vegetables. Before we crossed the Rhine, we passed over very level bottom land, used mostly for grazing purposes. And here we begin to see stock out to pasture, and most of it is the black and white Holstein or Dutch cow. Occasionally there is a fence or hedge, but the land is mostly divided by ditches with small bridges and bars and gates.

We crossed the Rhine on a single-track iron ferryboat. String wire cables are fastened to either bank, passing over or around large wheels on the boat, which are revolved by steam pulling the boat. There are two boats, each boat carrying eight or ten cars. From here to Amsterdam is a level country, and water almost on the surface; feed was in abundance and thousands of cattle enjoying it. Nothing but the Holstein cattle are seen. The village system of farming is disappearing, and I occasionally see a farmhouse with barns, stacks, etc.

Amsterdam is built upon a site like that which might be found between Suisun and Benicia, on the tules. The map of the city looks like the three sides of a spider's web, the streets and canals running like the threads of the web, converging gradually toward the center. With all my reading about the city of Amsterdam, I had a very imperfect idea of it. I could hardly realize that there were as many canals as there were in Venice, and much better arranged. Nearly every street of importance has a canal in the center, with streets or roadway on either side. Some canals are 30, 40 and 100 feet wide, and some few narrower. There are 90 islands and 300 bridges that cross these canals from one street to another. Canal-boats are going and coming with their loads, like truck teams. Small steamers built low down ply up and down the largest canal, some as tow-boats and others for passengers.

The old houses are narrow and high, and not one in ten stands plumb. They look as though they would topple over very soon. There are some nice buildings here. It must be expensive to get a proper foundation in such a wet soil.

I believe they claim 300,000 population. I should hardly think it would justify such figures. We took carriage and rode around the city and out to see the dikes. Failing to get a proper map, I found it difficult to obtain the desired information in regard to reclamation. There are so many dikes, canals, levees, etc., that I could not inform myself as I would like to.

We found a young man who could speak good English and willing to impart anything that he knew, but the trouble was, he did not know much about the business and was liable to mislead.

We found another bright young man, apparently an assistant engineer, who had the information, but spoke indifferent English, and it was hard for him to explain. On the outer levee they were doing a fine piece of stone-work. From what I could gather and see, I think they are putting in gates to let out the stagnant water of the city at low tide and let in new water at high tide. They have reclaimed a good deal of land from the inland sea and have it in a fine state of cultivation. They have been most determined and persevering in building up this city and reclaiming its lands. It has cost an immense amount of money, thought and experiment.

I took the little steamer and went up to the town or city called Zaandam, that claims a population of 12,000. I had hardly got ashore when I was solicited by a native to be my guide. I made arrangements with him and we took carriage and started. The first thing he showed me was an old house that had cut over the top of the door, "Anno 1654." We left the carriage and walked through a narrow lane, where stood a modern house, 1825, over an old house built in 1632, and in which Peter the Great lived in 1697, when he worked at ship-building in this town. The chairs and table that he used were there. I had to stoop down to go through the door from one room to another. The boarding on the outside was over a foot wide and the whole thing had the appearance of quite an ancient house. I also walked through the ship-yard where he worked at his trade.

I went in and inspected one of those large, four-armed windmills that we see pictured so much in the old country. Each arm must be at least 30 feet long and they go with tremendous power. This one was pumping water from the land side into the canal. An old man and his wife were living in it and attending to it. Their three sons were at home at the time. The mills are worked with wooden cogs, and have a turntable, so as to be faced to the wind. There is a powerful brake they apply when they wish to stop the mill. They stopped it to show me how it worked. They seemed as pleased to show me the mill as I was to see it. I loaned the old lady a small reminder until I call again. The old gentleman seemed pleased at my attentions to his frau, for he put on a very broad smile, and gave a strong whiff to his pipe.

We drove several miles up a narrow street close to a small canal nearly on a level with the land. Houses were built on both sides, and nearly every house had to have a small bridge to get over to the street.

I am very sorry I cannot stay here at least one week and make a thorough investigation of this old city, with its remarkable history, its dikes and processes and extent of reclamation. Any account I can get of this city, I shall read with greater interest than ever. For want of time I have not visited its museums, art galleries, or zoological gardens, which are said to be good.

We left Amsterdam at 12:30, arrived in Brussels at 6 P. M., and put up at Grand Hotel de Saxe. Having a little spare time before we left, we took a run through a church founded in 1408, which had some very fine pulpit carving and

other oddities; also visited the King's palace. It is a large, plain stone building on the outside, and a person would hardly believe the beauty it contained within. Nearly every room was finished or covered with polished marble of the finest kind. It made a peculiar and rich room. Fine pictures were on the wall and on the ceiling. Each picture was emblematic or had a meaning and was appropriate to time and place. The equestrian statue of the father of the present King was in one of the large rooms. We regretted very much that we had to hurry through so rapidly, as we probably shall never see another marble palace like that, and it was a mystery to us how the economic Hollanders ever allowed themselves so much extravagance.

The trip was through a level country, with canals, ditches and levees everywhere; splendid green grass and thousands of the black and white Holstein or Dutch cattle in every direction. There were no fences, but some good large barns and good farm houses. I do not know that I ever went through such an extent of level ground and such fine feed and crops. In one town, about half the place was occupied with nursery trees, shrubs and flowers and of a very fine growth, and showed a good deal of skill in their training.

With all this rich soil, I had no desire to live on it, but would like to have owned a few hundred acres to turn my stock in to see them grow and get fat. We passed through The Hague and Rotterdam, large, fine places on level ground with water nearly on the surface. Quite extensive improvements were going on at Rotterdam, on the outside of the city, which showed thrift and prosperity.

We intended to stop at Antwerp, but concluded to go on to Brussels and stop as we came back to take steamer for London. We were more favorably impressed with Brussels than any city that we have seen on the continent, outside of Paris. There is a life, thrift and cleanliness about the city that takes right away and makes a person feel at home at once. The merchants have large show windows and have a knack of showing off their goods in a tasteful and attractive way, and causes a desire to buy something out of every window. We went to the lace manufacturers, which was a source of great joy to the three ladies in our party. If the skill of the fair hands in this city can prevent, our ladies are determined that mosquitoes and cold weather shall forever after be a stranger to them, while Mr. H. and myself sit in silent meditation, pondering the price of hops and bouquets in the future. Statues, monuments and columns are plenty. We took a ride on the electric street road which worked well for a distance of about a mile, and some of the way up grade. A great many wooden shoes are worn in this country, and the first pair I saw I thought from the size that the owner was about to perform some great feat in water-walking, so with purse in hand I followed him for awhile, desiring to purchase tickets for his exhibition. I soon saw so many with the wooden shoes that I thought I might see some of their feats without pay—a thing that never occurs in this country—so I saved my gulder and called at the corner to inquire the price of scheideid schnapps.

We were shown through the Hall of Justice, which is a large, fine building, and everything seemed well arranged. We were shown a room where every day, at certain hours, civil marriages were solemnized by the proper official.

We then went through the rain to visit the cathedral—a large, fine building, but no comparison to some that we have visited. Candles were burning by the hundred; men and women were at their devotional exercises. A big, hurly six footer, with brass buttons, cocked hat and long wand, stalked through the aisles and waved back the visitors. I took a seat in one of the low chairs facing, as I supposed, the most conspicuous place in church. He tapped me on the shoulder and turned around my chair, as much as to say, that view is good enough for you heathens. I gave him a low bow and child-like smile by showing my dissent to his judgment, and moved off to another part of the church to commune with what seemed to me best.

Porters or commissionaires are standing on the streets everywhere, especially at stations and hotels, dressed with white houses and brass bands around the arms with numbers. Mr. H. wanted to go to the bank to draw some funds, and was very near to it when he asked one of these men the direction. Two of them started with him to the bank, and as he was about to disappear in the door, both yelled out in broken English, "Commission, commission." Mr. H. said: "I did not ask you to go to the bank, I merely asked the direction."

He went in and got some funds, and as he came out, they repeated again "Commission!" He saw it was useless to talk to them, so he pulled out two pieces of Swiss money that he other natives refuse to take and gave each a piece. While they were examining them to ascertain the value of the queer coin, Mr. H. slid away.

It reminded me of the story of the man riding through a country that was full of wolves, and they made chase, while he would gain a little time by occasionally throwing out a piece of meat or a bundle of something for them to examine and fight over. They will stand at the hotel, and when a hack drives up, the driver will take gripsack off back, and these porters will snatch it up and run in and demand a fee. They continually play into each other's hands, and the best way is to have as little to do with them as possible.

D. FLINT.

Suggestions for Controlling our Rivers.

EDITORS PRESS:—In times of disastrous floods the public will be more open to conviction concerning the importance of doing what we can to control our rivers and prevent the vast damage done by their overflowing, particularly in washing away good soil, so that it is hoped the following suggestions and facts may tend to promote action toward these ends.

Having lived for several years only too near the Santa Clara river of the South, and having sustained considerable damage, both from the recent and other floods, the public importance of controlling this serious, continuous, and in great part needless waste of the resources of the country has been long impressed upon the writer.

It is quite within the truth to say that the loss along this one mountain torrent for only about ten miles, the region best known to your correspondent, has been 100 acres of good farming land within the past six years. This is written with but limited reports concerning our last flood. To estimate that this little county may have lost 500 acres of good farming land in this time is putting it too low. In the flood of '84 over 70 acres were washed away from one ranch alone, Taylor's on the Ventura river, the best part of it.

The public is interested in this waste by its loss of property to levy taxes upon for all time, as well as by the loss to the owner, a part of itself, many of whom are seriously crippled. To offset this loss there is no gain. If the loss to the State at large by this last flood runs into millions of dollars, as rumor already has it, surely the prevention of this for the future is of great public importance.

The plan to be brought forward here had been in successful operation several centuries, along the river Po in Northern Italy, before the great Goethe visited the country about 100 years ago. He was so struck by its great public importance, efficiency and simplicity that he gave an account of it in some of his writings and induced the Government of Weimar to try it on some of its small rivers.

The physical geography of the valley of the Po is very like that of our Sacramento and San Joaquin basin; both being liable to floods from sudden melting of mountain snows; a long extent of both valleys being very flat. For ages the loss to population and property in the valley of the Po had been enormous, until the following engineering plan was adopted: This consisted essentially in building solid immovable jetties into the current, where it tended to encroach, or to spread out too much, making the current swifter and deeper so that it washed along much loose material, stones, etc., that had formerly caused frequent changes of channel by obstructing old ones. Jetties being built along the whole course of the stream, on alternate sides as the current required them, it was also prevented from making these dangerous changes of channel and confined to the most suitable course at will. The eddies formed below each jetty catch and deposit the light particles, which in time amount to considerable soil, thus reclaiming flat land not needed for the water-course.

Our celebrated American engineer Eads followed practically the same plan in successfully deepening and keeping free one of the mouths of the Mississippi river, where he had to contend both with the enormous deposits brought down by the river, its current, as well as with the ocean tides.

If, now, the river Po has been successfully controlled for centuries, and the mighty Mississippi for years, surely all California rivers may be held within bounds, Sacramento and San Joaquin, as well as the mountain torrents of which there are so many.

For broad, sandy-headed streams like the Santa Clara of the South, constantly shifting its channel and making new distribution, its banks being almost entirely of rich farming or occasional sandy lands, the most suitable jetty that I have been able to think of would be one made by driving long, strong piles, such as the railroads use for bridges, at the proper places and angles to the stream, spiking strong planks to them from below the sand bed to as high a point as the water rises in floods. As the length of these jetties need seldom be over 25 or 30 feet, and as they might often be a quarter of a mile or more apart, the expense would not be too heavy to be borne, especially if all riparian owners, as well as the public, shared in it equitably. Here the value of reclaimed land would be considerable.

Of course the possibility of this being done at all depends upon its being given in charge to some public authority, whether of State or counties singly or jointly, so that some connected and sensible scheme could be followed; this to be determined by persons better acquainted with public affairs or engineering than the writer.

Surely some of our county money now wasted on plowing up the dirt roads once in awhile would be better employed in controlling the streams, and if the politicians would only allow us to enjoy as rational and profitable public control of our rivers, to lessen damages by floods, and of our forests, so closely associated with regulating the flow of the rainfall into the streams, to prevent floods, they would allow us to enjoy in this "free country" what some of the "effete monarchies of Europe" have had for generations.

Ventura Co., Dec., 1889.

Liberty Mining District, Siskiyou Co.

EDITORS PRESS:—There is probably no section in California which offers better inducements for extensive hydraulic placer mining, or any so long neglected, as Liberty mining district, Siskiyou county.

Mining capitalists seldom reach farther than Etna Mills, owing to the termination of the wagon-road at that place and to the inconveniences of traveling mile-back over the mountain trail, which continues on from Etna Mills across the Salmon range into the north fork of Salmon river.

There, there are many large deposits of gravel bars and high benches which are very rich, affording a productive field for hydraulic mining.

The facilities for hydraulic operations are all that can be desired. The water privileges are excellent. The river, having a natural descent of over 30 feet to the mile, makes sufficient water available for all necessary purposes.

One decided advantage this district possesses in regard to hydraulic mining is the liberty to dump the debris into the streams. There is not a spot along the entire course of the river from its sources to where it empties into the Klamath, and from there on to the coast, that is devoted to agriculture; thus no complaints ever arise to interrupt the constant running of the mines.

Owing to lack of capital, the "river bars" have been practically untouched with the exception of the rims and outlets which have been sluiced two or three times over with remunerative results. Good wages are being made by the miners working the gulches and shallow deposits along the river.

Quartz mining has taken a rapid stride during the past year, and the present outlook for the future is certainly encouraging. Many rich leads have been discovered, several of which, though worked on a small scale, are paying handsomely.

The present heavy snowfalls in the mountains are eagerly welcomed by the miners, who all expect a long and prosperous run next season.

FRANK H. HALL,

Etna Mills, Siskiyou Co., Cal.

Mining Accidents Prevented.

EDITORS PRESS:—In reviewing the late fearful, fatal catastrophe at the Utica mine, such might have been prevented had the worked-out ground been filled in between the timbers by debris, obtained if from no other available source, from the surface, by making apraises, passes, or chutes, and so shoot the waste material into the worked-out stopes or open spaces, thus compactly securing the ground. This would prevent any possible chance of collapse, if properly filled up to the weak surface portion of the mine. This system is made compulsory in the New Zealand mines, and should be carried out in all extensive mining operations, for it is always practicable. In New Zealand the mines are carefully inspected monthly, and oftener when there is a suspicion that danger may exist, by a competent mining engineer, who is a regular appointee of the Government in the capacity of mining inspector. An Act of the Legislature of this State should be passed, enforcing some such regulation, whereby the lives of the miners may be better secured, and accidents generally in mines reduced to the minimum. ARGUS.

A MINE MYSTERY.—While a party of miners were doing assessment work on what is known as the Black Sulphurets mine in Irish Mountain, Nev., for A. W. Gear, George Blythe, the leader of the party, while cleaning the debris from the above mine and after cleaning out about two feet of the accumulation, struck some bones, the first being the nether jaw-bone, and after a thorough search a full human skeleton was unearthed of a white man about six feet in height. This mine has not been worked for 15 or 20 years. The shaft was 26 feet deep, 6 feet long by 3 wide, and was dug in such a way that the dirt on the corpse could not have got there but by being thrown in by human agency. There is a story that that two men left Northern California some four years ago, one of whom had had his left thigh-bone broken. Afterward the other returned and said his partner had been killed in Irish Mountain.

AN ELECTRIC METER.—So general is becoming the use of electric lights that a meter to make an equitable charge to consumers for the amount of current actually utilized is a necessity. Repeated experiments in this direction have been made, but with indifferent success. The latest invention, and which expert judges pronounce a success, is that of Albert H. Minnaren, a brother-in-law of M. D. Law, formerly superintendent in this city of the Brush Electric Light Co. Hitherto those who need electric lights have been at the mercy of the company, but with the meter it is stated that the precise amount of current utilized is recorded—a great convenience to those who use either electric light or electric motors.

A DISPATCH from Brussels says that the mine-owners at Charleroi, where strikes are in progress, will make no concessions, thinking that the miners will not be able to hold out long. This action has greatly incensed the men, and the strike is assuming alarming proportions.

Trusts Declared Unlawful.

A little while ago the country was greatly agitated over the spread of anarchical socialism. The people stood aghast before the Haymarket outrage in Chicago, and the alio authorities hastened to stamp out the evil as they would the plague or a fire. But in the meantime there has been steadily and silently growing in our midst a more mischievous and alarming evil, one that threatens to strangle the leading industries of the land. It differs from Chicago anarchism in the agencies it uses. The poor, hear-soaked, fanatical anarchist throws bombs; the capitalistic anarchist proposes to so manipulate the law governing partnerships and corporations as to manufacture a vast shield to protect their schemes.

Such is the attitude of the so-called trusts or combines that have so alarmingly multiplied of late. The following indictment may be filed against the trusts:

1. They tend to build up monopolies and drive small capitalists out of business.
2. They destroy competition, the great multiplier of profit and equalizer of prices.
3. They amass fortunes at the expense of the community by increasing the price of commodities.
4. They build up an oligarchy which wields its own interests against that of the community, thereby endangering personal freedom and menacing the existence of democratic institutions.

It is a matter of gratification that our courts so far have been so prompt and pronounced in trying to arrest the spread of this evil. Judge Barrett of New York was the first to declare the Sugar Trust a "criminal enterprise," and his opinion has been ratified by the Supreme Court of that State. And now Judge W. T. Wallace of this city has dealt the trust-method of doing business another staggering blow. It will be remembered that on the 5th of November, 1888, the Attorney-General, G. A. Johnson, filed a complaint in the Superior Court of this county and city, alleging that the American Sugar Refinery of this city had violated its charter by joining the Sugar Trust, thereby disregarding the purposes for which it was incorporated by surrendering the management of its concern to a body of men known as the Sugar Refineries' Company, usually called the Sugar Trust. That said company is not a corporation, but is an unlawful combination and monopoly, acting in the restraint of trade, and that the American Sugar Refinery Company by amalgamating with the Sugar Trust had ceased to maintain its identity and exercise the functions for which it was created and had therefore forfeited its charter. These allegations Judge Wallace has in his decision ably and lucidly maintained. After stating a finding and a few established principles, his honor says:

"The stated purpose for which the 'American Sugar Refinery Company' became incorporated was the production—the competitive production—of sugar to supply human want; the business franchise granted was not for the sole benefit of the corporation or its stockholders, but, in a measure, for that of the public as well; the understood commercial policy underlying the grant, and to the observance of which the defendant, by accepting it, stood committed, looked to the promotion of trade in that commodity—the promotion of trade necessarily denotes the encouragement of rivalry in the business—competition on equal terms is conceded to be the life of trade, and to invite and promote that competition is the established policy of our laws. As competition tends to create trade, so monopoly tends to destroy it. This is the axiom which underlies the Constitution and general legislation of this State, and upon which the decisions of its courts have habitually, not to say uniformly, proceeded."

We quote this clause of the opinion because it has an ulterior bearing. Judge Wallace here clearly holds that a corporation is not created for the sole benefit of the incorporators, but for the welfare of the public as well, and that a monopoly injures trade by destroying competition in business. Now where shall we place the limit to this principle? Jay Gould controls the telegraph. A few railroad barons control transportation. A trust is a partnership of corporations, and such a combine is declared illegal and void; then why not be equally prompt and stern in limiting the powers of a corporation managed by one or more men? The only difference is that in one case we are under an oligarchy and the other under a despot.

But let us not shoot before we are out of the woods. Trusts are lucrative and will not die easily. The action of the North River Sugar Refinery Co. in commencing to wind up its affairs looks as if it had been compelled to go out of business by the force of Judge Barrett's decision, but the New York Times says "the scheme is an attempt to throw over the Sugar Trust as it stands the cloak of a Connecticut charter, in order that the trust may carry on its business as heretofore and in defiance of the courts of the State of New York." An effort may be made here to flank Judge Wallace's decision by a similar subterfuge. It is understood that an appeal will be taken to the Supreme Court, which, if it furnishes no hope, may at least give the protean business time enough to change its shape and color, and it may emerge in another form.

But why stop here? The whole family of trusts are illegal associations of capital, secret or semi-secret financial conspiracies, the object

of which is to artificially enhance the price of an article by monopolizing its manufacture and exercising a policy of brutal force and terror against all possible competition. We have the Standard Oil Trust, the Cotton-Seed Trust, the Rubber Trust, the Cattle Trust, Coal Trust, Gas Trust, and the Beef Combine, that monopolizes and controls the live-stock market throughout the Northwest and Middle States and levies a tax on every pound of beef, pork, mutton, lard, fish, and is steadily crowding the small traders who do not come under the wing of the vulture.

Arizona Minerals.

Wm. P. Blake in American Journal of Science.

The deposits of sulphate of soda of the valley of the Verde river, A. T., near the military post of Camp Verde, have long been known and extensively quarried by the ranchers of the region as a substitute for salt for cattle and horses. The occurrence of thenardite in Arizona was first made known to science by the late Prof. B. Silliman, in 1881, but he had not visited the locality and it has not been described. A recent visit to the place, and a somewhat hurried and superficial examination, enabled me, however, to collect and identify other allied species in association with the thenardite and a peculiar pseudomorph of carbonate of lime after glauberite.

The deposits of the thenardite and associated minerals are of considerable magnitude, covering several acres in extent, and reach a thickness of some 50 or 60 feet or more. They appear as a series of rounded hills with sides covered with a snow-white efflorescence and greenish-colored and yellow clay at the bottom and top, partially covering the saline beds from view.

These beds are doubtless remnants of a much more extended deposit which occupied a local lake-like depression, or basin, probably at the close of the great volcanic era during which most of the mountain valleys of Central Arizona were filled up by sediments and then overlaid by successive streams of lava. Sedimentary beds of volcanic origin remain throughout the Verde valley and its chief tributaries, and in the region of Camp Verde are deeply eroded, but rest on the uneven floor of ancient pre-Silurian slates standing on edge. High above the deposits of the valley, vertical cliffs of hard lava mark the edges of extended masses of *malpais*, under which all the other formations are hidden and protected. But the excavations in the banks of the sulphate of soda are insignificant in comparison with the magnitude of the beds, and have failed to show, conclusively, any bottom or top, or to reveal the true relations of the beds to the surrounding formations. Whether or not they are members of the volcanic series or of a later and more local origin is yet uncertain.

Thenardite.

This salt constitutes the bulk of the deposits. It is a coarsely crystalline mass, so compact and firm that it can be broken out only by drilling and blasting with powder. It varies in its purity. Some portions are more or less contaminated with a greenish-colored clay, but it is obtained also in large masses nearly colorless and transparent, with a slight yellowish tint, but seldom showing crystalline forms.

Mirabilite.

The hydrous sulphate of soda occurs in close association with the thenardite and appears to penetrate its mass in veins, but may prove to be an overlying bed. It is this species which, by its rapid efflorescence when exposed to the air, covers the whole deposit with a white powder and a thick crust through which the quarrymen must cut before they reach the solid banks of the anhydrous sulphate.

Halite.

Rock salt in beautifully transparent masses is sparingly disseminated in portions of the great beds. These crystalline masses, so far as observed, do not exceed an inch or two in thickness, and no evidence of the existence of any separate workable beds could be seen. It is irregularly disseminated in the sulphate. Some masses exhibit beautiful blue tints of color, like those seen in the salt of the Tyrol and of Stassfurt. Good fragments for optical and thermal experiments could be obtained here.

Glauberite.

This anhydrous sulphate of lime and soda is an interesting associate of the other species. It occurs chiefly near what appears to be the base of the deposits in a compact green clay. It is in clear, transparent, colorless crystals, generally in thin rhombs, lozenge-shaped, with the plain angles of 80° and 100°, and from half an inch to an inch or more broad and one-eighth to one quarter of an inch in thickness. The prismatic planes, *I, I*, are generally nearly obliterated, or are absent, through the great development of the hemi-octahedral planes—*L*, replacing the obtuse terminal edges. The terminal plane, *O*, is chiefly developed, and this, with the broad planes replacing the obtuse edges, gives to some of the crystals the appearance of rhombohedrons of the *minerals* series. The general habit of the crystals is similar to those from Westergeln, near Stassfurt, described by Zepharovich, with the predominating pyramid—*1*, occur also the pyra-

mids—*2*,—*3* and either—*4* or—*4-5*; traces of a pyramid on the acute edges have also been noted. There is evidence that the crystals vary greatly in size and in their habit in different parts of the deposits. They occur also in the midst of portions of the solid thenardite as inclusions, and in one instance a small crystal was found in the midst of a transparent mass of halite. Close inspection of the transparent tabular crystals from the green clay reveals the presence of crystalline cavities with fluid inclusions made evident by the movement of small bubbles. When heated, the decrepitation is violent.

Carbonate of Lime Pseudomorphs.

Where the lower bed containing the bulk of the glauberite crops out at the surface and has become oxidized and dried, the glauberite disappears and is replaced by carbonate of lime in an amorphous condition, but having the exact form of the glauberite crystals, whose matrix they have filled. These pseudomorphs are firm, compact and dense, but are without cleavage or interior crystalline structure. Color, cream yellow. They weather out in great numbers, and show that the glauberite once occurred in a great variety of sizes and forms of aggregation, in some places in rosettes and in others in crystals two or three inches long.

Bournonite in Arizona.

Bournonite occurs sparingly at the Boggs mine, Big Bug district, Yavapai county, Arizona Territory, associated with pyrite, zinc blende, galenite and copper pyrites. The crystals are brilliant and characteristic, with interesting modifications not yet studied and compared. This is believed to be the first announcement of the occurrence of this species in the United States. I am indebted to Fred E. Murray, E. q., superintendent of the mine, for specimens.

Railway Construction in 1889.

The *Railway Age* of December 27th publishes a tabulated statement by States of the railway construction (main lines only, not including sidings and additional tracks) in the United States for the year 1889. A recapitulation of the compilation gives the following summary by groups:

	Lines.	Miles.
New England and Eastern group.....	69	557
Central Northern group.....	46	784
Southern group.....	97	1,829
Southwestern group.....	37	792
Northwestern group.....	23	615
Pacific Coast group.....	39	674
Totals.....	316	5,231

The above shows a falling off compared with 1888 of 1800 miles, and that of 1887 of about 7800 miles. By an examination of the above, it will be seen that the list only embraces the line upon which track-laying was an accomplished fact, and therefore does not include the roads graded and not yet railed. The average mileage of each line completed was in 1889 only about 164 miles, against about 20 miles in 1888, which goes to show that the work last year was chiefly done on small extensions and branches. The *Age* in commenting on this fact says that the element of parallel railway building which caused the excessive and unhealthy activity of several previous years has been almost absent, and in nearly every case the extension or new road has been built because it was believed to be needed and not chiefly to get away business from a competitor.

The southern group of States shows the greatest degree of activity in railroad building, and a much larger proportion of development when area and population is taken into consideration. The Southwestern States and Territories have made considerable progress, but not one-half that they made in 1888. The Northwestern States have about held their own, while the Pacific Coast States have fallen off slightly, notwithstanding the large construction (398 miles) in Washington, owing to California's small mileage of 120 miles, against 600 miles in 1888.

The *Age* is authority for the statement that the addition of, say 5300 miles of new road during the year, means that, at the moderate average of \$20,000 per mile, the vast sum of \$106,000,000 has been invested in their construction and equipment, and that employment for the future has been furnished thereby to from 25,000 to 30,000 more men who will be required to carry on the operations of these lines, while thousands more will be kept busy in applying the various manufactured articles, the demand for which is increased by the addition of every new mile of railway.

THERE is nothing new in regard to the dreadful cave in the Utica mine. The bodies of the dead miners are still buried in the drift. Work is progressing in the direction of the dead, and ore is being extracted as usual. It may be a year before all the dead bodies will be reached.

The gas company of Jackson, Amador county, changed its process last year from coal to gasoline. At their annual meeting it was shown that the change did not work well, as the quality of the gas was inferior while the cost was fully equal to the old process.

THE hoisting works, machine and blacksmith-shops and sawmill of the Anchor mine, Park City, Utah, were destroyed by fire on Wednesday morning.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

GOLD DISCOVERY.—Livermore Herald, Jan. 11: Some years ago Wm. M. Mendenhall discovered what he considered to be copper ore on the hillside near the large spring at Agua de Vida, 10 miles southeast of this place. The ledge was unearthed in digging a trail from the cottages to the spring. Last summer Mr. Mendenhall decided to run a tunnel into the hill on the ledge. He did so, getting in about 30 feet. The ore he took out was seen by quite a number of people, nearly all of whom pronounced it copper. Recently he sent three samples down to Price's assay office, and this week he secured a return, which, to say the least, astonished him. Of the three samples of rock, that from a small vein assayed 84 cents in silver and \$3.10 in gold per ton; that from a ledge, 13 cents in silver and \$2.07 in gold; and the quartz, 45 cents in silver and \$9.30 in gold. This gives a return of valuation of the three specimens of \$3.94, \$2.20 and \$9.88 respectively per ton.

Amador.

SUTTER CREEK GOLD MINE.—Ledger, Jan. 11: The mill was brought to a standstill on Sunday, on account of the Amador Canal Co.'s flumes giving way. The mill resumed crushing last Thursday. Two shifts are now employed in the mine.

Calaveras.

QUARTZ AND GRAVEL.—Calaveras Prospect, Jan. 11: The persistent rains of the past month and a half have interfered very greatly with the active mining developments in this region of the State, but the amount of water now assured for the dry season will compensate for the present inconveniences to mining operations. The snow fall in the mountains is ample to furnish an abundant supply of water for the mills and mines. The past year has given mining in this county a great impetus, and with the present encouraging prospect we anticipate much mining enterprise in the future. In our immediate vicinity we hear that the Union mine will soon again commence operations. The London syndicate that is working this mine has not spared money for a thorough and complete test of the genuineness of this mine, and contrary to all reports "the holes in the ground" contain a fine body of ore. It is expected that all legal encumbrances will be lifted within a few days, and work will be resumed. Operations about Murphys and on the Stanislaus river are at a standstill for the present, owing to the weather. The Norfolk, Mr. F. B. Morse, superintendent, is making vigorous headway, despite snow and rain. At Robinson's Ferry, the new Huntington mill on the Calaveras mine is now in operation. The ore of this mine is said to be paying good returns. West Point has aspirations for the mining championship in the county. Prospecting in that section has been very active, and the indications for a revival of the mining boom are fair. Another district that is at present the center of attraction in mining circles is the historical and old-time Central Hill, famous in the 60's for its enormous yield of gold. The gravel mine lying dormant for the want of capital and enterprise will yet prove highly remunerative. The outlook in this district cannot but attract the attention of practical mining men, and the old gravel mines will be made to yield their glittering sand. Calaveras is just now a mining county of no mean importance. Its quartz mines are good and are being worked by moneyed men. Its gravel mines are undoubtedly very good, and there will soon be a new era in gravel mining. Its copper mines at Copperopolis are in the midst of great activity, and they have been re-opened "to stay." There is said to be sufficient ore on the ground to supply the smelting works for the next 10 years.

Inyo.

FISH SPRINGS.—Inyo Register, Jan. 9: This old mining district, which in early days gained a credit of \$225,000 gold output, is again coming to the front apparently to stay. The old McMurtry and Westerville mines on Fish Springs Hill, at present the property of John Welch and J. D. Mairs, are under bond to gentlemen representing a company organized in Chicago and Scotland, and present condition of negotiations indicates a speedy and important sale. J. N. Rose has a lease of the new ore concentrator which was put in the Maxim mill by McConnell & Davidson, and is getting good returns out of the hundreds of tons of rich tailings on the site of the old Fish Springs arastras. A number of new properties situated about five miles to the northward and four miles southwesterly from Big Pine are looming up as tangible producers. Henry Melone and C. F. Fuller, a team of veteran prospectors, are drifting on a 2-foot ledge at the bottom of a 100-foot shaft. A sample lot of 3 tons of the ore yielded \$65 per ton net, by arastra process. Doc. Graham and John Elliot have a ledge opened by a 130-foot tunnel, and 10 tons of \$60 ore on the dump. As the result of about four months' work, another party recently sold to A. K. Engley \$600 in gold. McCarty, the old stand-by arastra man of that country, lately bought a ledge from a Mexican, and got the purchase-money and \$100 more out of the ore already extracted. Harry Hearne keeps up his lick on the placer as of old. Ahern has tunnels 200 and 300 feet in length, running for gravel. O'Brien, Daley, Lavelle and others are working at different points. The region lies in the foothills on the east base of the Sierras, in a porphyritic and gold-bearing belt which extends from Mammoth to the Alabama mountains. It abounds with timber and water-power, and is accessible all the year round.

Mono.

RELOCATED.—Virginia Chronicle, Jan. 11: The Mocking Bird mining location in Homer district was relocated at midnight on Dec. 31st, the original owners having failed to perform the annual holding work. The Mocking Bird is said to be one of the most promising locations in the district. It is now known as the Wolverine.

Nevada.

PROSPECTING NEAR SPENCEVILLE.—Grass Valley Union, Jan. 11: There are a number of mineral-bearing veins in the vicinity of Spenceville, on what is known as the copper belt, but they contain other

mineral besides copper, as it is found that they prospect both in silver and gold, and it is for the latter that quite an amount of prospecting was done during the past season. The unfavorable weather for the past few months has mainly suspended such operations, but with the opening of spring, and the cessation of storms, it is contemplated to renew work actively, as it is considered that the prospects are encouraging. It is well known that the copper mine at Spenceville is worked at a profit, making regular shipments of cement copper, but if to this can be added gold and silver the Spenceville district may become prominent for its mineral wealth. Practical miners have confidence that good mines can be opened there.

AROUND GRASS VALLEY.—Union, Jan. 9: The freezing weather serves to interfere somewhat with the operations of the quartz-mining companies of the district, as it is an obstacle to amalgamation, and besides checks the flow of water. The Idaho mill has been frozen up three days and the North Star mill at present is only run at night-time on account of a scant water supply. The Idaho mill will start up again to-day. At the Empire mine there has been no interruption, and everything is reported to be going on as usual. At the Peabody mine nothing is being done more than to keep the pump going and holding the water. Arrangements have been made to get 20 inches of water from the town reservoir for power to keep the pump going. No underground work will be undertaken until milder weather enables full water-power to be obtained. The cold weather interferes also with milling at the Omaha. The water-power to run all the machinery is ample. Work is going right along at the Hartery, and the mine continues to show up well in high-grade ore. Out at the Maryland mine the snow is three feet in depth, and on Tuesday night the wind drifted the snow until it filled the trail, and the men going to and from their work found it difficult to get through. The work of running a crosscut in the Maryland ground is going on steadily.

Plumas.

NEW QUARTZ-MILL.—Greenville Bulletin, Jan. 8: We are informed that a new 10-stamp quartz-mill will be erected next summer on the Winona claim, situated about one-half of a mile southwest of Greenville, and that a company is now being formed for that purpose. The new mill is designed to crush ore not only from the Winona but from other quartz mines needing the use of a custom mill.

Shasta.

SQUAW CREEK.—Redding Free Press, Jan. 11: The Uncle Sam M. Co. has just completed the erection of a large air compressor at the mill. They are laying a 4-inch pipe to convey air from the mill to the tunnel which they are driving, a distance of three-quarters of a mile. Said tunnel is in a distance of 500 feet and it will require an additional 800 feet in order to reach the vein. The company expects to have the power drill running in a few weeks, when much better progress will be made.

FROM IGO.—Cor. Courier, Jan. 11: The continued heavy rains proved too much for the hoisting rig at the Crystal, and they have shut down till spring. At the Chicago they have the shaft timbered, and are running drifts at the 150 and 200-foot levels. Excellent ore is coming out of both levels, although the work is slow, owing to the difficulties of hoisting in bad weather. F. Gihney is developing a large ledge of promising quartz at the head of Spanish gulch. Work continues in the lower tunnel of J. P. Wright's sulphuretted ledge. The arastras are temporarily shut down, owing to the soaked condition of the mines, as well as depth of snow in the roads. Whit George and Doc Dunham have put up a power arastra on their Muletown ledge and will be ready to run in a few days. Not much placer mining is being done at present, the gulches having been pretty well cleaned out in former years.

LOWER SPRINGS.—Cor. Democrat, Jan. 8: The first day of January, 1890, appears to have been a very interesting day for prospectors in and about this district. Quite a number of quartz-seekers of Redding were feeding out this way for the purpose of jumping ledges; also to hunt up some rich deposits. Since Halley made his new find, there has been quite a number of inquisitive ones trying to hunt him up, but as yet his whereabouts cannot be discovered. One of the Hills from Redding has jumped the Keystone mine, formerly Mrs. Kempton's location. Bassett, from Redding, has located the old Hairgrave ledge, on the old Shasta road, a little above Salt creek. Some person has located the west extension of the Eastern Star. The Lucas property has been jumped by Ed Taylor. There are men employed working out assessments on the Van Bergin property on the Igo road. It is reported that parties are running a tunnel in the hill just above the old Gage place. Hall & Co., I believe, are carrying on the enterprise.

Sierra.

TUNNEL.—Mt. Messenger, Jan. 4: The new main tunnel of the Bald Mountain Ex. Co. is in over 3600 feet, and is being steadily pushed ahead for the channel.

Siskiyou.

SALMON RIVER.—Cor. Yreka Journal, Jan. 11: The mines of this section, both quartz and placer, are, and have been for some time past, closed down, owing to the scarcity of water. There is an abundance of snow to make water, but it will require a rain to start. Our miners are looking to a long and prosperous run, as never since 1859 has there been as much snow as there is this winter. The Gold Ball quartz mine is destined to equal, if not exceed, any mine that has ever been discovered in this section. Even the famous Black Bear, in its palmy days, pales into insignificance when compared with the Gold Ball. A winze has been sunk from the lowest tunnel a distance of 53 feet; at this depth the ledge is three feet thick, and carries plenty of free gold, in short, the deeper they sink, the bigger and richer the ledge appears. There is an abundance of ore in sight to keep the mill busy for several years. The 16-stamp mill was started up in November, and after a run of 25 days was compelled to shut down, as the supply of water gradually froze up. There is on hand at the mill at least 1200 tons of ore. Judge Hughes, John Grant and Joe Stevens have located and done considerable work on what is supposed to be the extension of the Gold Ball ledge. They have run two different tunnels, one of them 40 feet in length. In this tunnel they have uncovered a five-foot ledge of quartz, which prospects well. Messrs. Probasco, Stent, and H. Welker have discovered a ledge which will be remunerative. These men

have done considerable work to develop their mine. They have a tunnel run on the ledge, a distance of 80 feet. The ledge is from 12 to 18 inches in thickness, and carries free gold. It is estimated that their rock will yield at least \$20 to the ton.

NOVELTY.—Cor. Yreka Union, Jan. 9: The late storms have almost suspended quartz mining in this camp. Stopping had to be discontinued, on account of the water coming through from the surface. The Hansen, Gold Run and Know Nothing are the principal mines of the camp. They are all similarly situated, with development tunnels to tap the ledges at the depth of 300 feet from croppings, and open up levels 100 feet below present workings. The work is now being prosecuted by two shifts of miners, working night and day, and will be continued until the ledges are reached. Then I am in hopes to be able to report developments of permanent value, as much of the future of this camp depends on developments made in those levels. The last cleanup of the Know Nothing mill was a little over \$6000, with the usual expenses of about \$1500. Supt. Black, of the Know Nothing mine, is slowly recovering from injuries from a heavy fall three weeks ago and has been confined to his room continually since. The last cleanup of the Gold Run mill paid \$40 per ton, which gave the four partners a handsome dividend, and the Hansen mine did about the same. These three mines have paid handsomely in the past, and have much ore in sight in their stopes, enough to run them two years on dividend-paying ore. The placer miners have a good season in this district, and will undoubtedly take out more gold than has been taken out in the past three years. The prospects for southern Siskiyou are certainly flattering, and we predict great prosperity in the near future.

Trinity.

QUARTZ AT HAY FORK.—Journal, Jan. 11: Shephardson & Miller have been developing their ledge, which is situated about five miles from the town of Hay Fork, in a southerly direction, and they feel assured that now they have one of the finest prospects in the county. The ledge is about four feet wide and has well-defined walls. The ledge has been traced on the surface for 1000 feet. They have a shaft sunk to a depth of 75 feet, following the ledge the entire distance, and we are informed that the gold is as abundant at the bottom as at the top of the shaft. About one foot of the under side of the ledge prospects about \$20 to the ton, while the other three feet goes about \$300. Present indications point to a good quartz camp at Hay Fork in spite of the prophecy of many to the contrary.

EAST FORK.—From a private letter to a gentleman in town we learn that the mill on the Yellow-stone mine in East Fork district is running and that the mine is looking well.

Tuolumne.

GOLDEN GATE.—Sonora Democrat, Jan. 11: On the Golden Gate mine half the stamps are running dry and half wet—using on the latter a Frue and a Shaw concentrator. This will test the comparative merit of the dry crushing continuous Boss system of roasting and amalgamation and that of concentration and subsequent roasting. There has been received at the Bonanza mine an Ingersoll drill for work in sinking the shaft. It is the improved Ingersoll. The improvement consists in reducing and simplifying the number of parts. It substantially makes the machine a new one. Miners of experience who used the first form of the Ingersoll considered it cumbersome, liable to derangement. This has been overcome in the present improved form. It is a solidly constructed machine of few parts and light weight, and will do more effective work. It will be operated by the compressed air taken from the Richmann compressor belonging to the mine, and the latter is driven by water-power. This will greatly reduce the expense as well as hasten the work of development. Mr. G. F. Johnson of S. F. arrived in Sonora last week on mining business. He was unable to visit the mines he wished to examine in the interest of S. F. parties by reason of the heavy and unusual snowstorm of the past few days, but obtained important data as to certain mines that will lead to definite and early action, and to the industrial benefit of the county.

NEVADA.

Washoe District.

SIERRA NEVADA.—Virginia Chronicle, Jan. 11: On the 500 level at a point in the south drift from the east drift, 275 feet from the main east drift, an east drift is advanced 392 feet, the face continuing in porphyry showing streaks of clay.

UNION CON.—On the 1455 level in the north lateral drift 100 feet south of the north line of the mine, west crosscut No. 4 is advanced 112 feet, and now in porphyry and clay.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station a south drift is advanced 233 feet, from the end of the east crosscut, 316 feet from the shaft station, continuing in porphyry mixed with quartz showing value.

MEXICAN.—On the 1455 level from the north drift from west crosscut No. 1, 50 feet in from the lateral drift face, west crosscut No. 2 is advanced 122 feet in porphyry and clay.

CON. CALIFORNIA & VIRGINIA.—From the stopes on the 1300, 1435, 1500, 1600 and 1650 levels the ore yield during the past week has been considerably less than usual on account of the Eureka mill having been shut down the past few days, the accumulation of ice in the Carson river making it impossible to operate the mill. On the 1650 level, from points heretofore designated continue to extract ore. The north drift from the winze bottom, 60 feet below this level, is extended 505 feet, and are extracting ore from this point. During the week 1095 tons and 480 pounds of ore were shipped to the Morgan mill, 661 tons and 590 pounds to the Eureka mill. The average assay value of all the ore worked at these mills during the week, according to battery samples, was \$25.77. Shipped to San Francisco bullion valued at \$44,870.72.

BEST AND BELCHER.—On the 1000 level east crosscut No. 1 is extended 82 feet. Formation, hard porphyry. On the 1200 level, station has been repaired and north drift cleaned out and repaired a distance of 30 feet.

HALE AND NORCROSS.—Shipped to the Nevada mill during the week 937 tons of ore, showing an average value of \$19.49 per ton by pulp assays.

GOULD AND CURRY.—On the 200 level, the south-west drift has been extended 16 feet. Total length,

284 feet. Formation, porphyry and quartz, showing some value. On the 400 level the southwest drift has been extended 20 feet. Formation, quartz, showing some value.

NORTHWESTERN CON.—Shaft down 70 feet, the bottom in low-grade quartz.

WEST COMSTOCK.—Face of lower tunnel within 43 feet of the vein, which it will cut 400 feet below the surface croppings.

SAVAGE.—Shipped 445 tons of ore, battery sample assays showing an average value of \$22.37 per ton. Bullion on hand valued at \$5994 on January account.

CHOLLAR.—Crushed 420 tons of ore during the week, showing a pulp assay value of \$21.50 per ton. The 750 north lateral drift continues in low-grade quartz and 930 level north drift in quartz and porphyry.

POTOSI.—The 930 level east crosscut continues in quartz and porphyry. The 650 level east crosscut, No. 3, is in quartz.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—The west drift from the northwest drift is in quartz giving low assays.

IMPERIAL.—West crosscut No. 1 from the 500 level joint Confidence-Challenge drift is in quartz and porphyry. West crosscut No. 2 on the 300 level continues in quartz, showing bunches of ore.

YELLOW JACKET.—Daily ore shipments average 78 tons, battery samples showing an average assay value of \$21.75 per ton.

CONFIDENCE AND CHALLENGE.—The joint 300 level west crosscut continues in quartz and porphyry.

ALPHA.—The 600 north drift continues in low-grade quartz.

EXCHEQUER.—The 500 level east crosscut continues in quartz and porphyry.

WARD COMBINATION SHAFT.—The 1800 level east drift is advanced 169 feet.

OVERMAN.—Shipped 161 tons of ore to the Vivian mill during the week. Are preparing to stoop ore from the 1200 level.

NEW YORK CON.—Ore is showing in the lateral drifts from the raise above the 800 level.

EAST SIERRA NEVADA.—The 520 level south drift is out 604 feet.

CALEDONIA.—West crosscut No. 3 continues in porphyry.

CROWN POINT.—Shipped to the Mexican mill 764 tons of ore, showing a value of \$18.17 per ton by pulp assays.

BELCHER.—The 850 level east crosscut is in porphyry, showing streaks of quartz. The 600 level south drift is in porphyry. The 200 level east crosscut is in low-grade quartz.

SEG. BELCHER.—Ore is still showing in the 1200 level drift from the winze.

SILVER HILL.—Usual progress made in 160 and 260 level explorations.

JUSTICE.—Crushed 230 tons of ore, showing a value of \$23.75 per ton by battery sample assays.

UTAH.—On the 600 level the southeast drift is advanced 690 feet from the shaft station. Formation, hard porphyry.

OCCIDENTAL CON.—On the 400 level of fair quality is being extracted. On the 500 level, 70 feet south of No. 3 raise, an east crosscut is still showing bunches of high-grade ore. On the 550 level the line crosscuts are in quartz and porphyry.

NORTH OCCIDENTAL.—On the 550 level, joint east and west crosscuts at the south line of the mine are in porphyry and low-grade quartz.

Cherry Creek District.

ATTACHMENT.—White Pine News, Jan. 4: All the Merrimac company's operations in Cherry Creek have been suspended by the sheriff. An attachment for \$6000 has been levied on the property by the Union Iron Works of San Francisco. The miners will file their liens. Nothing more is likely to be done before spring, when the property will change hands. Cherry seems to be in a hard streak of luck.

Sylvania District.

SMELTER.—Virginia Enterprise, Jan. 10: A 40-ton smelter will be put up at the mines in Sylvania District early in the spring, and there are other evidences that a big business will be done there. A wagon-road is also being constructed to the mines.

Tuscarora District.

NEVADA QUEEN.—Times-Review, Jan. 10: North gangway from the 600-foot level of the North Belle Isle shaft has been advanced 28 feet. Rock hard.

NORTH BELLE ISLE.—The crosscut from the station, 300-foot level, extended 16 feet; ground is short and full of red slips.

BELLE ISLE.—The crosscut from the north gangway, 350-foot level, extended seven feet; rock very hard. The crosscut from the south drift, 250-foot level, continues without material change.

DEL MONTE.—North drift from east crosscut is in 17 feet, developing fine ore, assaying as high as \$136 per ton.

GRAND PRIZE.—Face of north crosscut from west drift on the 500 level advanced 11 feet, cutting numerous stringers of quartz.

NAVAJO.—No. 2 crosscut from south drift, 350-foot level, advanced 21 feet; face begins to show water and looks favorable. Upraise from south drift, 150-foot level, extended 9 feet, showing larger ledge of chloride ore. The mill cleanup has been completed.

NORTH COMMONWEALTH.—2d level: Joint crosscut has been advanced 12 feet. 3d level: Joint crosscut east extended 9 feet. Work has been suspended at this point, and drift started to open the ore cut 30 feet back from the face, which looks well. East crosscut from south drift extended 11 feet; face continues in low-grade ore, and shows some water.

COMMONWEALTH.—1st level: Winze from east crosscut has been connected with No. 14 chute, exposing a fine body of ore. South drift from No. 3 chute extended 16 feet, following the ore. East intermediate drift from No. 8 chute advanced 23 feet; face shows some low-grade ore. North drift from No. 5 chute is in 14 feet, two feet of good ore in the face. This drift is being pushed to the North Commonwealth line, 70 feet to go, 2d level: South stopes looking well as at any time heretofore. 3d level: South drift from No. 2 crosscut advanced 8 feet, exposing some good ore. Stopes just started at this point look well. 4th level: North gangway extended 11 feet; rock breaks very bad, causing slow progress to be made. The mill is running and doing good work. On account of having to get roaster bins filled, pans were not started until the 7th. The extreme cold and storms interfered great-

ly in starting, especially in repairing any brick work, but all is now running nicely. Battery pulp assay for the week, \$273 per ton; crude bullion on hand, \$8000. Seven hundred tons have been sent in the concentrator; crushed 550 tons; assay value, \$18 per ton; average assay of concentrates for the week, \$271.28 per ton.

ARIZONA.

CONGRESS.—Prescott *Courier*, Jan. 8: F. M. Murphy, superintendent of the Congress, has just come up from mill and mine and has the same news—both doing well. Quartz Mountain mill is running on rich gold ore from the company's mines. Now that Mr. Williams has come back, matters will be pushed on Big Bug and at the Senator. A Phoenix paper of recent date stated that there was a carload of unusually rich silver ore from Tip Top district, this county, at the store of J. Y. T. Smith, en route to the smelter at El Paso, Texas. Placer miners are sending in considerable gold.

ORE TO SHIP.—Mohave *Miner*, Jan. 11: There are between 150 and 200 tons of ore awaiting shipment from the various camps. Until the stormy weather subsides the ore teams will remain tied up. The crosscut tunnel being driven on the Little Boy mine is yet some distance from the ledge, and, owing to the nature of the ground, slow progress is being made. N. C. Amer recently had a shipment of high-grade ore from the Silver King mine worked at the sampler, Martin Jimenez and Juan Garcia have four men to work on the Goldback mine near Chloride. They are getting some good ore from the main shaft and will continue sinking for the present. T. Myers, lessee at the C. O. D. mine, had between 5 and 6 tons of ore worked at the sampler, which gave a result of 314 ounces silver per ton. Dan McKinnon and Geo. Koster are working the Altata mine with very good results. They have a carload of very good ore ready for sacking and shipping. The ore carries considerable copper and will be shipped to Argo for treatment. W. B. Campbell is working the ore from his gold mine in the Twins' wash, near Cerbat, by arastra, with fine results. The ore is very free, while the gold is coarse. The pay streak has grown to a width of 10 inches and much of the ore will be shipped. A whip has been erected at the main shaft of the Tuckhoe mine, Chloride. At last accounts they were down 90 feet, with 10 inches of ore that will average 350 ounces silver and 1½ ounces gold per ton. The new shaft at the Sunset mine has collapsed. The shaft had attained a depth of 95 feet, but it was sunk to a wash carrying much water during rainy weather, and the recent rains soaked through and caused the cave. Supt. Mackenzie has about 25 men employed at the Cupel mine and the ore body continues to grow both in quantity and quality.

GLOBE DISTRICT IN 1889.—*Silver Belt*, Jan. 4: The year 1889 was a fairly prosperous one for the mining industry of Globe district; the production of both silver and copper will show a considerable increase over that of the previous year, and the outlook is bright for a more successful season in 1890 than we have enjoyed for many years. A. L. Walker, superintendent of the Old Dominion Copper Co., has kindly furnished us with the figures representing the output of copper by his company during the past year, viz., 5,915,570 pounds, as against 4,600,000 pounds in 1888. This is certainly a fine showing for the Old Dominion Co., and the value of their mine, the Globe, is better appreciated by those who recently had access to the underground works, and ocular proof of the extensive ore bodies in sight, sufficient to supply the smelter with ore through the current year, and developments now in progress and contemplated will increase the ore supply and facilitate its extraction. With an active copper market, a liberal supply of coke on hand and the probability of an open winter, there is every reason to hope that the Old Dominion Copper Co. will enjoy a continuous and prosperous run.

BRITISH COLUMBIA.

AMERICAN MINING MACHINERY WANTED.—*Kamloops Sentinel*, Jan. 4: So much has been said and written one way and another, regarding the necessity of placing mining machinery on the free list, and the arguments advanced in favor thereof have been so potent, that little more remains to be said on the subject. However, the importance of the subject is our only excuse for referring to it in this number, and that it is important can easily be gleaned by a perusal of the reports from the different quartz-mining sections of the province as they appear in this issue. There can be no two opinions regarding the great drawbacks the mining industry of the province suffers on account of the heavy duty on mining machinery. The majority of the ores of British Columbia are of a refractory nature, and special machinery such as is not manufactured in the Dominion is required for their reduction. To purchase this machinery in a foreign country and then pay the enormous duty fixed by the Federal Government is imposing a double burden on the miner, a burden he is in many cases unable to shoulder, and consequently his claim must remain undeveloped. With the knowledge of this fact in their possession we cannot understand why any delay should be made by the Government in deciding on this important subject. But another phase of the question presents itself. Already the plant for two smelting works has been imported into the province and the duty thereon has been paid. Another company has purchased plant for a smelting works, which has remained in the hands of the manufacturer for about a year. The company has been led by certain matters under consideration to leave the plant where it is. And probably not among the least of these considerations was the desire to await the action of the Federal Government in placing such machinery on the free list. If so, and the Government should, before they decide to bring in the machinery, strike off the duty, then it would be no more than a simple matter of justice to refund to those companies which have imported plant and paid duty thereon, the amount so paid. The duty must come off mining machinery, and to be consistent the amount of duty already paid must be refunded.

COLORADO.

LOCATIONS.—*Georgetown Courier*, Jan. 9: The records show that during 1889 there were 473 mining claims located in Clear Creek county, or a pre-emption of some 2365 acres of mineral-bearing

lands. A location in 1889 doesn't mean what it did in 1869—then if a man discovered mineral indications, he put up his stake and his neighbors who could afford a shingle and pencil proceeded to locate Nos. 1, 2, 3, 4, etc., both west and east up to 20; now it means a survey, the sinking of a shaft 12 feet from the lowest rim and the disclosing of a well-defined crevice. It costs at least \$100 to do the simple location work and it is fair to assume that at least \$200 has been spent on each new location, so that in new work alone we have spent about \$100,000 in mining, on new ground.

THE GOLDEN FALCON.—The Falcon lode, Morris district, worked by George Mills & Co., has a body of gold ore, that, with a stamp-mill near by, could be made one of the largest producers in Clear Creek county. The value of the ore body has been determined by a mill-run of 30 tons, which averaged an ounce gold per ton.

THE COMET'S BIG VEIN.—The recent strike on the Comet mine is in the old east shaft at a depth of about 65 feet. The lessee, Mr. O'Mallie, has run a drift west from the shaft about 15 feet through a 12-foot vein lode material, indiscriminately mixed throughout with rich ore, the entire 12 feet being taken out and sorted.

LEADVILLE'S PROOUEURS.—*Denver Republican*, Jan. 9: The difficulties existing between the Marian Mining Co. and the lessees on the properties owned by this company, have been amicably adjusted. These difficulties having been so satisfactorily settled, the company assumed the entire control of all the ground belonging to them, and are now in full possession, and intend to work some of it themselves. Mr. Havens, acting for the Marian Co., has granted a new lease to the former lessees of the Devlin, another of the company's properties, for a long term, the lessees being Dr. Galloway, of our city, and a number of others. The strike in the Lucy B. Hussey having demonstrated the fact that in order to get at, develop and handle the ore from the new chute to advantage, a new shaft must be sunk, with the customary promptness of the management of that property, surveys were made and a contract let for the sinking of such a shaft, pending the reaching of the ore body, by which shaft all work, apart from keeping the old workings free of water, was abandoned, and all the force employed at the new shaft. The encountering of this chute by the Lucy B. Hussey is without doubt one of the most important events we have had to chronicle for a long time, and we shall anxiously await the reaching of the ore body by the new shaft and the subsequent development of the chute. Mr. George Kruger of the Tip Top mine returned to Leadville after an absence of some eight months in Europe, and the mine has now closed down for repairs to machinery, but will be started up again and work resumed on the entire ground as soon as the necessary repairs are effected. The shipment of ores from this mine has increased very materially lately, the average amount per day being something over 30 tons.

HUNTER PARK M. CO.—*Aspen Times*, Jan. 10: The Hunter Park M. Co. has got its shaft down 540 feet on the Montgomery group in Hunter park and has just let a contract for another 100 feet. The shaft is still in the blue lime, but it is expected that the present contract will carry it to or very near the contact. This company is amply supplied with funds for prospecting its property.

ON MILLER CREEK.—Gus Carlson and his partner have been sinking a shaft on the Snow Fall claim on Miller creek and have gone down about 40 feet.

THE EDISON.—Manager Murphy of the Edison reports that he has 100 tons of ore on the dump ready to ship. This will be sent down to make room for what is being broken in the mine. The property is certainly improving, although the ore is not now as high grade as it was a few days ago.

LOW-GRADE DRY ORES.—Mr. Charles Driver, manager of the Driver Public Sampling Works, has succeeded in securing a new schedule of prices for low-grade dry ores, which will enable the miner to ship 25 and 30-ounce ores at a profit. Many mines can now increase their output. This outlet for low-grade dry ores running from 25 to 40 ounces per ton, will materially increase the prosperity of the camp.

DAKOTA.

SYNDICATE SMELTER.—*Deadwood Pioneer*, Jan. 8: The plant was not blown in yesterday, as had been intended, but fires will probably be lighted today or to-morrow. The run, to be of two weeks' duration, will be on ores from several Bald Mountain and Ruby Basin mines.

REDUCTION WORKS.—Everything moves smoothly at Col. Carpenter's reduction works. Carpentering is nearly complete, and repairs to machinery are all but finished. The plant will probably be ready for business by the 20th of the month, and started for its initial run not later than February 1st.

IDAHO.

THE TIP-TOP MILL.—*Wood River Times*, Jan. 8: The new Huntington mill at the Tip-Top mine, on the Gold Belt, was started up for the first time Christmas Day. The mill was in first-class running order within 24 hours from the start, the only thing about it needing regulating being the tension of the belts. Ole Rorem was in Hailey last evening, and being asked how the mill was doing, replied: "We are grinding out gold night and day; two hundred dollars worth every 24 hours, and at an expense of only \$60 a day. We have 14 men at work and will keep the lick up all winter." Only one Huntington mill is in operation, as they were only wanting to make a test. There is plenty of ore in sight to keep half-a-dozen such mills in motion indefinitely.

SOFTER GROUND.—*Ketchum Keystone*, Jan. 11: It was reported a few days since that the parties running the Elkhorn tunnel had encountered soft ground and indications of quartz and iron. When it is remembered how slowly this important work has been going on for a long time, owing to the hardness of the formation encountered, the discovery of soft ground—and the consequent reason for expecting more—is regarded with no little satisfaction by those interested. In fact, the whole community is interested.

AN IMPORTANT SALE.—*Owyhee Avalanche*, Jan. 11: Capt. J. R. De Lamar of De Lamar, Idaho, is the purchaser of the two-thirds interest of Christian and Louis Wahl, in the Wilson, Chicago, Christian

Wahl, Louis Wahl, Phoebe Grace, Eva and Pharaoh mines, together with millsites, water-rights and tunnel-sites, situated near De Lamar, Owyhee Co. The price paid was \$500,000. Nearly every one is glad that the Captain purchased the property, because to him more than any one else is the development of the rich mining camp near De Lamar due. The property is well worth the price paid for it. The Captain will at once enlarge the mill, so we understand, to the end that he may reduce 100 tons of ore per day instead of 50.

LOWER CALIFORNIA.

NEW PLACERS.—*San Diegoan*, Jan. 4: As predicted, the rains are bringing new placer finds to light, and from now on rich strikes may be expected in the vicinity of Alamo, as well as in places not yet prospected. The strike reported last week at Mexican gulch, where two men took out \$200 in one day, brought many miners over from Alamo, and several discoveries were made. Three new ledges, named the Northern Belle, Las Dos Esmeraldas and Las Flores, have been denounced, all of them situated near the new discovery. The quartz is almost entirely decomposed, and some of the dirt yields \$2 to \$5 a pan. It is claimed that the quartz will run \$1500 per ton, but this must not be granted till it is proven. The new veins are about four feet wide and have every indication of holding. They run directly north and south. W. S. Kerr, who is interested in the Lane mill at Alamo, has ordered another mill of the same pattern (Wiswell) which will arrive from S. F. on the Newbern next month. It will be set up at Alamo.

INTERNATIONAL CO. WORK.—The International Co. is receiving bids for going ahead on the Princess, and also other mines, to do the work required by law on mines to which possession has been given, which is equivalent to sinking a shaft 50 feet on each mine. This will result in putting a good number of men to work who are now idle. Free milling ore will soon be taken out of the Princess at 70 feet for immediate milling, while the work will still proceed at the 100-foot level in this mine, where the ore consists of sulphurets of iron, rich in gold. Lane's mill is running in full blast and will soon be inclosed with a new building. A 25-pound rock, full of free gold, from La Flor mine, eight miles southeast of Alamo, owned by the Frenchmen, has been on exhibition at Alamo, and excited no little admiration.

AT REAL DEL CASTILLO.—At the Real del Castillo, work is still progressing on the Accidental tunnel, and it is expected that the ledge will soon be struck. A. Morales has bought a new pump which he will put up at the San Nicolas. The Chinese have been hindered by the rains from finishing the Masac flume, but it is being hurried to completion. Gold has been found in placer and quartz on Tanama mesa, near Tecate, about 70 miles northeast of Ensenada. The Florentina (placer) and Fortuna (quartz) have been denounced by Juan B. Morales and Jose Bustamante.

MONTANA.

MOUNTAIN VIEW ORE.—*Inter-Mountain*, Jan. 8: The worst experience thus far encountered at the Mountain View mine is the hauling of its ores to the smelter in Meaderville. The teams have now already all the roads so blocked with piles of ore from break-downs and the wagons sliding around that it has become almost impossible for them to navigate. Wagons have to be exclusively used, as sleds cannot be brought up into the concentrator, so wheels must be entirely resorted to as means of locomotion. This year will end all this trouble, as it is the intention of the company to build the branch from the Montana Central to the mines on the bill, the property of the company.

MAGNA CHARTA.—The drifts in the Magna Charta on the 300 and 400 are being put in condition to commence the stoping of ores at these points, more especially in the northeast. Ore has been taken all the way from the 700 to the surface and as much remains in sight as already abstracted, with considerable ground yet to prospect. The mill of the Alice company, of which the Magna Charta is a part, is pounding away steadily on ores taken out of both the Alice and Magna Charta mines and is doing no custom work at all. At the Blue Wing a few men are working, placing the mine in a position to produce ore, of which there is a known amount in sight without taking into consideration the ground that is not yet opened up. The Mountain Consolidated shaft is 550 feet in depth and ore is being produced from every level in the mine. There are no reports of new strikes to make, as for some time past it is known they have a body of ore, copper in character with a sprinkling of silver, second only to one mine in the camp. From reports circulated it is learned that it is the intention of the Colorado company to sink the Gignion to the 1000-foot level which is on an incline. A new pump was purchased yesterday for the Mountain Lion company, size 5½x3¼x7. The Acquisition has again been started up by an Armstrong hoist. There have always been favorable prospects in this mine, but the lessees do not seem to make it stick. It changes management often.

NEW MEXICO.

THE SAVAGE MINE SOLD.—*Kingston Shaft*, Jan. 8: We are glad to announce that the sale of the Savage mine and Savage fraction, which has hung fire some time, has at last been consummated. We are informed that the deed in escrow calls for \$65,000, and that considerable money was paid down. The sale was made on Dec. 20th, but was not completed until Jan. 1st. Horace McChristian was the lucky purchaser and we are informed that he is more than pleased with his bargain. The final payments will not be made for six months unless Mr. McChristian so desires, but it is presumed that he will make them much sooner, as the property is in reality able to bring that amount of money at any time. A force of men was placed at work upon the mine on the 3d inst., and the force will be increased as fast as room can be found to work them.

STEIN'S PASS.—*Lordsburg Liberal*, Jan. 11: Bob Williams was in from Stein's Pass yesterday. He reports the camp in a flourishing condition. Recent prospecting indicates that big values are to be found in the ledge to the south. Winters & Kimball are taking out plenty of high-grade ore. The

more work that is done in the Bachelor the better it looks. Sam Meeks writes that he has bonded his half interest in the Patchlock, Volunteer and Coon to John F. Miles. It is reported that the Volcano is about sold.

OREGON.

THE DOLLY VARDEN SOLD.—*Bedrock Democrat*, Jan. 8: The *Democrat* has been informed that the Dolly Varden mine in Sparta district, owned by Capt. E. M. White and others, has been sold to the Bowick Bros., representing a large English syndicate, the sale being consummated in Portland. The company purchasing this property are also the owners of the Monumental mine in Granite district, under the name of the Oregon Gold M. Co., Limited, of London, England. The Dolly Varden is said to be a good buy, and included in the purchase are several other mines adjacent to that property, forming a group of gold-bearing mines that will certainly yield a large output when properly equipped with suitable machinery. The sale of this property means the erection of a large milling plant and the result will be of great benefit to the whole district for miles around.

MINES OF GRANITE.—*Cor. Bedrock Democrat*, Jan. 8: Many new discoveries were made up in the Greenhorn mountains and all of that section give excellent promise of being a great bullion-producer in the near future, as soon as the proper milling facilities are supplied. Mr. Henry Cable has worked quite a number of batches of ore from the Columbia mine, adjoining the E. & E., and obtained in every instance from 95 to 97 per cent of the assay value by chlorination. Up at the head of Cracker and Fruit creeks some fine developments have been made during the past season, and you will hear some good news from Mr. Kinsey's property up there next year. At Cable Cove work is being pushed on the Miner claim, and there are at least 20 locations that will give a good account of themselves as soon as there are milling facilities. Over at the La Bellevue group of mines the concentrating works are turning out concentrates averaging \$300 per ton, faster than teams can be had to haul them to the railroad at Baker City. Here is the grandest mine in all this section of country. Two tunnels of 800 feet each show a compact body of ore from three to ten feet in width for the entire distance, and not an ounce of waste in any portion of it. The La Bellevue has paid from the grass roots down, and the ore is better in the lower tunnel than on top. The ore taken from the tunnels and winzes have paid for all the work done upon the mine, and have been shipped more than 1000 miles to the reduction works, and not a ton of ore has stopped. Is it not a good showing?

UTAH.

TINTIC DISTRICT.—*Salt Lake Tribune*, Jan. 12: When snow came it blocked everything. This has caused the Mammoth to lay off part of its force, because there was no storage room left for ore, all the bins and some of the old stopes being full.

CASTLE VALLEY COAL-FIELDS.—Union Pacific officials have been looking over the Castle Valley coal-fields with a view to opening up extensive mines there.

THE HORN SILVER.—At Frisco the Horn Silver is making its regular shipment of about 1000 tons of ore per month, such as net the company about \$30 per ton. During the past year this mine sent out a little over 12,000 tons of ore. They have in sight fully 18 months' work of similar ore in the mine, but it is not shipped separately, it being found best to mix it with the low-grade ore. The company employs about 100 men. During the past year, under the superintendence of Hon. P. T. Farnsworth, there was paid a dividend of \$50,000 and a surplus fund of \$20,000 was created, besides loaning \$200,000.

THE CACTUS CO.—The Cactus M. Co.'s property in Copper gulch, near Frisco, is being operated to some extent by the Comet Smelting Co.; also a French organization having a lease on the Cactus mines. After several months of inactivity they have put a few men at work.

COPPER CLAIMS.—The French company owning some copper claims a few miles northwest of Milford are working a small force there in developing their property.

IRON DEPOSITS AT TINTIC.—Parties at Provo owning valuable iron deposits in Tintic, which they have been developing for years, and have in vain tried to start a furnace and foundry to use this iron, have had their hopes brightened the past few days. Outside capital is seeking a location for a stove foundry, and learning of these iron mines have made a proposition for 20,000 tons of pig iron during this year. They are rustling for a local organization and funds to embark in making pig iron, and if successful will get a furnace in blast as soon as possible.

PARK NOTES.—*Record*, Jan. 11: Last Tuesday morning the Nevada-Northland leasers brought into the leasers' workings in the Mayflower No. 7, and what will be the outcome can only be conjectured. It is alleged by the Nevada-Northland people that the Mayflower have been working in and extracting ore from their ground, and to confirm this suspicion they drifted and then sank to connect with the Mayflower workings. When but a thin space of ground remained between, a small hole was broke through which gave an opening. Each side is determined and it looks like the fight for possession of the valuable and disputed ground will find its way into court.

CRESCENT'S UPPER WORKS LEASED.—*Messrs. Chas. H. Gitsch and Richard Campbell* have secured a five months' lease, dating from January 1st, and paying a royalty of one-sixth on the output, on all the Crescent Mining Co.'s property above the A'na tunnel.

GOOD NEWS FROM THE M'CUNE.—The hard formation which the McCune tunnel has lately gone through has proved to be the footwall of a big and well-defined ledge, so they have started work drifting on it.

ORE AND BULLION SHIPMENTS.—During the week the Mackintosh sampler received and forwarded 545,140 pounds of Ontario ore; 294,630 of Mayflower No. 7 leasers'; 272,470 of Daly; 78,750 of Alliance; 76,980 of Woodside, and 34,430 pounds of Nevada-Northland leasers' ore; total, 1,302,400 pounds. The Ontario bullion product for the week was 35 bars containing 21,247.86 fine ounces of silver.

MECHANICAL PROGRESS.

The Foundry.

The Requirement of Modern Times—The Apprentices System.

The use of machinery has been attempted in the foundry, but its successful application has been very limited, being confined to a comparatively few classes of castings; therefore the progress made has not been the result of improved machinery so much as the general attention to the details of the work and the greater knowledge of the principles of the foundry work by the majority of the men employed in it. To the foundrymen whose names are connected with the foundry literature of the present time is due a great deal of credit in considering the progress made in foundry work during the past decade; men who, in addition to the cares of the management of a foundry during the daytime, have taken upon themselves the extra labor of furnishing molders food for thought and new ideas for practice through the columns of mechanical papers.

That there is abundant room for greater progress in foundry work, those who are most intimately acquainted with the art of founding unhesitatingly admit. How is this progress to be brought about?

It is to a great extent in the hands of the foremen and proprietors of foundries, as well as the molders themselves.

The duty of the molder in helping onward the progress in foundry work is to improve himself in the intricacies of his trade by careful observation and study, while the duty of the proprietor and foreman is to make better molders, men who are better qualified to represent the trade in the mechanical world.

We undoubtedly have in our ranks some men who are just as good mechanics as can be found in the ranks of any trade, but we also have men who travel about the country under the name of molders who are only a disgrace to the trade. There is a remedy for this state of affairs, and the remedy for this evil rests entirely in the hands of the proprietors and foremen. I would suggest (after a careful study and a thorough knowledge of the requirements of the case) a change in the apprenticeship system in vogue in most foundries at present, in which every Tom, Dick or Harry gets a chance to "learn the trade," and after an apprenticeship of perhaps three years is launched upon the mechanical world as a molder. In nine cases out of ten, when such a molder (?) secures a job in a strange shop, his ability is soon gauged, and he is kept at work on the poorest class of work, as there is no money in him on good work. He soon tires of such a job and makes a change, only to find the same program prepared for him, and such is his life, traveling from one shop to another, but never getting a step higher in the knowledge of his trade. Of course there are exceptions to this rule, but it is safe to say I have outlined the result in a great majority of the apprenticeships of to-day.

We want and should have a more strict apprenticeship system, one that will insure the trade a good mechanic, and the apprentice a fair knowledge of his trade when he enters the mechanical world as a journeyman molder. I would suggest that each apprentice be indentured for at least five years, at a salary which will at least support him, yet be low enough to allow the employer to do his duty by the apprentice, without loss.—*J. P. Pero, in The Tradesman.*

A PNEUMATIC TIRE FOR BICYCLES.—A pneumatic tire for bicycles has been invented in Belfast, Ireland, which, if all that is claimed for it is true, must mark a new era in this method of recreation. The tire for a full roadster is about two and one-half inches in diameter, and is composed of an outer covering of rubber, graduated in thickness from about a quarter of an inch, where it touches the ground, and protected by canvas, where it is attached to the rim, which is very broad and nearly flat. Inside this outer covering is an inner tube, which contains the air. The air is pumped in with a foot-hall blower, and a patent air valve prevents its return. Vibration is practically annihilated. It is intercepted between the rim and the ground, and consequently the frame receives no jar except when an unusually large hole is encountered. A frame so protected should wear out two frames with solid tired wheels; and not only so, but riders will be able to use very much lighter frames without any danger of their collapsing. In a recent fifty-mile road championship, in the Phoenix Park, Dublin, one of the competitors rode a racing safety, fitted with "pneumatic" tires, and scaling only 23 pounds, and yet it passed through the ordeal—an ordeal trying even to the heaviest makes—without the slightest damage. Anti-vibration, luggage and camera-carriers and spring lamp brackets are quite unnecessary, and the complete absence of noise puts the finishing touch to the comfort and enjoyment of the rider.

A MACHINE MUCH NEEDED IN MILL WORK. A machine for cutting up round or flat iron and steel, and much needed in mill work, has been invented, says the *Rockville, Conn., Journal*. It cuts round iron or steel, from one-quarter to one-half inch, and flat up to quarter inch, as easy as one cuts a piece of card with pocket cutters. There is an opening for each size of round while a drawing shear cuts the flat. There are several unique movements and

points in connection with the machine which must be seen to be appreciated, especially the return of the blade after a cut has been made, and which is made without any springs to offer any resistance to the cutting motion. A great advantage and saving of time results from the finished manner in which the work is left after the cutting.

CUT VS CAST GEARS.—Cut gears run smoother than cast gears, and gears that have their teeth set on a skew run more quietly than those on square across, but there is a form of a tooth on the slant known as the herring bone, that no one ever attempted to cut on a milling machine until a gear-maker discovered that they could be cast in halves and bolted together after the teeth had been snagged on a gear-cutter. It was claimed that the strength by braising against each other was not impaired if the wheel was driven in the right direction, and where strength alone is not the vital point the space on one side can be made to match with the teeth on the other, and in this way get the best condition for a smooth-working gear.

THE COMPOUND ENGINE.—To what an extent facts gathered from experience will overturn theory is well seen in the instance of the compound engine. It is but a few years ago that the utility of the compound engine in mills was opposed by most of the engineers in this country. Now it looks as if in a few years the simple condensing engine for large power would be a curiosity. And as the practice of compounding comes to be better understood, it is extending to small sizes. Higher steam pressures and compounding are having an important influence in reducing the cost of motive-power.

THE MANUFACTURE OF SPIKES.—Experiments of an encouraging character have been made in the manufacture of spikes, with a view to making a finished article by rolling the bar so that its width shall be the length of the spike, and in such shapes that the spikes may be cut from it with shears, similarly as a nail is made, except that the head is made in the rolling process. In tests made by running through some steel nails that had been slowly heated for 2½ hours, the result showed that with some change in the working mechanism the operation was entirely practicable.

LARGEST LOCOMOTIVE EVER BUILT.—The largest locomotive ever built has been ordered by the St. Gothard Railway Company of J. A. Maffei, of Munich. It will be a large double compound tender-locomotive on the Mallet system. The service weight will be 85 tons, and the engine will run on six axles coupled in two motor groups. In Stephenson's time the railway locomotive engines weighed only about seven tons. Now the heaviest type of the ordinary express engine weighs about 50 tons.

ALUMINUM IN THE MANUFACTURE OF SHIP PLATE.—Aluminum is developing its value in another field of usefulness—the manufacture of ship plate. A plate in which ten per cent of it is used possesses great strength, will take a high polish, and is absolutely proof against the corroding action of sea-water and the adherence of barnacles, sea grass, and other similar matter. Gun-barrels made of this alloy will not rust.

A NEW FASHIONING MACHINE.—A successful experiment in the operation of a ponderous 14-ton machine, built to fashion steel railroad ties, was made at Pittsburgh last week. The machine was set in motion at the mills of Carnegie, Phipps & Co., and from a three-quarters of an inch steel plate finished ties were turned out at the rate of 80 per hour.

THE NEW FORM OF SCREW, which has recently been brought to notice, as a half nail and half screw, involves in its use two blows of the hammer and two turns with a screw-driver. Its holding power in white pine is said to be 332 pounds against 298 pounds, the holding power of a screw of the same size made after the usual manner.

THE ROTARY SNOW FLOW, introduced upon the railroad this winter, works admirably. It goes through the deepest snow which has fallen this winter without any trouble whatever, dashing the snow through the hopper 150 feet away from the track.

A STEEL RAILROAD TIE.—Gen. Lew Wallace, well known as the author of "Ben Hur," has invented a railroad cross-tie, which, some railroad experts think, may be of more pecuniary benefit to him than even his famous work of fiction.

THE FUTURE MAN-OF-WAR.—The Italian Admiral Albini thinks that the future man-of-war will have double screws and a helm at each end, so that in battle it need waste no time in turning around. Its sides will be unarmored.

THE NEW RAILROAD LAW.—A requirement in the proposed railroad law calls for the payment of mileage on all cars belonging to private companies or individuals—a very reasonable requirement.

PIO IRON.—It will be news to many that the consumption of pig iron in this country is greater than in Great Britain, but it was in 1886 and 1887, and is again this year.

SCIENTIFIC PROGRESS.

Sulphur in Refining Sugar.

A good deal of sulphur is used in the manufacture of sugar, and in no country in the world is it employed to a greater extent than in Louisiana, says the *Grocers' Criterion*. Sulphur is applied to cane-juice in the form of gas, and it makes the product, both of sugar and molasses, lighter and brighter in appearance, planters claiming that it enhances the value from three to five cents on molasses, and that the sugar has a brighter color and requires less washing to produce the same tone. The method generally adopted is to burn sulphur in a small brick oven. The fumes of the sulphur are carried by a pipe into a harrel of water, and the sulphurous gas coming in contact with the water is cleaned from sulphuric acid. The fumes thus purified pass from the harrel by means of a pipe into the sulphurizing-chamber which is constructed of wood in such a manner that the juice is constantly coming in and going out, and an arrangement is made so that the juice will fall in the form of rain or spray, the effect being to bleach out the coloring matter contained in the juice.

Some manufacturers claim that a great deal of the sugar is destroyed by coming in contact with the sulphuric gas which contains a considerable quantity of sulphurous acid, and that by a little carelessness in applying this acid to the cane-juice thousands of dollars a year have been lost in the larger manufacturing. The question has been raised and discussed largely by scientists and pure-food men as to whether the sulphur affected the sugar so as to make it injurious to health, some claiming that it does and some that it does not. Where so many doctors disagree, it is extremely difficult to determine whether bleached sugar is harmful or not. The existence of sulphurous acid in molasses is what causes it so often to corrode metal vessels of various kinds with which it is brought in contact. It may be taken for granted that any substance that would corrode an iron pan or a copper kettle is hardly fit for human consumption.

SEED OF FISHES.—The speed of fishes is almost an unknown quantity, it being, as Prof. G. Brown Goode says, very difficult to measure. If, says the professor, you could get a fish and put it in a trough of water 1000 feet long and start it at one end and make it swim to the other without stopping, the information could be easily obtained; but fish are unintelligent and will not do this. Estimates of the speed of fish are consequently only approximated, and more or less founded upon guessing. One can tell, however, at a glance whether a fish is built for speed or not. A fast fish looks trim and pointed like a yacht. Its head is conical in shape; its fins fit down close to its body, like a knife-blade into its handle. Fish with large heads, bigger than their bodies, and with short, stubby fins, are built for slow motion. The predatory fishes, those that live on prey, are the fastest swimmers. The food fishes are, as a general thing, the slowest, and consequently are easily captured. Their loss is recompensed, however, by the natural law which makes them very prolific in reproduction. Dolphins have been known to swim around an ocean steamer, and it is quite safe to say that their speed is 20 miles an hour; but it may be twice as much. The bonito is a fast-swimming fish, but just what its speed is, is not known. The head of the goose fish is very large, 20 times as big as its body. It moves about very little, and swims at the bottom of the ocean. The Spanish mackerel is one of the fastest food fishes. Its body is cone-shaped, and is as smooth as burnished metal. Its speed is as matchless as that of the dolphin, and in motion, it cuts the water like a yacht.

THE PRESSURE EXERTED BY SEEDS.—Mr. Grehant has recently made known the results of some experiments undertaken for the purpose of comparing the pressures exerted by seeds placed in a closed vessel in a current of water. The apparatus used consisted of a small Papin digester of cast iron, having a capacity of 45 cubic inches, and provided with a tight-fitting cover held in place with screws and nuts. The vessel was filled with seeds up to the middle, then there was introduced in the center a rubber bag one inch in diameter filled with mercury, into which entered a glass tube at the top. This tube, which passed through the cover, served as a compressed air gauge, while a brass tube extending to the bottom also traversed the cover and served to introduce the water that had to be removed. Finally the vessel was filled with seeds and closed. With lupin seeds, Mr. Grehant found that the pressure rose to 15 atmospheres. Upon opening the apparatus he found the seeds very strongly compressed against each other, there being not the least interval between the flattened surfaces. When lentils were placed under the same conditions, the pressure did not exceed eight atmospheres.

THE PHONOGRAPH'S RIVAL.—M. Leon Esquima, a Mexican, it is stated, has perfected a marvelous invention in electricity and photography. By speaking in a photophone transmitter, which consists of a highly polished diaphragm reflecting a ray of light, this ray of light is set into vibrations and a photograph is made of it on a traveling band of sensitized

paper. Now comes the wonderful part. If the image of the photographic tracing is projected by means of an electric arc or oxyhydrogen light upon a selenium receiver, the original speech is then heard. It is evident that there is no limit to the development of this peculiar combination of methods. This is very important, if true.—*Popular Science Monthly.*

A LIGHT THAT BRINGS OUT ALL THE COLORS OF A PICTURE HARMONIOUSLY.—Thomas A. Edison's latest achievement is the invention of a light by which pictures may be seen at night with nearly all the advantage of daylight. Electric lights have heretofore thrown either too brilliant a light or too yellow a light. Edison has secured a perfect light for pictures by placing at the back of the bulbs in his system of lighting a lead piece covering half of the bulb and fitting it closely. Inside of the bulb is a coating of silver. The yellow of the light and the silver reflection make a light that brings out all the colors in a picture harmoniously. It was first used in the illumination of the Angelus in the Barye collection.

PAINTING IN SAND.—A PRETTY NOVELTY.—Parisians have been entertained by a remarkable artist who displays wonderful skill in her peculiar form of painting. With plates of various-colored sand before her, she takes the sand in her right hand and causes it to fall in beautiful designs upon a table. A bunch of grapes is pictured with violet sand, a leaf with green sand, the stalk with brown sand and relief and shadows by other sands, when the work is brushed away, and a bouquet of roses and other objects are represented with the same dexterity and delicacy. Lines are drawn by the stream of sand as distinct as though made with an artist's brush.

A NEW WHITE PITCH FOR SHIPBUILDERS has been introduced, which, it is said, supercedes the present laborious, expensive and inefficient method of forming white deck seams by working putty into the seams with a knife. The peculiarity of the white pitch is that it is the only material hitherto introduced of a white color that can be run into deck seams in a hot state like ordinary pitch. The material is especially suitable for hot climates, as it will stand a sun heat which would cause ordinary pitch to melt out of the seams.

THE LOTUS AS A TANK-PURIFIER.—*Indian Engineering* states that a large basket of the roots of the lotus has been received by the municipality of Bangalore from Tanjore, and is now being planted out in the beds of the tanks in the station. This aquatic plant is one of the best water-purifiers known. It rapidly oxygenates the water, and ridding it of its dead organic matter, brings it into a healthy condition. The presence of such like aquatic plants in reservoirs is said to diminish evaporation.

SCIENCE PRIMERS.—The American Society of Naturalists, at their recent meeting in New York, appointed a committee to prepare a plan for the publication of a series of science primers. A resolution was also adopted recommending to colleges the addition of natural science as a requirement for admission, and asking the colleges to make a change, even if it necessitated a reduction in the amount of classical knowledge required.

PRESERVATION OF MILK BY ELECTRICITY.—M. Maissonhaute, says the *Bulletin International de l'Electricite*, having noticed that the passage of a current of electricity through milk retarded the formation of cream, made a series of experiments to see whether milk could be kept fresh in this manner. The result of these experiments is a patent for the preservation of milk by means of either static or current electricity.

DRY OXYGEN.—The scientific world seems to be very much surprised at the late discovery of Mr. Bereton Baker of Dulwich College, about oxygen. That gas, which is known as the great agent of combustion, loses its character when dried. It becomes inert. Even charcoal will not burn in it when heated to redness, nor phosphorus become luminous. As yet there is no explanation.

ALUMINUM CASTING.—A gentleman in Philadelphia has been making some very successful experiments in casting aluminum. He has ascertained that it is possible to obtain exceedingly good results by the use of brass or iron molds, faced with plumbago.

NITROGEN AND PLANT COLOR.—A French chemist believes himself able to tell whether soil is deficient in phosphorus, potash or nitrogen by the shade of green of the vegetation. The leaves become yellowish when nitrogen is lacking.

FROZEN SIXTY FEET DEEP.—Siberia is said to have a spot of ground about 30 miles square that has not thawed out for a hundred years, and is frozen to a depth of 60 feet.

COCOA BUTTER.—German chemists have discovered in the cocoanut a fatty substitute for butter, and this new product has begun to be manufactured on a large scale.

GOOD HEALTH.

"La Grippe."

The Russian influenza, "la grippe," or by whatever name it may be known, is nothing new. Indeed, it is very ancient, for it dates back as far as 1510. Dr. John R. Hamilton of New York, a well-known and accepted authority on all matters pertaining to the laws of health, and on the subject of "la grippe," says the disease has made periodical visitations during the last few hundred years. It spares no part of the world in its pilgrimages.

The earliest recorded epidemic of influenza is that of 1510. There were 20 visitations of the disease, which is also known as epidemic catarrh, between 1510 and 1837. The disease does not confine itself to men, but frequently affects the lower animals.

A complete history of the disease was published under medical authority in England in 1852. Among the articles in that work was one by Dr. John Warren of Boston, written in 1790, from which it appears that influenza, then well known in Europe, invaded the whole of the United States in the course of the autumn of 1789.

What It Is.

Dr. Albert Robin of the Paris Académie de Médecine says: "This disease is known as 'influenza,' or more commonly in French, as 'la grippe.' Unquestionably the epidemic will continue to spread—how far it is impossible to say—but there is no occasion for serious alarm. An ordinary case of influenza has nothing more to be dreaded than a severe cold of a week's duration.

Its Symptoms Are Unmistakable.

"Headache, pains in the eyes, soreness all over the body, as if one had been beaten, loss of appetite, a feverish condition, and a general sense of lassitude and discomfort. These general symptoms are apt to be followed by various local troubles, such as a bronchial attack, a cold in the head, sore throat, diarrhoea, and sometimes by pleurisy or pneumonia.

"The only real danger is presented in the last two cases, which can usually be guarded against by proper care. From three to eight days is the average duration of the disease proper, but its effects upon the system are comparatively severe so that several weeks more are often needed for a full convalescence." Persons who may be seriously ill only a week will often require from three weeks to a month to attain once more their normal condition.

Remedies Proposed.

The New York Sun proposes the following remedies, presumably after competent medical advice:

On the first appearance of the characteristic symptoms a full dose of quinine should be taken. In an adult, without any constitutional peculiarity unfavorable to the action of quinine, the first dose should be 20 grains. After this, ten grains may be taken three times a day, unless there should be intense ringing in the ears, with some impairment of hearing. An attempt should also be made to destroy the microbe by local applications.

A gargle of one drachm of borax, one drachm of salicylic acid, one fluid ounce of glycerine and seven ounces of rose-water should be used three or four times in the day. At night, ten grains of Dover's powder, with hot drinks and abundant bedclothing to promote perspiration, would be useful.

Those who prefer simpler means of treatment will find the adoption of a diet of fruit, farinaceous foods and cereals of great value. Lemons should be used freely, and the nasal passages cleansed often with common salt and water. Inhalations of carbolic acid and iodine will aid in destroying the germs. In most cases the latter treatment will probably be sufficient, and a resolute exercise of the will-power will not come amiss in preventing the disease from acquiring the mastery.

Nothing to Do With the Cholera.

Dr. Robin, above quoted, says: "The theory has been advanced that influenza is the forerunner of cholera, but I regard that as pure nonsense. It is true that several times in the present century an influenza epidemic has been closely followed by a visitation of cholera. It is also true that several times in the same century there has been an epidemic of influenza with no cholera following, just as there have been epidemics of cholera with no influenza preceding. The fact is that the two diseases are so utterly dissimilar as to make any such sequence all but impossible, and any occasional instances of their simultaneous appearance must be regarded as a mere coincidence with no deeper significance." It is supposed to originate from a microbe. The microbe of consumption, cholera and even of whooping cough has been discovered, and the Paris savants are already working to discover the influenza microbe.

One Can Catch It In the Air.

By mere breathing, the microbes can be taken into the system, so that when it starts it soon has the whole population of a city sniffling and sneezing. Nearly all the civilized world, just at this time, is sneezing as they never collected before.

Imagination Has Much to Do With the Disease.

The imagination, in this as in many other epidemics, is apt to aggravate the disease.

Don't be afraid of it; but when you are attacked, just give way to it and put yourself under the care of a good physician and you will soon be all right. The sensational reports given in the daily papers do much injury in this direction. A prominent physician of Washington says: "I think that in 99 cases out of 100 there is nothing else the matter with the people who think they have the epidemic than a very natural and ordinary cold in the head. There is nothing unusual about such colds at this time of the year. In fact, I do not know that I ever saw a year go by when two-thirds of my friends did not, at this season, suffer from such a cold. But the moment the newspapers call attention to the fact that there is a new disease prevalent in some corner of the world every man who has the sniffles begins to believe that he has the symptoms of the epidemic. Of course, there is undoubtedly some truth in the existence of this peculiar disease. The reports from the other half of the world prove that; but what I contend is that in a vast majority of cases there is nothing extraordinary the matter, but that the sufferers imagine that their cases correspond exactly with the genuine cases of la grippe. It all comes from the attention which is called to the epidemic in the newspapers. I would venture to say that where there is one genuine case of influenza, there are 99 imitations."

ELECTRICITY.

The Continuous vs. Alternating Currents.

The principals in the incandescent-lighting field have both had their say in the *North American Review*. Mr. Westinghouse having answered Edison in the current number. Edison's argument appears to be dictated by self-interest, and its motive is stated in his own words: "My personal desire would be to prohibit entirely the use of alternating currents." Westinghouse contends that the alternating current system, which is that upon which the incandescent lamps in most cities are run, is the safest, because the converter, which is placed on the premises of every consumer, is an impassable barrier through which none of the high-tension street currents can pass, and which absolutely protects the consumer against injury or fire. The only danger which can result from the use of the alternating-current system is from the wires in the streets carrying the high-tension currents, and this danger Mr. Westinghouse believes can be entirely removed by placing the wires under ground. Mr. Westinghouse expresses himself as being a firm believer in the underground system. He contends that the experience of Chicago and Philadelphia in the use of underground cables for high-tension currents, to say nothing of the large number of cables laid underground in Rome, Berlin, Milan and in other cities, indicates that the success of properly constructed underground systems, whether for currents of high or low tension, has been established beyond question.

Whatever may be the result of this controversy, it is becoming more and more evident that something will have to be done regarding wires carrying electricity at high tension. Whether it is practical or not to obtain a proper insulation of the wires underground, their presence overhead, as now prepared and maintained, is clearly a source of too great danger to life to allow of their permanent continuance. But instead of such violent action as has been taken in New York for their abatement, would it not be much wiser to look around for some improved and more safe method of placement for the wires? The rapid improvements that are being made in handling the electric current, and the great demand for its use, would seem to point to some such conservative policy.

The telegraph has just, at this present writing, announced that a method of personal insulation has been devised in Erie, Penn., by which a person with a moist hand, and standing upon moist ground, can safely grasp an uninsulated wire in his naked hand, through which is passing a current of over 500 volts. If such a thing is possible, we ought certainly to look confidently for some device by which that current can be safely carried from point to point, either above or under ground. In the present earnest need for a way, surely some genius will soon give to the world a method by which electricity for light may be distributed as safely as gas.

ELECTRIC MICROMETER.—Practical electricity says that a machine has recently been invented by Mr. Bain of Chicago, Ill., which is of practical value to shoe manufacturers. The machine is an electric micrometer which can cut pieces of leather according to thickness and distribute them in separate receptacles. It separates taps which vary in thickness as little as one-thousandth of an inch. It has a capacity of 5000 taps per hour. Besides sorting the pieces of leather, the machine automatically records the number placed in each receptacle. When the machine is in operation, all that is required of the attendant is to put the taps in a trough-like box. A follower is then adjusted behind the taps which keeps them in an upright position and maintains a constant pressure as they are fed from the trough into two abutting fingers. The taps are

in return fed from the trough into micrometer fingers, which pass successively into position. The fingers, which are fed around by a ratchet movement, pause a short time over the receptacles for taps. When a micrometer finger reaches one of these bins in which the tap that it holds should be dropped, the inner extension of the finger touches an electric contact, and the tap will fall from the jaws. The operation of the finger is made to actuate a counter which indicates the number of taps in every receptacle. The apparatus is furnished with current by a small dynamo especially constructed for the purpose. The machine is simple and accurate, and is not liable to get out of order. The whole appliance is the invention of Mr. Bain of Chicago.

A POINT OF SUPERIORITY OF THE ELECTRIC CAR.—An accident in New York a few days ago when a horse car became unmanageable through the failure of a brake, brings to the front again one of the chief points of superiority of the electric car, namely, the possibility of an almost instant reversal. If the brake of an electric car fails, the current can be reversed and the car brought to a standstill or even started in an opposite direction, quicker than by any other method used on street railways, and this is unquestionably one of the strongest reasons why the electric car is best suited to run at a high rate of speed in ordinary city or suburban streets.—*Boston Journal of Commerce.*

AN ELECTRICAL TOOTH EXTRACTOR.—An electrical instrument has been invented which is designed to remove the pain incidental to the extraction of teeth. It consists of adjustable prongs carrying buttons and connected with an electrical battery. The buttons are placed on the face over the nerves leading from the teeth to the brain, and a circuit is established the moment the extracting instrument touches the tooth to be removed.

PROGRESS OF ELECTRIC WELDING.—It is reported that the Thomson Electric Welding Co. will erect a factory at East Chattanooga, Tenn., at a cost of \$1,000,000.

ENGINEERING NOTES.

A CANAL ACROSS ITALY.—Signor Vittorino Bocca, the eminent Italian engineer, proposes to join the Tyrrhenian sea with the Adriatic by a ship canal, which crossing the peninsula from Montalto di Castro, province of Rome, in a northeasterly direction, would reach the east coast of Fano. The canal is to have a length of 124 miles, to be 263 feet wide, and to have a depth of 40 feet. At each end of the canal a port is to be constructed, having an area of 129 acres, and four entrances each of 74 acres. The cost of construction is estimated at £25,000,000. This is a highly important work in more senses than one. It is to be made a national enterprise. The canal, with its great width and depth, would be navigable for the largest ironclads. It is also urged that the internal trade of Italy would gain greatly by the canal, and that the provinces of Rome, Grosseto, Siena, Arezzo, Perugia, Pessaro and Ancona would obtain through it direct water communication. The drainage and improvement of the marshy districts through which the canal would pass would be facilitated, and it is further stated that by the reclamation of the lakes of Bolsena, Chiusi and Montepulciano, and the Trasimene Lake, an area of 170 square miles would be rendered fit for cultivation. The cost of constructing the canal is estimated at \$125,000,000.

TO BE GIVEN A PRACTICAL TRIAL.—A practical trial is about to be given to the project for a railway for heavy ships. There is a narrow neck of land, 17 miles wide, called Chignecto Isthmus, which connects the two provinces of Nova Scotia and New Brunswick. It has long been considered a matter of great commercial importance that either a ship canal or a ship railway should be constructed across this isthmus. Such a work would save a voyage of 500 miles through rough and stormy waters to the large and growing commerce which is carried on between the St. Lawrence river and ports on the Atlantic coast. A ship railway was decided upon some time ago, and work on the same has been commenced and will be completed in about twelve months from this time. The rails for this track will be of steel and the heaviest ever made—110 pounds to the yard. There will be a double track, upon which a train will rest for holding the ship during its transfer. Two locomotives of mammoth construction will be employed in drawing the train with its burden across the isthmus. The vessels to be transported will be hoisted by hydraulic power from the basin into the cradle. The time of passage will occupy only two and one-half hours.

THE PROPOSED ENGLISH CHANNEL BRIDGE.—The French Government seems to be in earnest in regard to this scheme. The Government has appointed a committee to examine the plans which have been proposed by the projectors.

OVER 2000 feet of the Hudson river tunnel have already been excavated.

EIFFEL TOWER shares are quoted on the Paris bourse at 160, 100 being par.

USEFUL INFORMATION.

WHERE DO WHALES GO IN WINTER?—A mystery of the Arctic regions may be cleared up next year, if the season is open. This mystery is: Where do the whales go when ice begins to set in along the Alaskan Coast? Whalers know they go eastward, and it is supposed they congregate about the mouth of the great Mackenzie river, but this and the region to the northeast of the river's mouth are practically unknown territory. The Pacific Steam Whaling Co. of San Francisco has just purchased a strong steamer, which will be sent to the Arctic next spring with orders to push through to the mouth of the Mackenzie. The reason for this is that whalebone is rising in price, and this season's catch showed that the whales are rapidly decreasing in their usual feeding grounds.—*Ec.*

FILAMENTS FOR INCANDESCENT LAMPS.—It may not be generally known that the fine filaments over which the electric current runs in an incandescent lamp, are, in many cases, made of split bamboo. The preparation of these filaments is quite an art in itself. Each operative is given a small bundle of bamboo splints of less than 1-16 inch cross-section, and these are drawn through a series of fine holes until shaven down to the required size. The bamboo is then quite pliable and easily bent into the peculiar twisted form, as seen in the lamp. In this condition it is carbonized and is then ready for the lamp and electric current. Different companies use different methods. The Thomson-Houston use the bamboo filament; the Westinghouse, a prepared substance covered with lamplack.

PAINT FROM POTATOES.—Paint from potatoes is a new wrinkle in the arts and sciences. Kuhlows' *Trade Review* gives the manner of preparation. Boil a kilo of peeled potatoes in water; after mashing, dilute with water and pass through a fine sieve. Add two kilos of Spanish white diluted with four kilos of water, and the result will be a color of beautiful milk white. Different colors can be effected by the addition of different colors or minerals. Apply with a brush; it adheres to plaster and wood very well, will not peel, and best of all is cheap.

TO WASH PLUSH CLOAKS.—First hang your cloak on the line and get all the dust out of it with a switch. Then spread it on the back of a chair and sponge every inch of it with warm rain-water and a little ammonia. Take a dry sponge and rub the cloak until it is almost dry. Rub both ways, back and forth, until the nap is thoroughly raised. Lastly, hang the cloak in the sun until it is perfectly dry and brush it with a soft brush.

HOW TO WASH WHITE SILK HANDKERCHIEFS.Never allow silk handkerchiefs to become too dirty. Wash them in a warm lather made with pure white curd soap. This water should be blued, also the rinsing-water. Roll up tightly in a cloth, and iron the handkerchiefs between linen. The iron must not touch the silk, otherwise it will turn yellow. This method has been found the best for keeping silk handkerchiefs white.

COLONEL FRED CROCKER and his railway associates are pleased with the results of the land sales from their grants last year. For that period there were sold 198,477.63 acres for a total price of \$748,456.42. Of these figures the land grant of the Central Pacific road must be credited with sales aggregating 153,000 acres for \$548,954.81 and the land grant of the Southern Pacific road with 45,477.63 acres for \$199,501.61.

EGYPTIAN MUMMIES.—It has been estimated that more than 400,000,000 human mummies were made in Egypt from the beginning of the art of embalming until its discontinuance in the seventh century. Herodotus and Diodorus agree in the statement that there were three grades of embalming. The first cost in our money, about \$1225, the second about \$375, and the third was very cheap.

A NOVEL FREAK OF NATURE.—At Plant City, Fla., there has been found what seems to be a half orange with a smooth skin, and a half lemon with a rough skin, the latter being a little larger, growing together as one fruit.

A WOOLEN CLOTH is much better than a brush to polish the kitchen stove, as it makes but very little dust and gives a softer gloss to the iron. A person with weak lungs should never use a brush for this work.

CIGARS.—It is estimated that 4,000,000,000 cigars are consumed in this country annually. Sixty-six to every man, woman and child in the country.

MILK. If put in an earthen jar, or even the can, will keep sweet for a long time if the receptacle is well wrapped in a wet cloth.

THE WINGS of turkeys, geese and chickens are good to wash and clean window, as they leave no dust or lint, as cloth.

ALASKA cost the United States Government two cents an acre.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 50.

Passing Events.

The stormy weather has continued, and in the mountains has blocked up roads and done more or less damage. A great deal more water has to be handled in the mines than usual, and work at some of the mills has stopped owing to the cold weather.

The influenza, or *grippe*, which has been prevailing abroad and in the East in epidemic form, has made its appearance here, but it appears to be of a much milder nature than has been the case elsewhere.

People in the mountains report a heavier snowfall than for many years. There will be an abundance of water in the spring—probably too much—and the owners of gravel mines regret that they will be unable to utilize it.

The electric plant of the Nevada mill, on the Comstock, has received its final test and has been accepted. This successful application of the use of electric-power to quartz-milling purposes will doubtless lead other mining companies to investigate the system.

Last year Alex Parker sold a gravel claim on the South fork of Scott river to a Chinese company, who paid \$50,000. The Yreka Union says they are taking out large sums every month, and the miners think they have one of the best properties in Northern California.

The Harvard Observatory.

The gift of \$50,000 received last summer by the Astronomical Observatory of Harvard College from Miss C. W. Bruce of New York for the construction of a photographic telescope of novel form, has enabled the observatory to make a contract with Messrs. Alvan Clark & Sons for a telescope having an aperture of 24 inches and a focal length of 11 feet. The Bruce telescopes will be especially adapted to studying the very faint stars, and will give a large plate reducing the work of making star maps. Its principal uses will be probably for the study of the distribution of the stars for complete catalogues of clusters, nebulae and double stars and for the spectra of faint stars.

The report of Prof. E. C. Pickering of the Harvard Observatory states that an expedition to Southern California gives them a mountain station under climatic conditions much superior to those of the eastern portions of the United States, and promises to be a satisfactory solution of the problem contemplated by Mr. Boyden in his will.

Under the Henry Draper Memorial Fund, the first research on the spectrum of over 10,000 of the brighter stars is now nearly completed and is partially in print. The photographs required for the second research on the spectrum of the fainter stars are also nearly complete.

The 13-inch telescope mounted on Mt. Wilson, Southern California, has done good work, and 1155 photographs have been obtained. As the same objects have been repeatedly photographed at Cambridge with the same instrument, an accurate comparison of the atmospheric conditions of the two places may be made. The evidence already secured shows that in summer results can be obtained at Wilson's peak which cannot be obtained at Cambridge. The difference is very pronounced for such objects as the markings on Jupiter. Clusters like that on Heron's are well resolved, so that the individual stars are easily measured, which cannot be done with the heat Cambridge photograph. As a test object, the sixth star in the trapezium of Orion nebula is clearly photographed for the first time. A new variable star has been discovered in the midst of the cluster G. C. 3636. A beginning has been made of the measurements of the position and brightness of the double stars, and it is hoped to extend this work to the clusters and thus furnish an extensive addition to this department of micrometric astronomy.

South African Gold.

Notwithstanding all the predictions of wonderful richness, the Transvaal gold-fields did not make such a remarkable showing last year. The whole of South Africa only produced \$8,000,000; and instead of there being 2000 stamps dropping with a monthly product of 75,000 ounces, there are only 35 mills with 900 stamps, and far less than that many ounces per month.

The big English syndicates that were to reap such fortunes must be much disappointed. There has been more stock-gambling than mining, and the 160 companies operating have made very little money. There is a scarcity of water and a scarcity of competent miners.

A good many rose-colored statements about these mines have been circulated in this country, with directions how to get to the country, etc. But Africa is so distant, few good gold-miners have been attracted from here. Several California superintendents have gone out there and have done well; but it is no place for an ordinary miner to go if he is making a living at home.

REDUCTION OF BODIE SALARIES.—At a special meeting of the directors of the Bodie Consolidated Mining Co., held on January 15th, the salaries of the officials of the company were reduced over 50 per cent. This action, it is claimed, was due to the present discouraging outlook in the mine and also a difficulty of collecting future assessments. At the meeting Captain John Kelley sent in his resignation as superintendent, and another Kelly was appointed to the position. The latter person is very highly spoken of by those who know him.

THE coal shipments from the various collieries in Vancouver island during the past year amounted to 427,883 tons.

The Electric-Motor Plant.

The Brush electric-motor plant to operate the Nevada mill on the Comstock, fully illustrated and described in the PRESS a few months since, has been tested and finally accepted. The plant is the largest of the kind in the world. At first there were some obstacles to overcome, and nobody seemed to know how to remedy them. H. S. Conner, a skillful electrician, came out from Cleveland to ascertain if there were any defects in the electric plant that caused its failure to fill the contract with the mill company. Mr. Conner proceeded to thoroughly overhaul the entire plant, from the dynamo chamber to the surface motors, and after a test was satisfied that the reason the plant did not fulfill the specifications of the contract with the Nevada Mill Company was due solely to the incompetency of the electricians who had charge of it during the first test. The mill has now been in constant operation, propelled by this electric plant, for three months as a final test. The test proved that 63½ per cent of the power generated in the dynamo chamber is landed on the surface motors—which is three and a half per cent more than the contract between the Brush Electric Company and Nevada Mill & Mining Company specifies. The *Virginia Chronicle* says:

The plant is the largest in the world and the cost is \$100,000. It consists of six dynamos of 100 horse power each, placed on the Sutro tunnel level of the Chollar incline, 1630 feet below the surface. These dynamos are operated by Pelton water-wheels placed on the same level. The wheels being driven by a volume of 187 inches of water confined in an iron pipe ten inches in diameter, leading from the surface-tank to the point of discharge, 1630 feet below.

The electric power generated by the dynamos is transmitted on copper wires to the surface motor-room, 2300 feet distant from the dynamo chamber.

A total of 450-horse power is required to operate the mill, which is equipped with 60 stamps, 16 pans, 10 settlers, 2 agitators and 3 sulphuret pans. Of the 450-horse power required to operate the entire mill, the Brush electric plant furnishes 350-horse power; the surface Pelton wheel on which the volume of water required to operate the Sutro tunnel dynamo is discharged prior to passing down the incline, furnishes the auxiliary power of 70 per cent.

The Bowers Dredge.

We are informed that the Bowers dredge at Tacoma is now excavating—and discharging through 3600 feet of pipe—2000 to 3000 yards of sand each 24 hours, and has nearly filled up a large tract of land for railroad purposes. It has another contract for filling in 1,000,000 cubic yards on which it will commence work in about a month, as soon as the present contract is completed. This is the same machine which was at work for some time in San Diego bay, and was towed up to Tacoma. It is capable of handling a much larger quantity of material through a shorter discharge pipe, but in this instance there are many shells which lodge in the bottom of the pipe and cause considerable friction. Otherwise the output would be two or three times as much. The harbor is being deepened at the same time that new land is being made for business purposes.

It is reported on pretty good authority that the patent right for the Puget Sound region has been sold for a large sum of money.

Mr. A. B. Bowers' suits for infringement against the Von Schmidt, Lynch, Obequette, Atlas and Hercules dredges are now pending in the United States Circuit Court in this city.

William T. Garratt.

The well-known pioneer foundryman, Wm. T. Garratt, died suddenly of heart disease on Tuesday. Mr. Garratt was 60 years of age, and may be said to have been in vigorous health up to the time of his last illness. He was born in Waterbury, Conn., and came of English stock. He came to San Francisco in 1850, and after mining in Nevada Co. for a while came back here and entered the foundry of G. W. Schnitz. The firm at that time was carrying on the dual business of coining \$5 and \$10 pieces and manufacturing brass and iron implements. Shortly afterward there was a dissolution of partnership, Schnitz retaining the coining department and Garratt taking the foundry. From that time until the day of his demise Mr. Garratt was connected with this business, and notwithstanding many reverses, lived to see his labors crowned with success in the establish-

ment of the most complete brass foundry on the coast.

His establishment was burned down several times, but finally he took the premises corner of N. Stoma and Fremont, where he has been many years. The large branch on Fifth and Brannan has only been operated a few years. Mr. Garratt has been president of the Manufacturers' Association and a member of the Chamber of Commerce and various organizations. He was one of the trustees of the State Mining Bureau at the time of his death. Besides his interest in the foundries, he was largely engaged in steamboat, railroad and mining enterprises at various times, and stood high in the business community.

Comstock Superintendents' Salaries.

There were days on the Comstock when every mine, big or little, had its superintendent at a handsome salary, some of them with very little indeed to do. But those days are gone; now, one man superintends several mines, even in the case of very important ones. The superintendents, moreover, have not now mere ornamental positions, and there are no \$1000 a month salaries, with double teams to drive and no duties except to entertain people.

Among others, the following monthly salaries are paid to mine superintendents on the Comstock, Virginia City, Nev.: To R. P. Kesting by Hale and Norcross, \$400; Savage, \$400; and Scorpion, \$150; total, \$950. A. C. Hamilton by Chollar, \$250; Potosi, \$250; Exchequer, \$150; Alpha, \$150; total, \$800. Mr. Kerwin by Best and Belcher, \$250; Gould and Curry, \$250; total, \$500. A. Lookey by Overman, \$200. D. B. Lyman by Con. California and Virginia, Ophir and Mexican, each \$187.50; Occidental, \$150; Sierra Nevada, \$250; Union, \$125; total, \$987.50. S. L. Jones by Crown Point, \$500; Belcher, charged in Crown Point, Seg. Belcher, \$150; total, \$650. W. E. Sharon, Challenge, \$250; Confidence, \$250; Yellow Jacket reported \$250; total, \$750.

The largest aggregate salary of any official connected with Comstock mines is that of O. E. Elliott, mining secretary, and next to the largest is that of A. K. P. Harmon, mining president. The latter's income from that source is \$850 a month.

But they do not pay the superintendents such salaries on the Comstock as are paid in some other places. A number of them have gone abroad for foreign companies and receive very handsome annual sums. For instance, Mr. Patton, formerly of the Comstock, gets in Australia \$30,000 a year for superintending the Broken Hill mine.

In the Mountains.

In the mountain and mining counties, there has been a very heavy snowfall this winter. In fact there has been more snow than in the memorable winter of 1860, and more cold weather than in 1853-4. Some lives have been lost by snowslides and travel is everywhere impeded. Some mills and mines have had to close down because of lack of supplies or the freezing up of ditches. The railroads have had difficulty to keep in operation, and teaming has been impossible. In the gulches and bottoms the snow has been soft, so as to render snow-shoeing very hard. The ground is thoroughly soaked so that the pumps at all the mines have been kept busy. In some places, as at the summit, 16 to 17 feet of snow has fallen on a level.

What will happen in the spring if this snow melts rapidly is unpleasant to contemplate. The hydraulic mine-owners regret that they will be unable to work, though there will be an abundance of water; but for other mining operations a prosperous year is predicted. The snow has come much lower down the foothills this year than is ordinarily the case.

TWO COMPETENT MEN.—The mining combination that has entered into a compact to commence pumping water out of the Gold Hill mines has engaged W. R. Eckart, a prominent mining and civil engineer, and Mr. James E. Dow, manufacturer of pumping and general hydraulic machinery, of San Francisco, to draw up plans for the purpose and to produce a pump for sinking purposes. After the water is lowered, it is intended to double the pumping capacity by placing a stationary pump at the lowest point obtainable.

Shocking Waste of Timber.

We have often had severe denunciations of timber waste and earnest appeals to people to refrain from it, but no verbal exhortation could be so eloquent as the picture which we give upon this page. It was made by the Dwyer Engraving Co. for the State Board of Forestry directly from a photograph submitted by W. S. Lyon, State Forester. Consequently it presents an actual scene and one which fortunately one does not need to go far to see its like in the timbered regions of the State. The picture accompanies a memorial which the State Board of Forestry has just transmitted to Congress and is well calculated to open the eyes of the law-makers to the onpable waste of valuable property which should be summarily checked by adequate legislation. The cutting which the

stances these outrages are perpetrated upon the public domain, and are as indefensible as would be the acts of a farmer in burning the fields and breaking down the fences of another for the purpose of securing a more expeditious route to market."

The memorial of the State Board is a strong document on many accounts. It alludes first to the need of maintaining a forest covering on our mountain to conserve the water for irrigation of our arid lands. This is a subject which is each year commanding wider support, and we are glad to know that organized effort in some of our irrigated districts is being put forth to secure the desired ends. The memorial presents that the most feasible way to secure the retention of a forest covering is to withhold the timber land from sale or entry and to sell the timber crop, guarding the area so that

Natural Gas.

The continuous discoveries of natural gas in so many different portions of the world give rise to the question whether its generation is of modern occurrence or more antique origin. Its existence has been known in isolated locations for over a century in the United States. In those localities it was exceedingly limited in quantity, and while it was considered a curiosity, it never rose to any importance. But within a comparatively few years past, it has assumed such gigantic proportions as an illuminator for cities and towns, and as a fuel in furnaces, factories and dwellings, that it becomes a marvel, if it is not of recent origin, why its utility was suffered to remain so long unrecognized. It was known in the Province of Tsien Lan Tsing, China, and wells were

per diem, according to a report by Prof. James Dewar, F. R. S. This flow has been going on from old wells for 10, 12 and even 20 years in the vicinity of Pittsburgh. The immense expansion that follows this wonderful flow reduces the temperature so greatly that near the top there is an ice coating on or near the whole of the pipe. This refrigerating property has manifested itself in several gas wells. In some cases the ice has formed so solid about the drills that it checked operations for the time being. At Jo Jo, in Western Pennsylvania, gas was struck at 1000 feet. In attempting to bail the well, the bailer stuck fast for awhile. When it was at last brought to the surface, the bottom was covered with ice.

Natural gas is now found in every civilized country. The aggregate flow of all the wells of the world would make such a startling array

IMPROVIDENT METHODS OF CUTTING TIMBER, AS INSTANCED IN THE MEMORIAL OF THE STATE BOARD OF FORESTRY.

opening the way to private property or to give access to still richer stores of public property. Thus the acts are strictly within the scope of the General Government. The memorial to which we allude makes this forcible allusion to the destruction of timber to which we refer: "A forest, or timber, like any other crop, when mature, is fit to harvest, and when not subject to wasteful abuses may with propriety and benefit be cut; when, however, to facilitate access to a tract, vast quantities of intervening lands are laid waste and valuable timber is left engraving shows was not for the purpose of supplying merchantable lumber or fuel, but merely for opening the way to more densely wooded tracts. If men did this on their own lands the orifice could not do much more than deplore the wanton waste, but such cutting generally occurs on the public domain for the purpose of to decay and destruction (as is well illustrated in the accompanying photographic reproduction of a common incident of our lumber country), these methods become improvident and should be rigorously suppressed. In most lu-

a second growth shall not be interfered with by fire or sheep-herding. This would make the timber area of our mountains, which is still owned by the Government, a perpetual reserve which shall, through all coming generations, furnish ample supplies of timber and fuel, and at the same time rescue the valleys in the future, to some extent at least, from ruinous floods, and to store water to be sent down gradually upon the plains as irrigators can use it. These things should command public attention and support, and we have no doubt the efforts of our State Board will have much influence in that direction.

THE MINT COMMISSION.—Among the commissions appointed by the President to test and examine the weight and fineness of coins at the several U. S. Mints are Senator J. P. Jones, H. L. Dodge and Prof. Thos. Price of this city.

RAIN fell in Oregon and Washington 19 days, in Southern California on 18 days, and in Northern California on 24 days in December.

drilled there 3000 feet deep. The gas was conveyed through bamboo pipes and burned in clay burners. In Virginia, in 1775, Washington set apart a square mile of territory in Kanawha valley, in which was a burning spring which he deeded to the public forever, but his purpose was defeated. When General Lafayette passed through the then village of Fredonia, N. Y., about 40 miles south of Buffalo, the inn at which he stopped was illuminated by natural gas through 30 burners. In 1859 its presence was well known in the coal regions of Pennsylvania. In 1865 a well was drilled near Wilcox, 100 miles east of Erie, from which gas flowed under a pressure of 600 pounds to the square inch. Until 1881, natural gas was only used for local illumination, for local fuel and the manufacture of high-grade lampblack. Its flow was permitted to escape without utilization. The exact loss cannot be ascertained, but it approximates closely to an equivalent of 100,000,000 tons of coal. The amount of gas which flows from some individual wells reaches the enormous quantity of 30,000,000 cubic feet

of figures as would terrify those who saw it into a belief that some terrible catastrophe would result from such an extraction from the earth's center. Three hundred and fifty million cubic feet came daily to Pittsburgh in September, 1886. In some adjacent localities the daily flow is 30,000,000 cubic feet. The Karg well at Findlay, O., discharged 40,000,000 cubic feet per day, and other wells there wasted in the air 10,000,000 daily. At Belle Vernon the outflow is 12,000,000 feet per 24 hours. The aggregate of eleven districts amounts to 8,644,000,000 cubic feet of natural gas every 24 hours. The pressure per square inch varies from 200 to over 600 pounds. The flames from the burning gas reach the height of from 50 to over 100 feet. If a correct statement of the products of the gas-fields of the United States could be obtained it would probably reach the enormous amount of over 20,000,000,000 cubic feet each day of 24 hours. This would be equal to a space of 28,967.66 square miles. The elasticity of the gas and the additional supply which would rise to fill the otherwise vacuum, pre-

vents the occurrence of a catastrophe which would be direful in its consequences. The question then arises: How long can this withdrawal from the earth's center continue harmless? At present, its escape from below, the surface of the earth may be preventive of an awful explosion. It may be the safety valve to let off some of the enormous pressure, which as mentioned above reached at times over 600 pounds to the square inch. This subterranean pressure must be continually increasing, despite the activity of all the volcanoes of the world; and the drillings, though but an infinitesimal factor compared with the surface of the earth, may retard temporarily, in connection with them, the final destruction by fire which is foretold as the doom of the globe. When we remember that some far distant stars have suddenly burst into flame and been lost to sight ever after, it may be a natural ratiocination that they were resolved into their primal gaseous condition which La Place asserts to have been their origin.

The commercial value of natural-gas wells may be better understood when it is known that pipe lines are extended 20 or 30 miles, and that one of the companies is estimating the cost of piping the gas 90 miles to Cincinnati, and delivering there 20,000,000 cubic feet per 24 hours! The obstacle they will have to contend with will be the condensation in extreme cold weather, which will diminish the pressure at the terminus of the line. The Philadelphia Company is piping into Pittsburgh 300,000,000 to 500,000,000 cubic feet of natural gas per day. This is equivalent to from 20,000 to 25,000 tons of coal.

Regarding extensive explosions of natural gas deep down in the wells, no apprehension need be experienced on that score. To render the natural gas explosive, it requires to be intermixed with from 9 to 14 parts of air to one of gas. While the pressure of gas at the surface is over that of the atmosphere, which is about 15 pounds to the square inch, it follows as a matter of course that the air cannot descend into the well. Before the pressure would be reduced sufficiently to admit from 9 to 15 parts of air to one of gas, the water would rise above the gas, even if it did not flow from the well. Consequently under this condition the mixture of air and gas could not occur. Another preventive would be that when the pressure became so greatly reduced, the sand would choke the well; this would keep the air from reaching the gas. There is therefore no cause to apprehend any vast explosion, or even a limited one.

The durability of the yield of gas may be considered positive. The gas is the resultant of the commingling of hydrocarbon oils and water. A slight quantity of air would accelerate the evolution of hydrogen from the water blended with the oil.

The most recent geological formations are all permeated by hydrocarbon compounds of some kind. It follows that the gas is generated by chemical action or by resolving into its original elements some compound mineral substance; consequently the formation of the gas is progressing continuously at the present time, as it has ever been. These carboniferous strata are replete with oils and hydrocarbons, which are continually being transposed into new forms by either or both an increase of oxygen or hydrogen. The liquid form, if exposed to the air, becomes a vaporous hydrocarbon. As this chemical action is in constant operation, the supply of the gas may safely be considered as certain for all time to come. The final conflagration must arise from some other source than that of the gas wells, for their sphere is too limited to affect the entire globe, for the aggregation of them all would be equal only to a small grain of dust upon a six-foot globe.

The natural-gas industry may therefore be considered as an enduring one that will increase instead of diminishing its supply.

DELINQUENT SALE NOTICE.

Booth Gold Mining Company. Location of principal place of business, San Francisco, California. Location of Works, Auburn, Placer Co., Cal. NOTICE.—There is delinquent upon the following described Stock, on account of Assessment (No. 4), levied on the 23d day of November, 1889, the several amounts set opposite the names of the respective Shareholders, as follows:

NAMES.	No. Certificates.	No. Shares.	Am't.
Richard Chenery, Trustee.	160	6,275	\$125 50
Richard Chenery.	17	5	10
Charles F. Eaton.	171	300	6 00
Charles F. Eaton.	172	300	6 00
Charles F. Eaton.	173	60	1 20
R. N. Craves, Trustee.	25	250	5 00
E. S. Harrison.	177	1,000	20 00
Ces. R. Spinney, Trustee.	32	312	6 24
Geo. R. Spinney, Trustee.	176	500	10 00
E. P. Slosson, Trustee.	181	500	10 00

And in accordance with law, and an order of the Board of Directors, made on the 23d day of November, 1889, so many shares of each parcel of such Stock as may be necessary, will be sold at public Auction, at the sales-room of Middleton & Sharro, No. 22 Montgomery street, San Francisco, California, on MONDAY, THE TWENTY-ETH (20th) DAY OF JANUARY, 1890, at the hour of 3 o'clock p. m., of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of the sale.

GEO. R. SPINNEY, Secretary.

Office, 310 Pine St., Room 23, San Francisco, California.

QUICKSILVER

For Sale in Lots to Suit by
FARRITT & CO.,
806 California St., San Francisco, Cal.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco, Cal.

PRACTICAL

Books on Mining AND IRRIGATION.

PRACTICAL GOLD-MINING.—A comprehensive treatise on the origin and occurrence of gold-bearing gravels, rocks, and ores, and the methods by which the gold is extracted. By C. G. Warford Lock. 788 pages, with 8 plates and 271 engravings in the text. 4to, cloth, \$15 00, express prepaid.

IRRIGATION.—Egyptian Irrigation. By W. Willcocks, with introduction by Lt. Col. J. C. Rose. This work embodies the information collected during four and a half years of the irrigation systems of Egypt. Engineering questions, such as silt-deposits, drainage, irrigation, the Barrages, flood protection, methods of regulation, locks, etc., have been treated in detail. 367 pages, large 8vo, with 26 plates and numerous engravings in the text. Price \$15 00, express prepaid.

MEXICAN MINES.—Dahlgren's Historic Mines of Mexico, only a few copies left; price \$25 00. Handbook to the Historic Mines of Mexico, price \$1 00.

Descriptive Catalogue and Circulars of Books relating to Assaying, Mining, Electricity and Mechanical Engineering, sent free on application.

OF BROOKLYN, N. Y.
43 DEY ST., NEW YORK.

C. H. EVANS & CO.

(Successors to THOMSON & EVANS),
110 and 112 Beale Street, S. F.

MACHINE WORKS,
Steam Pumps, Steam Engines
and all kinds of MACHINERY.

FOR RENT, CHEAP.

BRICK BUILDING at corner of Folsom and Nineteenth streets, in subdivisions, floors or parts of floors. Will furnish power and give leases.

CHARLES ASHTON,
411 Montgomery Street, S. F.

"WITTER'S SPRINGS." 18 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases, Rheumatism, etc. Address H. L. DENIO, Upper Lake.

List of U.S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING DEC. 31, 1889.

- 418,346.—STATION INDICATOR—M. Anthony, S. F.
 418,347.—STATION INDICATOR—M. Anthony, S. F.
 418,639.—SHIRT—Frank Bauer, Slide, Cal.
 418,496.—SUCTION DREDGE—J. W. Brown, S. F.
 418,505.—HASP LOCK—Descalzo & Mortimer, Peters, Cal.
 411,052.—COLLAR STUFFING MACHINE—C. Ewing, S. F.
 418,407.—FRUIT DRIER—F. H. Gilbert, Union Ridge, Washington.
 418,612.—OCEAN MOTOR—L. S. Goldman, Los Angeles, Cal.
 418,513.—HYDRANT COUPLING—S. R. Hackley, S. F.
 418,514.—CONCENTRATOR—I. W. Heilig, Pottstown, Pa.
 418,531.—WINDMILL—A. G. Norton, Arroyo Grande, Cal.
 418,471.—SETTING SPUD FOR DREDGERS—A. P. Payson, S. F.
 418,221.—DERRICK—W. B. Pless, Stockton, Cal.
 418,590.—SURF POWER—J. Ringer, Coronado, Cal.
 418,481.—HYDRO-CARBON BURNER—J. H. Whitburo, Los Angeles, Cal.

FOR WEEK ENDING JAN. 7, 1890.

- 418,860.—METALLIC ROOFING—H. Anderson, S. F.
 418,862.—SHOE FOR THRASHERS—Henry Bryao, Modesto, Cal.
 418,941.—BROOM-BRUSH BRIDLE—J. B. Buteoschon, Portland, Or.
 418,943.—WAVE MOTOR—R. B. Davy, San Diego, Cal.
 418,865.—OAT HULLER—L. C. Dibert, S. F.
 418,867.—DISCHARGE DOOR FOR STEAM DIGESTERS—P. F. Dundon, S. F.
 418,868.—ANNUNCIATOR—J. Finck, S. F.
 418,712.—TRACK GAGE—J. J. Griffin, San Bernardino, Cal.
 418,946.—FOLDING BED SCREEN—J. J. Griffin, San Bernardino, Cal.
 419,014.—STAMP CANCELING MACHINE—W. Groth, Seattle, Wash.
 418,870.—RULER AND PENCIL SHARPENER—J. T. Hazlett, S. F.
 418,871.—ELECTRICAL INDICATING APPARATUS—G. A. Holt, Oakland, Cal.
 418,730.—HOP-DRIER—W. J. Leechman, Slaughter, Wash.
 418,873.—WELL-BORING APPARATUS—E. F. Littlepage, San Jose, Cal.
 418,732.—CAR-COUPLING—A. Lyoch, Eugene City, Or.
 418,874.—SAW SETTING MACHINE—B. McIntire, S. F.
 419,066.—LIFE PRESERVER—O. Quist, Colton, Cal.
 418,877.—WINDMILL GOVERNOR—A. J. Salisbury, Hueneme, Cal.
 419,082.—HORSE-CHECKING DEVICE—W. P. Smith, Renton, Wash.
 418,964.—KNIFE CLEANER—Jos. Thompson, Decoto, Cal.
 418,965.—BIRD TRAP—B. Walton, Compton, Cal.
 418,966.—VENTILATOR FOR BOOTS AND SHOES—P. Weland, S. F.

The following brief list by telegraph, for Jan. 14, will appear more complete on receipt of mail advices:

California—James Spiers and E. H. Booth, S. F., rock-breaker; Jacob Price, San Leandro, traction engine; James M. Schofield, Merced, bottle-topper; Bartlett McIntire, assignor to the Vulcan Iron Works, S. F., clip for wire rope way; George W. Pardee and G. and R. H. Leaman, Tower Lake, wagon-brake; Edward M. Knight, San Mateo, assignor to Rapid Safety Filter Co., S. F., filter; Frank A. Huntington, S. F., cushioning-mill; William H. Keep, assignor of half to S. A. Hathaway, Stockton, windmill; Miss B. Dodge, assignor to Parks & Lacy, S. F., two patents for rock-breaker; George E. Dow, S. F., pump; John W. Eisenhuth, S. F., clipping machine; Isaac B. Abraham, S. F., adjustable and removable armor for ships; Frank W. Bitley, S. F., flexible shaft coupling.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COMBINED RULER AND PENCIL-SHARPENER. John T. Hazlett, S. F. No. 418,870. Dated Jan. 7, 1890. This is one of that class of articles in which a ruler and pencil-sharpener are combined in a single instrument or device. In this the ruler has a longitudinal groove in its top with side flanges, and a pencil-sharpener seated in said groove with its surface below the surface of the ruler, whereby the side flanges serve as guides for the movement of the pencil and the sliding strips in said groove at each end of the ruler, and abutting against the ends of the sharpener for holding the sharpener in place.

DISCHARGE DOOR FOR STEAM DIGESTERS AND RETORTS.—P. F. Dundon, S. F. No. 418,867. Dated Jan. 7, 1890. The invention relates to a drop bottom or door for discharging the contents of digesters or steam tanks which are used for rendering lard, tallow, and other like matters. It consists of a door or bottom suitably fixed to the bottom of the digester, a lever-arm and a supplemental eccentric lever for locking the same, and the door when closed, and a screw which acts against the door to produce any desired compression upon it after the

lever is locked in place, together with certain details of construction.

ANNUNCIATOR.—Julius Finck, S. F. No. 418,868. Dated Jan. 7, 1890. The invention relates to the drops for electric annunciators. It consists in the novel arrangement of the drop-shutter and the armature of the magnet. The object of the invention is to provide an annunciator drop which is adapted to be operated by a simple construction and arrangement of the armature, thereby simplifying and lessening the cost of the manufacture of the device.

OAT HULLER.—Lloyd C. Dibert, S. F. No. 418,865. Dated Jan. 7, 1890. This invention belongs in the class of grinding-mill-stock machinery and the object is to provide a machine of this class of great capacity and adapted for rapid and effective work.

SHOE FOR THRASHING MACHINES.—Henry Bryan, Modesto, No. 418,862. Dated Jan. 7, 1890. This patent covers certain improvements in thrashing-machines, and it is especially applicable to the shoe in which the sieves or screens are fixed. The peculiar movement given to the shoe is particularly useful in clearing the sieve of green heavy weeds which are often cut and carried through the threshing and cleaning machinery and which are liable to clog the cleaning sieves. By the peculiar motion designed the weeds are lifted continuously and the grain allowed to settle through and separate from them.

WINDMILL GOVERNOR.—Alfred J. Salisbury, Hueneme, Ventura Co. No. 418,877. Dated Jan. 7, 1890. By means of a variable fulcrum and a series of weights any wind may be utilized by the windmill, giving each velocity of wind only such work as it can do.

ELECTRICAL INDICATING APPARATUS.—Geo. A. Holt, Oakland (Mary E. Holt, administratrix of said G. A. Holt, deceased). No. 418,871. Dated Jan. 7, 1890. The object of this invention is to provide for the electrical transmission of the readings or record of one indicator located in a given position to one or more indicators located or distributed at convenient points, whereby the condition of the first-named indicator may be readily seen without examining it directly. The invention consists in the novel circuit-maker and breaker in connection with the indicator whose readings are to be transmitted, the novel mechanism of the indicator to which the readings are transmitted, an electric circuit, and details of construction. This device may be used in connection with the indicator of a ship's log, or, in fact, any kind of indicator.

SAW-SETTING MACHINE.—Bartlett McIntire, S. F., assignor to the Vulcan Iron Works. No. 418,874. Dated Jan. 7, 1890. This is a simple and effective saw-setting machine especially adapted for the setting of the teeth of band-saws.

WELL-BORING APPARATUS.—Europe F. Littlepage, San Jose. No. 418,873. Dated Jan. 7, 1890. A casing is lowered into the outer casing of the well, within which it moves easily; a chain provided with elevator buckets is lengthened the desired extent, and a sufficient number of the lengths of a channel-iron guide are attached together to lower the cutters to the bottom of the well. The chain being revolved by means of the driving shaft and gearing at the top, it causes the revolution of the chain-wheel and shaft within the casing at the bottom of the well. The cutters are caused to continuously excavate the material beneath the well-casing so as to allow the latter to be pushed down as the work proceeds. At the same time the elevator buckets on the chain serve to carry up all the material excavated and delivered at the top of the well, this operation continuing as long as may be desired.

METALLIC COVERING FOR ROOFS AND WALLS. Henry Anderson, S. F. No. 418,860. Dated Jan. 7, 1890. This is an improvement in covering the roofs and walls of buildings and consists of narrow strips, which are nailed upon the studding or rafters of the building, and in conjunction with these of a series of overlapping, fire-proof metallic plates or shingles, which are placed upon these strips and are in turn held in place by them.

QUICKSILVER STATISTICS.—The Superintendent of Census has appointed J. B. Randol of this city as special agent of the Census Office for the collection of statistics relating to quicksilver. No better appointment could have been made, Mr. Randol being thoroughly conversant with the subject and accustomed to doing such work—in fact he has personally collected the data concerning quicksilver mining for many years past, and his annual tables of production are considered authoritative. Mine operators and owners of works are assured that their answers to the questions sent them will be held strictly confidential and the names or operations of individuals will not be disclosed.

ROBERT M. HOWLAND of this city, well known in the mining regions of the coast, died at Lordsburg, N. M., on Tuesday last. He was 51 years of age and came to the Pacific Slope from the State of New York 33 years ago, and was one of the first miners in the White Pine district and in several other camps of Nevada.

THE lumber-mills on Puget Sound have reduced their working-time.

The Magnetism of Some Metals and Minerals.

[Written for the PRESS by MELVILLE ATTWOOD.]

The nine metals classified as "Noble Metals" are non-magnetic and do not therefore exert any influence on the magnetic needle. They are as follows:

	Specific gravity.
1—Mercury	13.5
2—Silver	10.47
3—Gold	19.4
4—Platinum	21.5
5—Palladium	11.8
6—Rhodium	11
7—Iridium	22.4
8—Ruthenium	12.7
9—Osmium	22.5

Of the base metals, five are known to be magnetic, namely:

	Specific gravity.
1—Iron	7.8
2—Nickel	8.8
3—Cobalt	8.5
4—Chromium	6.8
5—Manganese	7.2

To this number may also be added the "Native Alloy" found in the black sand with the sea-beach gold at Gold Bluff and other places on the California and Oregon coast. The native alloy occurs in thin scales of about 1-50 of an inch in diameter, and in color very much resembles nickel. It is strongly magnetic and can easily be separated from the black sand and platinum with a common bar magnet. The specific gravity is 18. An analysis was made with the following results: Platinum, 48; osmium, 44; iron, 6; remainder undetermined.

The following are a few of the "minerals" known to exert a sensible influence upon the magnetic needle: 1st, magnetite (magnetic iron ore); 2d, pyrrhotite (magnetic pyrites); 3d, franklinite (zinc ore); 4th, almandite (gem); and 5th, kyanite.

1st—Magnetite, magnetic oxide of iron. When pure it contains 72.41 per cent of iron. It occurs crystallized, massive, and in a state of sand. Chrome iron ore is sometimes met with in a similar state and may readily be mistaken for magnetic ore, but it may be instantly distinguished from the latter by being non-magnetic. Magnetite is the most important of the ores of iron, and it is from that ore, with charcoal as a fuel, that the finest kinds of iron and steel are produced.

The Russians have acquired a high reputation for a particular description of sheet iron; their mode of manufacture is kept secret, but they are made from iron smelted and worked throughout with charcoal as the fuel.

The Norwegian charcoal blooms (bloom—a lump of malleable iron hammered out into a solid, more or less rectangular mass) bring in Sheffield, England, from \$90 to \$100 per ton. The ore used for making the blooms is a magnetite, and the fuel charcoal. The charcoal is made from spruce and Scotch fir. It takes upward of a ton of charcoal for every ton pig iron produced.

The iron used at the gold mines in Brazil is mostly made by the Catalan process from magnetite with charcoal, and is much cheaper and in every respect superior to the iron used in our Californian quartz-mills.

In considering the theory of the "Catalan Forge or Blooming Furnace" (although direct experiment is required to settle the point), it is probable that during the first two hours when a weak stream of blast is found most advantageous to the process, carbonic oxide is a principal result of the smothered combustion, and this gas reacting for such length of time on a pulverized ore effects its complete deoxidation.

The subsequent increase of temperature causes the grains of reduced iron to agglutinate together, as in the puddling process, into a bloom capable of being molded under the hammer.

Specimens of Norwegian magnetite may be seen at this office. They were selected by the late David Forbes, when consulting engineer to the Norwegian Charcoal Iron Co.

In this State we have many large deposits of magnetite as pure as any found in Norway, and near them abundance of spruce, nut pine and other timber from which the best of charcoal can be made. Water-power can also be had for the blast and for forging, so that the finest kind of iron can be made in this State at a comparatively cheap rate, and with the advantage of a home market for all that can be made.

A large quantity of Norwegian iron is now being used in our different quartz-mills. This is one of the industries that has been sadly neglected.

Nickeliferous pyrrhotite is the ore from which most of the nickel of commerce is obtained. It is strongly magnetic, specific gravity from 4.50 to 4.90. It is found in quantity at the Gap mine (New Jersey), at Modum, Norway, Craigmuir mine, Scotland, at Piedmont, etc. I lately received some specimens from a large and newly discovered deposit in Canada.

The ore was so strongly magnetic that I got Mr. Laine, the lapidary, to cut out from one of the specimens a piece of the ore into the shape of a bar magnet with which I can now readily pick up iron filings.

Prof. Price has lately discovered in one of the gold mines he is working near Placerville a considerable quantity of nickel mixed with the pyritic matter.

"Kyanite," a dense silicate of alumina, when suspended on an axis, will behave like a

compass needle and may be used as such, a fact little known but worth knowing.

In the MINING AND SCIENTIFIC PRESS, Jan. 21, 1888, there is a drawing and description of an "Electro-Magnetic Apparatus for Separating Ores." It has been used extensively in freeing the magnetites from earthy matter and other impurities.

The smaller machine with permanent magnets might be used to great advantage in the milling of gold quartz and silver ore; the pulp from the batteries being made to pass over the rollers on its way to the amalgamating pans so that any magnetite or shrouded iron from the shoes and dies that might be in the pulp would be taken out of it. The abraded iron from the shoes and dies in a large mill will amount to from 100 to 300 pounds per day, according to the hardness of the veinstone.

It frequently happens that in copper mines a large quantity of zincblende is mixed with the yellow ore, rendering both nearly valueless, as they cannot be separated by dressing, but if both are crushed fine and dressed together and afterward carefully calcined, and the calcined ore passed over the magnetic rollers, the copper will be separated and the zinc may be distilled without injuring the retorts—so that both ores may by that simple means be made valuable.

In 1867 David Forbes gave me a small "dipping needle" of the same pattern as then used by the Norwegian mining engineers for tracing their magnetic iron deposits, which are sometimes covered to a considerable depth with earthy matter.

A large-sized instrument after the same pattern, with a movable graduated circle attached to it, could be used in the examination of large cast and wrought iron shaftings. By simply passing it along the face of the shaft it would show if there was any defect in the casting of the former or welding of the latter.

Meetings and Elections.

SAN FRANCISCO STOCK AND EXCHANGE BOARD, Jan. 14.—President, W. E. Norwood; vice-president, Walter Turnbull; treasurer, Geo. T. Marye; chairman, O. V. Walker, and secretary, Fred W. Hadley; Committee on Membership—George C. Hickox, T. T. Atkinson, W. Edwards, J. B. Dyer, C. D. Laing, Charles E. Anderson and Charles H. Stoutenborough.

PACIFIC STOCK BOARD, Jan. 14.—Robert G. Horn, president; Stephen Otis, vice-president; R. C. Tobin, treasurer; Frank Moroney, secretary; J. B. Bourne, caller, and W. H. Wright, W. S. Taylor and T. McGinnis, Executive Committee.

SILVER KING M. CO., Jan. 14.—Directors—C. H. Fish, H. H. Noble, W. S. Lyle, Geo. E. Grey and E. A. Barney. Lawyer Crittenden submitted a resolution condemning the action of the directors in appointing a manager at a salary of \$200 a month, as contrary to law and the interests of the stockholders. Upon being put to the vote, the resolution was voted down.

THE PIONEER BUSINESS ASSOCIATION of Alaska has perfected its organization and elected the following permanent officers: John F. McGovern of Townsend, McGovern & Co., president; R. A. Wilson of Sisson, Crocker & Co., vice-president; R. B. Kittredge of Neville & Co., secretary; Leon Maison of George W. Hume & Co., treasurer. The association has also decided to instruct Miner W. Bruce, the Eastern representative of the organization, to take steps toward securing the appointment of a Fish Commission for Alaska.

SILVER KING M. CO., Jan. 15.—H. M. Noble, president; George E. Gray, vice-president; Aug. Waterman, secretary.

SIERRA NEVADA M. CO., Jan. 15.—Charles H. Fish, president; A. W. Havens, vice-president, and Con O'Connor, C. Hirschfeld and Herman Zidig, trustees. E. L. Parker was re-elected secretary and D. B. Lyman, superintendent. The secretary's financial report showed a credit of \$26,130.

Appreciative.

THE MINING AND SCIENTIFIC PRESS, the sturdy friend and advocate of the mining interests of the coast, has entered upon a new volume. The PRESS has done much for the interest it advocates and no miner should allow himself to be without it.—Trinity Journal.

THE San Francisco MINING AND SCIENTIFIC PRESS, the oldest and best paper known to us, has completed its 59th volume.—Prescott (A. T.) Courier.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

AN ARMY OF MINERS.—A total of 6175 men are employed in the mines in and about the vicinity of Butte City, Montana. The December pay roll of mines in that vicinity footed up a total of \$617,500. The Anaconda employs 3000 men and pays out monthly \$300,000 for employees' wages. The Boston and Montana and Butte & Boston Companies have a total of 1600 employees on their pay-rolls. The Parrott employs 400 miners and the Colorado and Blue Bird 250 and 300 respectively. The other companies employ from 200 to 75 men each.

Centrifugal Roller Quartz Mill.

F. A. HUNTINGTON,

— MANUFACTURER OF —

CENTRIFUGAL ROLLER QUARTZ MILLS,

Concentrators and Ore Crushers,

Mining Machinery of Every Description.

Steam Engines and Shingle Machines.

SEND FOR CIRCULAR.

213 FIRST STREET.

SAN FRANCISCO, CAL.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

**IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS**

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all
Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than
can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long
distances with small loss, and is now extensively used in
all parts of the country for generating both power and
light.

APPLICATIONS

Should state amount, and head of water, power required,
and for what purpose; with approximate length of pipe;
also, whether the application is with reference to *Wheels*
or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given
amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of the form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and
Lead Ores and Sulphurets.

— MANUFACTURERS OF —

BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND
CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of
Assayers, Chemists, Mining Com-
panies, Milling Companies, Pros-
pectors, etc., to our full stock of
Balances, Furnaces, Muffles, Crucibles, Scor-
fers, etc., including, also, a full stock of
Chemicals.

Having been engaged in furnishing these ap-
plices since the first discovery of mines on the
Pacific Coast, we feel confident from our experi-
ence we can well suit the demand for these
goods, both as to quality and price.
Agents for the Morgan Crucible Co.,
Battersea, England. Also for E. G. Dennis-
on's Silver Plated Amalgam Plates. The plates
of this well-known manufacturer are thoroughly reli-
able, and full weight of Silver guaranteed. Orders taken
at his lowest prices. Our Illustrated Catalogue and As-
say Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

O. A. LUCKHARDT, Manager.

ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the
most suitable Process for Working Ores.

Special attention paid to Examinations of

Mines; Plans and Reports furnished.

METALLURGICAL WORKS.

318 Pine St. (Basement),

Corner of Leidesdorff Street, - - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my
Process.
Assaying and Analysis of Ores, Minerals and Waters.
Minerals Examined and Reported on.
Practical Instruction given in Treating Ores by im-
proved processes.

G. KUSTEL & CO.,

Mining Engineers and Metallurgists.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten
iron used. Only genuine Russell iron in Quartz Screens.
Planished iron screens at nearly half my former rate.
I have a large supply of Battery Screens on hand
suitable for the Huntington and all Stamp Mills, which I
will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving
and Shot Screens, Stamp Batteries and all kinds of Min-
ing and Milling Machinery. Iron, Steel, Copper, Brass,
Zinc and other metals punched for all uses.
Inventor and Manufacturer of the celebrated Slot Cut
or hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 16 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

21 & 23 First St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Jan. 16, 1890.

Clear weather the fore part of the week encouraged the trade in the opinion that distributive trade would soon set in, but this has been dispelled by heavy rains at the close. Although merchants, manufacturers, and business men in general are discouraged over the present situation, yet they look forward to a more prosperous year than enjoyed for several years past.

Money is growing easier, with the general impression in financial circles that there will be more ease within a short time than at any time in last year.

The uncertainty regarding what action Congress will take on the silver question is at present a disturbing element in the silver market, which very naturally has its effect on silver mining.

MEXICAN DOLLARS—Liberal stocks and a light demand cause a weak tone. With the spring months a freer demand is looked for. The market has held fairly steady at 75 3/4 to 76 throughout the week.

Mexican dollars closed to-day dull at 76 1/2 cts. asked from first hands.

SILVER—In the local market prices have ruled at New York prices, owing to a light export demand. The Mint is in the market and cleans up supplies fairly well. Yesterday (Wednesday) the market moved up to 97 cents in sympathy with an advance in New York and also abroad. Higher prices for silver were generally based upon the influences heretofore given in these columns. It is reported by telegraph that Secretary Windom is drawing up a bill based on his last report to Congress on the silver situation. It is claimed that he will make a few well-timed changes with a view of making his position still more acceptable to both mono-metalists and bimetalists. It is asserted that the latter are drawing more closely together in favor of free coinage of silver, and failing to get it this session of Congress will insist on the monthly purchases of silver being increased to \$4,000,000.

Cables came through to-day quoting silver in London strong at 44 1/2 d. On this basis, with today's prices for sterling exchange, our market ought to be very near 98 cents. Export buyers quote 97 1/2 cts.

QUICKSILVER—The market is quiet at quotations. Receipts the past week aggregate 146 flasks, and exports by sea 218 flasks to Mexico.

BORAX—Receipts the past week aggregate 300 cts, and exports by sea 25,745 lbs. to New York. The market is steady, with a continued free demand from the East.

LIME—Receipts the past week aggregate 2586 bbls., and exports by sea 350 bbls. to Honolulu. The market is quiet at steady prices.

LEAD—The market is reported essentially unchanged. There is no denying but that there is an uneasy feeling in the market due largely to the uncertainty regarding congressional action in Mexican lead ores. A leading New York paper says that the administration is quietly at work furthering our trade relations with Mexico. That country, in return for the simple establishment of a liberal policy toward her lead-ore product, is willing to open exceptional privileges to this country for her manufactured products of iron, steel, textiles and other articles in the long list of exports of the United States. This Government could afford to pay a bounty to the lead as proposed for the sugar producers, rather than have this single item interfere with the enormous trade which the United States would thus acquire with Mexico. And without some such evidence of friendly and reciprocal action the market which should be opened to the United States will continue to be controlled and occupied by Great Britain and even Germany.

TIN—For spot the market is dull and heavy. Sales from second hand of B. V. plate are reported at \$4.90, and of pig at 22 1/2 and 22 3/4 c. The English market for pig is weak under continued selling pressure. Imports the past week aggregate 33,380 boxes of plate. English cables report tin plate strong and active at a slight advance.

IRON—The local market is reported strong at full prices, but the demand is still slow. The Eastern and European markets continue to be reported active and strong under free consumption. The impression prevails at the East that there will be continued activity in the market for some time to come.

COPPER—The market has held to strong prices throughout the week. Late London cables to the Iron Age report as follows: Copper has ruled strong on the support of good demand for consumption and large speculative purchases. Merchant Bar selling up to £51 17s 6d. Stocks decreased in December about 9000 tons, the greater portion of which represents sales by bankers holding the late syndicate's stock. It is calculated that French financiers have sold during the past nine months 60,000 tons. The stock of Anaconda matte is now about 25,000 tons. About 450 tons were withdrawn from stores in December. The importations of this material into England last year were 19,000 tons. A sale has been made of 1000 tons of argenteiferous Anaconda matte at 10s 6d. The stock of copper decreased last month 2500 tons, and the visible supply 1200 tons. The total supplies received in 1889 were 13,000 tons less and the deliveries 49,000 tons greater than during the previous year.

COAL—Imports the past week aggregate as follows: From Newcastle, N. S. W., 9749 tons; Tacoma, 2200; Coos Bay, 1965; Seattle, 514; Departure Bay, 2300; overland, 30; total, 4558 tons. The consumptive demand continues exceedingly heavy, and had it not been for the large spot supplies, prices would be higher. While agents for coast coals and importers of foreign are bullish in their talk, large dealers and consumers are offish and will not anticipate their wants to any extent except at concessions. As heretofore stated, the large output of the coast collieries is an important factor in keeping prices down.

Eastern Metal Markets.

By Telegraph.

New York, Jan. 16, 1890.—The following are the closing prices the past week:

Silver in Silver				
Thursday	Friday	Saturday	Sunday	Monday
90 1/2	91 1/2	91 1/2	91 1/2	91 1/2
14 50	14 50	14 50	14 50	14 50
3 87 1/2	3 87 1/2	3 87 1/2	3 87 1/2	3 87 1/2
20 50	20 50	20 50	20 50	20 50
14 50	14 50	14 50	14 50	14 50
3 87 1/2	3 87 1/2	3 87 1/2	3 87 1/2	3 87 1/2
20 50	20 50	20 50	20 50	20 50

NEW YORK, Jan. 15.—Borax is without essential change. Quicksilver is dull but fairly steady. Tin has shaded off slightly under realizing sales abroad. Copper quiet and firm. Lake ingot advanced to 14 1/2 c; spot, 14 1/4 c. Futures helped speculators. Arizona, 13 1/4 c; casting, 13 c; London cable, 50 1/2 c per lb. spot. The market is a trifle easier. Pig lead, 3 1/2 c. There was no important trade in futures.

Mining Share Market.

The mining share market the past week was only fairly spasmodically active, with hardly perceptible fluctuations in the Comstock. The dull, depressed market, with reliable private information from the mines hard to get, suggests that it is done to secure all the stock possible, preparatory to an upward move. This (Thursday) morning the market opened very dull but at fairly firm prices; after Board call prices strengthened, with Yellow Jacket, Belcher and Crown Point the leaders. In outside stocks the Tuscara was more active, with an attractive up move, followed by a 20 per cent setback. The Quijotas were dull. In Bodie there was a little more doing, doubtless due to a report current that there would be a change in the superintendent and a cutting down in the salaries of the officials, which was done at a special meeting of the directors held on yesterday. Usually well-informed parties look for still lower prices in the Bodie stock, owing to a report of the necessity of another assessment later on.

From the mines reliable private information is hard to get. The latest information confirms previously received advices of an important development in Belcher on the roof-level level when work was stopped. Work will be, or has been, commenced on the roof-level to tap the fire lower down. The ore is said to be high grade. In another Gold Hill mine a ten-foot body of rich ore was run into on an upper level, but no official mention made of it. Why it is that information of the above character is kept back is beyond our ken. It should undoubtedly receive attention from some quarter. Outside stockholders have some rights, and to keep informed on the work in the mines is one of them. The mining superintendents get large enough salaries to take time to add a few more words to their skeleton and unsatisfactory weekly reports, so as to give fuller information. A report is current among well-informed persons of a strike in one of the North End mines, but we have not been able to get the news confirmed up to this writing. Official letters received to-day (Thursday) from Hale and Norcross report higher battery assays and very important work going on in the mines. From Belcher the letter goes out of the way to mention everything except that which is wanted. From Crown Point no ore was milled, owing to the freeze-up; this caused the temporary discharging of over 50 miners. The prospecting work in the mines is still continued. From Con. Imperial an improvement is reported in the crosscuts. Overman is reported to be stopping a higher grade of ore. From the outside mines there is nothing new to report outside of official letters. The change in the superintendency of the Bodie mine is looked upon as being more favorable for that mine. The Bulwer and Standard mines are running out bullion. Private advices from the Tuscara report that Commonweath will make another shipment of bullion by telegraph soon. Owing to their size, these shipments are to be made every few days. The news from the mines is of a very promising character and augurs well for the future. From the Quijotas nothing new is to hand. The annual report of the Silver King Mining Co. is of a flattering character. Extensive work was done in last year and the mine put in position for better working this year.

THE Anaconda and St. Lawrence mines, Montana, were opened last week, but had to be closed again, as the fire is still raging in their depths. No attempts have been made to recover the five bodies known to be in the mine. It is thought the company will now either attempt to flood the mine or subdue the fire by the injection of carbonic acid gas. The latter will probably be resorted to, as the former would be difficult on account of the enormous extent of the workings and the scarcity of water.

THE Con. California and Virginia Mining Co. has placed on special deposit the sum of \$22,836, the amount due for royalty on ore extracted from the mine since suit was brought against the Comstock Tunnel Company by holders of Sntro-tunnel stock. This money will be paid over as soon as the court decides which of the litigants is entitled to receive it.

The Pittsburgh Boiler Scale Resolvent.

This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work
claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER
INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS,
PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have
tested nearly all Compounds presented to us, and this one is the only good thing we have ever used.
Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150
degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of
lime, mud, and everything that is bad. Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than
the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA,
SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who
are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for
all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby
made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth,
Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the
great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given
to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway
Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central
Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern,
Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT
THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel,
or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT }
{ PROVES ENTIRELY SATISFACTORY. }

Valuable Books On Minerals, MINING AND ASSAYING.

A Practical Manual of Minerals, Mines and Mining. Compelling suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals; and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. 8vo, 367 pages. Price, \$4.50.

✓ A descriptive circular giving the full table of contents of the above book sent free to any one who will send his address.

Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 148 illustrations. 12mo, 432 pages. Price, \$5.00.

Mine Drainage. By Stephen Mitchell. 8vo, 277 engravings. Price, \$6.00.

Treatise on Earthy and other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price, \$5.00.

The Prospector's Hand Book. A Guide for the Prospector and Traveler in search of Metal-bearing or other valuable Minerals. Illustrated. 12mo. Price, \$1.50.

Mineralogy Simplified. Easy Methods of Identifying Minerals, including those by means of the Blowpipe, by Flame Reactions, by the Spectroscope, and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henri Ertz, M. D. Illustrations. 12mo. Price, \$3.00.

Underground Treasures: How and Where to Find Them. A Key for the Ready Determination of Minerals within the United States. By James Orton. Price, \$1.50.

The Assayer's Manual.—An Abridged Treatise on the Doctrines of examination of Ores and Furnace and other Artificial Products. By Bruno Keri, Professor in the Royal School of Mines, Member of the Royal Technical Commission for the Industries and of the Imperial Patent Office, Berlin. Translated from the German by William T. Brandt, Editor of "The Techno-Chemical Receipt Book," etc. Second American Edition, edited with extensive additions by F. Lywood Garrison, Member of the American Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhüttenleute, etc. Illustrated by 87 engravings. 354 pages, 8vo. Cloth. Price, \$3.00.

A circular of 8 pages quarto, giving the full Table of Contents of this Important Book, as well as a new List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will send his address.

✓ The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

✓ Our New and Revised Catalogue of Practical and Scientific Books, 36 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for \$150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "husted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

The railroad, mining and commercial center of the new State, offers some of the best inducements for investments in

Real Estate, Mines & Mining Stock

of any locality in the Northwest. For particulars address The Evans-Terry-Clausen Brokerage Co., 41 E. Broadway, Butte, Montana.

Smelter For Sale or Exchange.

One 50-ton. wrought iron, water-jacket Smelting Furnace (30"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 23, Elkhorn, Montana.

California Inventors

Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1880. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RAILWAY PRESS, No. 220 Market St., San Francisco. Elevator, 12 Front St.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

Concentration of Ore.

A modern concentrating mill incloses a good many forms of machinery by which ores are prepared for subsequent metallurgical treatment. The operation of concentration and dressing is based on the difference of specific gravity of the mineral constituents of an ore, by virtue of which the minerals have unlike velocities in falling through water (or other medium). Water is preferably the separating medium. An improved concentrating plant, such as is made by the Union Iron Works of this city, is shown on this page. The coarse crushing of the ore is done by rock-breakers, and the "screenings" or coarse stock from the rock-breakers is further comminuted by rolls or stamps. But for this purpose rolls are preferable inasmuch as their use minimizes the amount of slimes incident to crushing.

From the rolls the ore passes into the first (largest and coarsest) of the series of five revolving screens or "trommels." The trommels are either cylindrical or conical in form. In the former class the conveyance of the "screenings" from the delivery end to the discharge end of the trommel is effected by the inclination given to the axis of the trommels. In the latter class this is attained by virtue of the conical shape of the trommels. The screenings drop through "spouts" into the jigs, which have sieves corresponding in mesh to those of the delivering trommels. The trommels have sheet-iron receiving aprons into which the ore falls after passing through the perforations of the screens. Through these aprons the ore is delivered to the next finer sieved trommel of the series.

The ordinary type of jig is a trough-shaped water-box divided into two compartments by a partition extending part way down. In some of the compartments is a loosely-working plunger operated reciprocally. In the other compartment is a fixed horizontal screen on

SECTIONAL VIEW OF MILL FOR CONCENTRATING AND DRESSING ORES.

which the sized ore is fed. The strokes of the plunger cause a pulsation of water through the sieve. The ascending current raises the mixed particles, which, in their descent through the water, arrange themselves in layers or leads.

The sorting of the "equal-falling" minerals takes place in a series of inverted pyramidal boxes called "Spitzkasten." Water is brought to each compartment from above by a pipe, which, discharging the water downward against the bottom of the box, produces an ascending current. This ascending current prevents the deposition of the lighter particles,

which are consequently carried over into the next box in the series. These boxes are so arranged as to cause a slowly flowing current throughout the series.

Where the system of hydraulic classification is more extended, a series of boxes is used under proper conditions as to size, velocity of current produced, etc., for the separation of the sands. From these boxes the slimes retained in the current goes to the slime classifiers.

When jigging is not practicable on account of the extreme fineness of the slimes, the pulp is worked on round tables, huddles, percussion

tables, Triumph and Frue vanners, etc. A sizing is effected by these machines. The larger particles (specifically lighter) being acted upon more readily by the flowing water, are carried down the incline planes and pass away as tailings, while the smaller (specifically heavier) particles remain as concentrates.

Hollow Iron Pig Patterns.

They have in use at the Durham furnaces in Pennsylvania a set of hollow pig patterns made of iron instead of the usual ordinary wooden patterns. The iron pattern is more durable and cheaper in the long run. In describing this before the American Institute of Mining Engineers, Mr. B. F. Fackenthal, Jr., says: The iron pattern is made of the best flange iron, No. 13 gauge. After the sheets have been cut to the proper size, three heats are required for flanging. At the first heat each piece is stamped in a cast-iron form, which gives the proper shape to the bottom part of the pattern, as shown in Fig. 2. At the second heat, it is flanged at *b*, as shown in Fig. 3. At the third heat, it is flanged at *a*, giving the pattern its final shape, as shown in Fig. 4. The flanging at *a* and *b* is done on a square mandril. These corners should be full and square. It now remains only to put the pattern together and put the heads or ends in. The ends are also made of No. 13 flange iron and are stamped in a cast-iron form or die by means of an old screw-punch, the iron being cut to the proper shape before stamping, as shown in Fig. 5.

These ends can be made very quickly, only a few seconds being required for the stamping. The finished end is shown in Fig. 6 and at *c* and *d* Fig. 7.

The end farthest from the sow, and marked *d* in Fig. 7, is of course put in first. The end next to the sow is then put in with the flanged part to the outside, as shown at *c* in Fig. 7.

HOLLOW IRON PIG PATTERNS.

Gold-Panning Machine.

There was teeted this morning, says the San Diego Sun, at Sanger & White's machine-shop, at the foot of Eighth street, a new invention for panning gold out of gravel that seems destined to take a front rank in the economical extraction of the precious metal. This machine consists of a long cylinder body, perhaps 18 inches in diameter and 20 feet in length, in the center of which a set of iron teeth operate after the manner of a harrow. The gravel is shoveled into this at one end, and by the time it passes to the other end of the cylinder, it has received a thorough pulverizing. Here the gravel passes out of the cylinder to a series of plates, these plates (connected with one another in terraced form) being operated by a movement which is very much after the manner of band-panning. The movement seems to quite thoroughly segregate the gold from all foreign substances, but when a small residue of gravel is left, it is carefully removed and panned out by hand. The gold from many tons of dirt after once passing through the machine, is obtained from one panning.

In the course of the experiments with this new invention, about \$20 worth of fine gold dust was distributed in about ten tons of dirt and the machine turned it all out safely again with a loss of only about five per cent, and even this loss will be easily remedied. The machine will cost about \$200, can be operated by a four-horse power engine and boiler, and has a capacity of 100 tons of dirt a day. The inventor is a miner named McDuffy from near Campo.

[The same idea has been carried out in this State years ago, the revolving cylinder, however, being much larger in diameter, and having a screw-flange from end to end, to pass the material along. It was used to work auriferous gravel, which was more or less "cemented" together.—EDS. PRESS.]

The Local Mint.

The following is Coiner Gorham's report of the coinage at the local Mint for December last, and also for the year 1889:

	For December.	Jan. 1 to Dec. 31.
Double eagles.....	\$1,341,000	\$15,444,000
Eagles.....	14,000	4,254,000
Standard dollars.....	500,000	700,000
Dimes.....		97,267

Totals.....\$1,855,000 \$20,495,267

No coins were made last July, owing to the change in the office of superintendent, W. H. Dimond succeeding Mr. Lawton. The coinage of the other months varied from \$1,390,000 in June to \$2,630,000 in August. The coinage for the year is about \$5,000,000 less than in 1888. The coinage for the past five years amounts to \$121,262,733, an average of over \$24,000,000 per annum. The San Francisco Mint was established in 1854, and the amount of coin turned out from the start to December 31, 1889, is as follows:

Gold coin.....	\$739,321,857
Silver coin.....	114,653,887
Total.....	\$853,975,744

The above is California's contribution to the world's stock of gold and silver coins.

DEATH OF EMLEN PAINTER.—Prof. Emlen Painter, president of the American Pharmaceutical Association, and one of the trustees of the New York College of Pharmacy, died of consumption at his home at Spuyten Dyvil, January 15th. Prof. Painter was born at Concord, Pa., in 1844. His parents were leading members of the Society of Friends, and Emlen was educated at the Friends' College in Wilmington, Del. He was also a graduate of the Philadelphia College of Pharmacy in the class of 1866. After graduating he removed to San Francisco in 1876, and was elected Professor of Physics in the San Francisco College of Pharmacy, and subsequently was president of the college. In July last, at the Convention of the American Pharmaceutical Association, held in San Francisco, he was unanimously elected president of the association, and two months later he was appointed to represent the State of California at a convention for the revision of the United States Pharmacopoeia to be held at Washington in the fall of the present year.

FROM A "WORKED OUT" MINE.—The North Star Mining Company, operating in this district, has declared dividend No. 5 of 50 cents a share, aggregating \$50,000. This makes \$250,000 in dividends paid by the North Star under the present management. And this mine was shut down years ago, "worked out." Yet it has within three or four years been re-opened, supplied with a hoisting and pumping plant and 40 stamp mill second to none in the State, in addition to paying a quarter of a million in dividends! Between 150 and 200 men are given employment. The Empire, Omaha and Hartery are also shining examples of "worked-out" mines.—*Grass Valley Tidings.*

DURING the month of December last there were shipped over the Eureka & Palisade railroad the following from the mines of Eureka district: Sixty tons of Richmond lead, 180 tons of crude hullion and 534 tons of ore.

Mining Bureau Museum.

Among the recent contributions to the Museum of the California State Mining Bureau are the following:

Azomite, in very large and handsome crystals, from Bisbee, Arizona, and native copper with chalcocite from the same locality; presented by D. L. Mosgrove.

Topaz from Colorado; F. E. Monteverde. Several specimens of gold and silver ores from various mines; W. H. V. Cronise.

Five specimens of gold quartz from as many different mines in Amador county, Cal.; W. Q. Mason.

Rich copper ore, Monterey county, Cal.; F. Stone.

Rich copper ore, Alaska; Dr. E. Von Hase-löcker.

Fluorite, San Bernardino county, Cal.; Jas. H. Boyd.

Specimen of good quality from a large deposit in Ventura Co., Cal.; F. S. Hall.

Placer gold of very peculiar form, Palmetto, Esmeralda Co., Nev.

Gold in limonite, Fresno Co., Cal.; J. E. Hutchinson.

Group of mica crystals, Harney Peak, Dakota; R. D. Atkins.

Copper ore and chromite iron, Fifteen-Mile House, Santa Clara Co., Cal.

A large number of specimens of gold and silver ores, etc., from San Bernardino Co., Cal.

Aragonite (onyx marble), granite and other building stones from San Bernardino Co., Cal.

Crystallized gold on quartz crystals, Lovelock, Butte Co., Cal.

Cummingtonite from near Daggett, Cal.

Asbestos from near Barstow, Cal.

Almandine garnet with crystallized magnetite, Kern Co., Cal.; A. Blano.

Chromite mica—fuchsite—Aroh Beach, Orange Co., Cal.; H. S. Goff.

Realgar in calcite, Trinity county, Cal.; J. S. Thompson.

Stream tin, Potato Gulch, South Dakota; Joseph Swett.

Asbestos, Orange River, South Africa; R. H. Jones.

Prehistoric pottery from ancient graves at Turbigo and Labano, Andes Mts., U. S. of Colombia; D. T. Hughes.

Pseudinite, San Bernardino Co., Cal.

Eight specimens Pennsylvania granites; J. Z. Davis.

Malachite, polished; John Curry.

Gold in jasper and calcite, Alford mine, San Bernardino Co., Cal.

Three fine slabs of polished marble, California Marble and Building Stone Co., Colton, Cal.; also a very handsome slab of polished aragonite.

Fine terra-cotta medallion; Gladding, McBean & Co.

Cinnabar, very rich, Prescott, A. T.; G. K. W. McNara.

Minium, Tulare Co., Cal.; M. B. Everman.

Fine specimens of Colemanite, Calico, Cal.; Mrs. Perry.

Five interesting mineral specimens from Eastern States; D. C. Stone.

Twenty ethnological specimens from San Nicholas island, Ventura Co., Cal.

Bismutite and bismuthinite with gold, Oasis, Mono Co., Cal.; George B. Terrell.

The following have been donated by J. Z. Davis:

Montmorillonite, Auburn, Maine.

Ten specimens stone axes, Santa Fe, N. M.

Pickeringite, Tarapaca, Chili.

Calcite, "hacked" with micaceous iron, Cumberland, Eng.

Aluminum, cast and wrought.

Silicified wood, section from the Arizona petrified forest, polished.

Iceland spar, fine specimen.

Pyrite, Dux, Bohemia.

Tetrahedrite, Kapuick, Hungary.

Decolizite, New Mexico.

Dolomite, Cumberland, Eng.

Limonite, Siegen, Prussia.

Brochantite, Frisco, Utah.

Marcasite, Guanajuato, Mexico.

Marcasite, Lyme Regie, Eng.

Barite, Penn.

Crystallized quartz and agate, large polished specimen.

Two very handsome specimens of onyx, polished.

Four large and very beautiful specimens of agate, polished.

Gold quartz, very rich, Peterson mine, Cargo Muchacho district, San Diego county, Cal.; Thos. E. Frezer.

LEADVILLE AND ASPEN.—Aspen's output of silver and lead during the year 1889 amounted to nearly \$7,500,000. Leadville figures up to more than \$13,000,000. The latter camp always claims everything shipped from her smelters and we presume she has done the same this year. We have not made a close estimate of the amount that Aspen furnished to the smelters of our sister camp, but during much of the time, one-half and often more than one-half of the weekly output was consigned to them. It may thus be safely asserted that nearly \$3,000,000 of the amount which Leadville claims was furnished by Aspen. Her receipts from other points must also have been considerable, and it is probable that the production of the mines of that camp did not amount to more than \$9,000,000, or about the same as they produced in 1888. The increase claimed over last year's figures is all accounted

for by the increased importations from the Silver Metropolis. We have no desire to pull Leadville down, but it is our duty to expose her when she seeks to make a strained contrast between herself and our own city. During 1890 Aspen will produce more than \$9,000,000, and unless Leadville secures a bona fide increase, she will have to yield first place to her rival on this side of the range.—*Aspen Times.*

Comstock Tunnel Company.

Theodore Sutro, president, makes the following statement of the financial condition of the Comstock Tunnel Company, December 1, 1889:

Total indebtedness, \$3,000,000, covered by 30-year first mortgage non-accumulative bonds, of which \$2,139,000 have been issued; surplus cash, \$115,000. The uncollected royalty due in October and November, 1889, amounts to about \$34,000. Gross receipts from the property (including money received from the mining companies for making certain new connections with the mines) for the 12 months ending Sept. 1, 1889, were \$261,133.02; operating expenses in Nevada (not including the cost of the aforesaid new connections) during the same period, \$88,994.32.

As regards the future, it is stated that the average receipts per annum for the three years ending Sept. 1, 1889 (including money received for the aforesaid new connections during the same period) were \$276,915.67; average operating expenses in Nevada during the same period (including cost of aforesaid new connections) were \$83,337.38. As no new connections or any magnitude with the mines are in contemplation for the coming year, it is estimated that the income for the year ending September 1, 1890, will probably be about \$265,000. The operating expenses will probably not exceed \$70,000; other expenses outside of Nevada, \$14,000, making a total of \$84,000. Net income for 1890, about \$181,000; interest on bonds the current year, \$85,560; net surplus above expenses for 1890, \$95,440; surplus available for the redemption of bonds, paying dividends and extending the tunnel at the close of the fiscal year, Sept. 1, 1890, will be about \$210,440.

The Trusts and Combines.

Continuing briefly the comments in previous issues upon the baneful power of the trusts and combines which are operating in agricultural products, we note a despatch on Jan. 13th from Kansas City, which announces that the American Live-Stock Commission Company will disband within a few days. This company was organized about a year ago for the purpose of saving members the money they were paying to commission men in Kansas City and Chicago. A hundred thousand dollars was recently divided as the first year's dividends.

A prominent member of the association says Armour, Swift and Hammond have threatened to boycott the concern in the interest of the brokers. The Kansas City and Chicago Live-Stock exchanges also threaten to do the same thing by the Chicago and Alton Railway if it continues to lease the cars of the association. Thus the great combine is killing out opposition to the middlemen who work in its interest, and tightens its grip upon common carriers, so that the public avenues of transportation cannot be available to parties outside the combine. There is a little gleam of hope that the ways of the trusts may be made hard in the depression in trust circles in New York over the injunction preventing them from changing their form to avoid recent laws; also over the decision of Judge Wallace of San Francisco. The public should congratulate itself that there are some things which promise to check the progress of these gigantic evils.

AN IMPORTANT CASE.—A case of more than usual interest has been commenced in the Superior Court by J. E. Prewett, attorney for plaintiffs, not only on account of the large amount of money and property involved, but also on account of the important land questions to be determined. The suit is to recover a tract of very valuable mining land situated near the Mayflower mine, on the Forest Hill divide, together with \$51,000 rents and profits. Judge Spear and W. H. Bullock own the mine under the mining laws, and the Mayflower Company claims it under a patent to the railroad company. The land has been known to be mineral land from 1860 down to the present, and the determination of the question will be of interest to many miners in all parts of the mining regions as to whether the railroad company can acquire a valid patent to land known to be mineral at the time of the passage of the railroad grant in 1862. The Mayflower Company is in possession of the property and is the defendant in the suit; and W. H. Bullock, Judge Spear, J. S. Rees and R. Greenwood are the plaintiffs.—*Placer Republican.*

THE MINERS' UNION in Virginia City has elected the following officers for the first six months of the ensuing year: President, Michael J. Owens; vice-president, Daniel McFadden; recording secretary, M. Norton; financial secretary, Bernard Coyle; treasurer, C. E. Mack; conductor, Jerome Quinlan; warden, W. B. James; Library Directors—Michael Carroll, Henry Hatherell, Levy Atkinson, James Donworth, Peter Malloy; Finance Committee, John Finnegan, M. Abrams, T. W. Flynn.

Drugs and Doctors.

It was the remark of the celebrated Dr. Boerhaave that the physicians in his day were like a blind man armed with a club; they raised the club and struck; if they hit the disease they killed it; if they hit the patient they killed him. It is surely a matter of gratification that human life and health in our day are subject to no such blundering and uncertainty. Dr. George M. Gould in the December number of the *Forum* speaks almost rapturously of the wonderful advancement medicine has made as a science. He says: "If one thoroughly conversant with the medical progress of the last few years takes up even the best work on pathology or general medicine issued five or ten years ago, he is astonished to find how much seems old and outgrown." He states it as a fact that the death rate in England from zymotic diseases had been reduced one-half, and in the class called fevers within the past 20 years the death-rate had been reduced from 20,000 to 5873.

While we willingly acknowledge the debt of gratitude we owe the medical profession for their tireless energy in improving the healing art and its handmaid, sanitation, still there are many of the profession who are very skeptical, if not pessimistic, in their estimate of power over disease. Dr. Holmes once made the remark that if the whole *materia medica* were cast into the sea, it might be worse for the fishes, but would certainly be better for man. Dr. George K. Weloh of Keyport, N. J., in an address before a medical school on "Many Drugs for Remedies," gives a very sad and graphic description of the helplessness of the average doctor in the presence of disease. He says: "Where is the young doctor who does not believe in the magic of drugs, and the old doctor, if he is a wise man, who does not look upon the most of them as mischievous, and the minority as deserving of restriction? The pathologist is skeptical of them all. Do we waiting behind the eye of Koch know anything of tuberculosis or believe that he does? Does not the ravage go on? And who has won eminence in our yellow fever? Are men no longer in dread of the cholera? Who ousa rheumatism or chronic Bright's disease? And where is the stout heart that never failed before the patient burning and broiling in the horrible slow flame of pyæmia?" Stille and Mairorb's dispensatory gives a list of 150 remedies for rheumatism, from grandma's teas and fomentations to the latest specialist with 40 grains of salicylic acid to the dose. And what is true of rheumatism is largely true of all other diseases. There are many drugs but few remedies.

That medicine is not an exact science, nor likely soon to be, is evident from the great uncertainty of diagnosis. There are very few diseases whose signs and symptoms are so constant that no mistakes can be made, and no fact is more notorious than the almost daily difference of opinion among doctors.

Of course the first thing to decide on entering the sickroom is, what is the matter. To fail here is to fail in practice, and hence the ability to diagnose is the surest test of real medical genius. Most any one may prescribe when it is known what is the trouble, and the ability to diagnose is by no means an acquired talent, for in that case the doctors would all be nearly of equal merit. They all read and study the same books. They are generally well posted in anatomy and physiology. They all look at the tongue, explore the pulse, go through the process of auscultation and percussion. But in opinion and practice it is well known they often go widely of the mark. However valuable the schools may be, the fine insight, the acute, delicate and quick perception that characterizes the superior physician, is something that cannot be found in the books or transmitted through a diploma.

We suspect, however, that one cause of so many mistakes in the treatment of disease comes from the fact that the physician is too hasty in making up his mind. Here the patient is usually largely to blame. He expects the doctor will be able to tell him what is the matter on the first visit, and the doctor is afraid to frankly state his doubt and take time more thoroughly to study the case. The patient may grow alarmed and send for some one else. But were all physicians equally careful and cautious, their patients would soon learn not to expect the doctor to jump to a conclusion at the first visit.

But passing all this by, we can hardly agree with most doctors in regard to prognosis. While quite free in making a diagnosis, they are usually very reticent on prognosis. Now the knowledge of an incurable disease does not aggravate the malady nor hasten its progress, and surely one who is approaching his end has an indefeasible right to know it. The matter may require prudence and wise caution, but we have seen so much horror thrown around the deathbed by delusive hopes that we cannot regard such a course as anything less than inexcusable sympathy, if not absolute cruelty.

CIGARETTE SMOKING.—So serious a detriment to health has cigarette-smoking become in Frankfurt, the capital of Kœnigreich, that the Governor made special reference to it in his late message, and the city authorities have followed up the matter by passing an ordinance forbidding the sale of cigarettes in that city.

The Martin White Suit Ended.

After many years of long and wearisome litigation, the celebrated Martin White mining case was dismissed in Judge Lawler's court last week.

The suit had its birth in the old Nineteenth District Court, and the bundle of dusty records tied up with a string is all that is left of this famous suit.

Like "Jarndyce vs. Jarndyce," told of in Dickens' celebrated *Bleak House*, many of those who had an interest in its final result have long since become dust.

The suit was brought by Martin White against Annis Merrill, John A. Hooper, F. B. Hooper, E. D. Sawyer and Geo. C. Hickok. The Martin White Mining Co.'s mines were located at Ward, in Nevada, and the capital stock of the company comprised 100,000 shares, of which, on the 28th day of April, 1877, White claimed to own 58,625. His suit was brought against these men as shareholders to recover

the current year, with an encouraging probability that a return to 50-cent dividends will be recorded before its expiration. The payment of this last dividend aggregates a total of \$3,358,300 disbursed to shareholders during the past three years out of the ore discovery made in 1886, and a total of above \$80,000,000 disbursed from bullion realized from ore extracted from the ground included in the Cons. Cal. and Va. boundaries since the discovery of the first bonanza in 1874.

CALIFORNIA'S WEALTH OF GOLD.—"The gold in your soil is not by one-tenth exhausted," said an English mining expert to a reporter in the Palace hotel. "Your mining industry is as yet in its infancy, and half that you produce you let go to loss. Now, I have just made an inspection of certain mines in behalf of an Eastern company, the locality of which I will not tell you, as I am not advertising any section of this State, nor any particular mines, and my journey carried me pretty well all over the mining counties of the State, both north

In a Flower Garden.

Our engraving presents a photographical view in a well kept Kern county garden located on Greenfields Ranch, as the property is appropriately called. The situation is about ten miles south of Bakersfield, and the ranch is one of the several belonging to Haggin & Carr, and the view represents a part of the ornamental horticulture which surrounds the superintendent's cottage. In the foreground, the large circular bed is planted with geraniums and pink arranged around the fan palm in the center. To the right is a large locust tree, up the trunk of which a Cherokee rose has grown, reaching nearly to the top of the tree, forming, when in bloom, an immense bouquet nearly the size of the tree itself. Upon the left is an end view of the cottage, with its veranda opening into a long grape arbor which extends to the building, the roof of which is seen in the distance. Upon the veranda is Bevis, the faithful

COMSTOCK TOTAL BULLION YIELD.—A correspondent is informed that in estimating the total bullion yield of the Comstock lode from its discovery to date at \$500,000,000, the estimate includes bullion realized from the working of ore tailings. The estimate also includes the bullion realized from ore extracted from mines operated on individual account, of which no record of the exact amount is obtainable. Following is a statement of the bullion yield of some of the principal mines on the Comstock lode: Ophir, \$20,000,000; Savage, \$16,500,000; Hale and Norcross, \$13,500,000; Chollar and Potosi, \$21,000,000; Gould and Curry, \$15,500,000; Yellow Jacket, \$16,500,000; Crown Point, \$24,000,000; Belcher, \$30,000,000; Overman, \$4,500,000; Imperial, \$2,750,000; Kentuck, \$11,500,000; Con. Cal. and Virginia, \$123,000,000.—*Virginia Chronicle*.

PROGRESS OF THE IRRIGATION SURVEY.—The report of the Irrigation Survey for the month of November, lately received by the Secretary of the Interior, states that field-work was car-

GARDEN SCENE ON GREENFIELDS RANCH, NEAR BAKERSFIELD, KERN COUNTY.

\$68,000 and over for money he had advanced the mine from time to time.

Then the causes of the trouble go on through a thousand pages of legal oap, in which White attempted to show that the mine was in debt, and that was the reason why he advanced the money. When asked why he did not allow an assessment to be levied to defray these expenses, he replied that when he asked his friends to hny into the mine, he represented that it was so rich that there would never be any need of an assessment, and after telling them that, said White, "I had rather be at a personal loss than that they should be punished with assessments."

Why the suit was dismissed does not appear, nor does Judge Messick, who has grown gray in the long weary years of its trial, care to tell.

CONS. CALIFORNIA AND VIRGINIA.—The January dividend of \$54,000 by the Cons. Cal. and Va. mine is the 32d dividend declared by the company since its incorporation under the present title in January, 1886. The first was 30 cents per share, the following 30, 50 cents per share, and the present is the first of 25 cents a share. The prospect is favorable that monthly dividends of 25 cents per share will be declared by the company throughout

and south; and I will freely state to you that my reports were of a favorable character. Why, there are thousands of dollars of Eastern and English capital waiting for an opportunity to find investment in California, which has been scared off by the land boom, but which could be induced to come into your mines if you would only show some enterprise yourselves. But I must say that some of your means of working out gold belong to an antediluvian period, and your miners are frequently in the habit of allowing their sulphurets to run to loss instead of saving them. Now, with the introduction of new machinery and the use of an improved style of mining, I predict that your mines will produce as much, if not more, than your grain-fields and orchards. Your mines are not by any means exhausted and are to-day, in my opinion, the best property any one could invest in."

The Federal Land Office at Sacramento has decided in favor of the claim of John B. Hobson to Iowa hill. This needs confirmation by the General Land Office.

The Automatic Can Machine Co. has sued the Pacific Can Co. for infringement of patent on a machine for plating and soldering heads in cans.

ful watch-dog of the ranch, and just beyond his figure is the trunk of the weeping willow whose graceful branches are seen above the grape arbor. This willow is but 12 years old and has a trunk six feet in circumference. The picture is quite suggestive of the quiet and warmth of the California valley in summer-time—a good place for a day dream, or, as its products show, a good place also for industry, as the heart of man is inclined.

ANTI-TRUST BILL.—On the 14th inst. the Senate Committee on Finance considered Sherman's bill to declare trusts unlawful. After adopting several amendments, which do not affect the principle or scope of the measure, the committee ordered a favorable report to be made to the Senate.

The State Board of Prison Commissioners have decided to establish the new Preston Home of Industry on land purchased from the Lone Coal and Iron Co., half a mile north of Lone, Amador county.

NOTWITHSTANDING the comparative inactivity of the Richmond and Eureka Con. Companies, says the *Sentinel*, the prospects of the camp are brighter than could have been expected a year ago.

ried on in California, Nevada, Colorado and Idaho. In the California and Nevada section parties have finished the work assigned to them. The topography of 250 square miles of Pyramid Peak sheet area in California and the Reno sheet area in Nevada was completed. The report of the Hydrologic division was pursued only in California and the Rio Grande valley, New Mexico. In California, examinations were made of a segregation of irrigable lands in the valley of Owen's river. The Hydrographic party inaugurated some experiments in California for gauging rivers by means of an apparatus worked from shore. A camp is being located on Tuolumne river.

HAND-PAINTED TEXTILES promise to be very popular this year in holiday goods. The latest improvement in this class of decorative work is a process by which the colors are laid on with a pen in place of the heretofore inevitable brush. Very delicate shading is produced by the new method.

It is estimated that Philadelphia in fighting the "grip" consumed 2,000,000 quinine pills, weighing about a ton, in ten days. If other cities swallow quinine at the same rate, a scarcity of the drug is more imminent than an ice famine.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

[Owing to the prevailing snow-blockade on the railroads, we are this week without our usual exchanges from Nevada, Utah, Idaho, Mootana, Oregon, Washington and portions of California, which will account for the absence of current mining news from those places.—EDS. PRESS.]

CALIFORNIA.

Amador.

SOUTH SPRING HILL.—*Ledger*, Jan. 18: It is pleasing to be able to report that this mine—unquestionably the best bullion-producer in the county to-day—is looking better than ever. Judging from all appearances it has a long career of prosperity before it. The ore body is large and of excellent grade, and the property is ably managed by John R. Tregloan, the superintendent, to whose judgment the development of this grand mine is mainly due.

MISCELLANEOUS.—R. M. Ford was in Jackson the latter part of last week, delivering stock of the North Gover Improvement Co. to the subscribers, and collecting the two cents per share on the same. A carload of concentrator machinery arrived at the depot Wednesday, consigned to the Amador gold mine, at Jackson. There is now about 40 tons of machinery at the depot for this mine. The ten stamps of the Sutter Creek mill are now running steadily, the usual amount of ore being milled daily. The company will open their main tunnel as soon as supplies can be hauled in.

SUTTER CREEK.—The mines are now running along quite smoothly on account of the excellent condition in which the Amador canal is kept. The Lincoln mine has met with an interruption on account of losing the vein. They will run a crosscut, and expect to strike the ledge again in a few days.

Calaveras.

WAITING TRANSPORTATION.—*Calaveras Prospect*, Jan. 18: We hear that 500 tons of mining supplies and 30 tons of coke for Copperopolis are now at the Milton warehouse awaiting transportation to the mines.

SHEEP RANCH MINE.—Two large wire cables for the Sheep Ranch mine were brought into town on Saturday evening last by teamsters Javeaux and Bryan. The cables weighed 200 pounds each, and were both put upon the reels at the mine on Sunday, the 12th inst. The water having been sufficiently reduced, operations were resumed with a full force of men on Monday. The animated puff of steam and the renewed rumble of the stamps at the mill are cheering sounds to all. Our people had begun to predict a long and dull season of inactivity for our village.

THE UTICA MINE.—*Mountain Echo*, Jan. 16: Work is being prosecuted in the stopes running north and the mill is kept in operation crushing ore taken from that part of the mine. The work to recover the bodies of the dead miners is progressing in the south end, but owing to the broken up and dangerous condition of the ground progress is that direction is necessarily slow. Nothing new has been developed during the past week and the dead miners still slumber in the position in which the death-dealing cave has laid them. As we stated several weeks ago, it will be many weeks and perhaps months before any of the bodies can be recovered. Nevertheless the public and the friends of the dead have the consolation of knowing that the company is doing its whole duty in the matter.

El Dorado.

GULCH CLAIMS.—*Placerville Observer*, Jan. 21: Everything is still quiet among the various claims in the county, save in one or two of the large, well-developed mines. The cold, stormy weather, with a heavy snowfall, has stopped all outside work of every description, and but little work can be done in the developed claims that are not well housed in. All mining ditches are frozen up at their heads, and water is scarce. It was hoped by all miners that the big storm had ended, and that warm, thawing weather would follow, giving plenty of water for milling and gulch work. There are a great many good gulch claims yet left in the county, remote from water-courses, which can be worked only in a season of abundant rainfall, such as the one upon us this year. Every ravine or swag where a head of water could be obtained had its busy miner some time back, and the prospects were for a large aggregate clean-up from this source throughout the county; but freezing weather came suddenly, and has lasted well, with the result that the water is checked and gulch claims are idle awaiting a thaw, which now appears to be remote.

EL DORADO.—The most important news of the week among the mines is from the old Church mine, now known as the El Dorado, situated in El Dorado mining district, adjoining the famous Springfield mine from which Hayward, Hobart and Poundstone have realized such a fine fortune in years gone by. The El Dorado mine was purchased a couple of years ago from G. G. Blanchard of this city, by Ex-Governor Perkins, Jacob Neff, W. H. Brown and others, who believed they secured a fine property. The mine had lain idle for a number of years with but little development work done on it. The new owners began prospecting it in a systematic manner, employing as their superintendent one of the best practical miners on the coast, Mr. Richards, formerly with the Hotelling Iron Co. at their mines in Placer county. They began a new shaft, striking good ore at once, soon erected a mill, crushing a large amount of rich rock. About a year ago, having prospected to their satisfaction, the company determined to put in a thorough system of works, at the same time putting the mine in the best shape possible for working. They have accomplished during the past summer and now have works not excelled by any mine in the county. Their new double-compartment shaft is a model in every particular and adapted to the expeditious handling of a tremendous amount of ore. The shaft is now down about 550 feet with about 50 feet more to go on the present contract, the job of sinking having been let in contracts of 200 feet each. The shaft was started considerably east of the lode, which dips east, and it was expected to cut the lode at a good depth and then test its worth as compared with the surface

rock. During the past week at a depth of a little over 550 feet the contractors struck the vein, which was found to be seven feet through of fine rock, free-milling and rich. This magnificent ore body of rich material is a bonanza for its owners, and shows almost conclusively that the El Dorado is one of the richest mines in the State. It has heretofore had the name of being one of the finest properties in the county, and has done for its owners what no other mine in the county has done, and what can be said to be true of few mines in California—namely, it has paid its way from the start and paid handsome dividends besides.

VARIOUS CLAIMS.—The news from the El Dorado this week is not only good news for its owners, but for every mining man in the county. For several years past El Dorado county has been looked at suspiciously by men of capital inclined to invest in mines, from the fact that a great many men had taken hold of claims only to give them up after putting considerable money into them. This was looked upon as a suspicious circumstance, and the failures were of course attributed to the fact that the mineral was not here, rather than to any failure of management or a proper development of the claims taken hold of. The few claims that have been well developed in the county show conclusively that the mineral is here and stays with depth. There are the Montezuma at Nashville, the McNulty, El Dorado and Springfield at El Dorado, the Mount Pleasant at Grizzly Flat, the Kelsey at Kelsey, the St. Lawrence at Louisville, the Taylor at Garden Valley, and others, all mines that have paid handsomely and have been well developed. All but the Mount Pleasant at Grizzly Flat are on the well-defined Mother Lode belt, showing that pay rock is to be found along the entire belt, from the famous Keystone in Amador to the rich and unfailing mines in Nevada county. Most of these claims have been taken hold of by numerous individuals and companies and as often abandoned as worthless, like many other claims in the county; but it is a noteworthy fact that such of these claims as have been taken hold of by men of experience, with thorough and competent men to manage them, have proven to be immensely rich with depth and have paid large fortunes into the pockets of the undaunted owners. The developments in the El Dorado have added point to these remarks, for the El Dorado is a mine that has passed through varied experiences, was generally considered of no account and was bought by the present owners for a mere trifle. Yet by judicious management the hidden wealth has been unearthed and dividends have been paid while prospecting the claim and erecting buildings and machinery, and the mine placed in the front rank of the rich mines of the county.

Nevada.

THE "TIE-UP."—*Fidings*, Jan. 14: The situation at the mines is unchanged, but the "tie-up" will not be of long duration. At the Idaho only the pump is in operation, by water-power; steam is running the Empire pump, and water the North Star pump. The mills and miners are idle, save that at the North Star the machine drill operators and contractors are at work. Steam is operating the Hartley machinery, but the mill remains idle. Water from Wolf creek is being utilized at the Omaha, and it is expected to start up the mill this evening with power from the same source.

OMAHA MINE.—*Grass Valley Union*, Jan. 21: The Omaha mine has not been interrupted in its operations and its eighteen stamps have been pounding away through the whole of the storm siege, while all the other stamps of the district are idle. The company fell back on its former plan of taking water from Wolf creek to run the big Pelton wheel and has thus been able to continue with but brief interruption.

FILLED UP WITH SNOW.—*Grass Valley Union*, Jan. 19: No news from the South Yuba Canal, as to its condition, but it is supposed to be filled up with snow, which may have to be shoveled out before water-power can be furnished to the mines of this district. The miners have before them an indefinite season of idleness.

Placer.

TOO LATE.—*Placer Herald*, Jan. 18: According to W. Hill, Grant Van Vactor was a month too late in starting to put up his machinery at Canada Hill. He succeeded in getting his cabin built, but the timbers and lumber for the mill and the machinery are lying under 25 feet of snow. The mortar was set and the gallow-frame was up before the storm began.

CHANNEL.—John Schipman has a valuable claim on New York Canyon and estimates that he will have to run his tunnel only 75 feet further to tap the channel.

San Diego.

A DANDY PROSPECT.—*Julian Sentinel*, Jan. 17: The new 20-stamp mill at the Stonewall mine is expected to be put in operation by the first of next month. It will be a dandy mill, on a dandy mine, and we suspect it would take a dandy pile of cash to buy it. There are other dandy mines in these mountains, too, the Ready Relief for instance, but then, it is not owned by a governor.

Santa Barbara.

BEACH MINING.—*Lompoc Record*, Jan. 12: There are now at work in the beach mines five companies, all doing well. There is nothing fabulous in these mines, but it is demonstrated that it pays to work them. There seems to be no exhausting a claim. With each recurring tide the mines are surcharged with gold so that practically the mines are inexhaustible. For months the same ground has been mined over, week after week. The opinion prevails among the miners that this fine gold is carried along in the Japan currents which are known to touch the coast above Point Conception at the point where these mines are the best. It has been suggested that by the use of a dredging machine gold in much larger quantities might be secured.

Sierra.

GRAVEL.—*Mountain Messenger*, Jan. 11: The Wide Awake Mining Co. has struck gravel in its new main tunnel, and expects to take out pay-dirt by next spring. The company has, in our opinion, one of the best gravel claims in this county.

Shasta.

CLOSED DOWN.—*Courier*, Jan. 18: Wm. T. St. Auburn, Supt. of the Niagara mine, French Gulch, was here Thursday, and went on up to French Gulch to close down the entire works on account of

the weather, and until a more favorable season of the year.

MORE STAMPS.—*Redding Free Press*, Jan. 16: The Gladstone M. Co., French Gulch, will add immediately ten stamps to their 12-stamp Paul battery, making 22 stamps, and a capacity of 45 tons every 24 hours.

Tuolumne.

TOO HARD.—*Independent*, Jan. 18: The men who took the contract of sinking the Bonanza shaft at \$14 per foot have quit, as they could not make it pay, owing to hard ground. The company have now taken hold of the work themselves, and are operating Burleigh drills.

EUREKA.—*Sonoma Democrat*, Jan. 18: The Eureka mine at Summerville is being reopened and further developed after many years' cessation of work. Hayward & Hobart are the owners of this property, and it is a valuable one. It is situated north of the Dead Horse.

NEVADA.

Washoe District.

HALE AND NORCROSS.—*Virginia Chronicle*, Jan. 14: A body of ore, in some places two timber sets (12 feet) in width, is developed on the 1200 level in the Hale and Norcross mine. Car samples of this ore show an average value of \$35 per ton. This ore is the upward continuation of that developed nearly three years ago on the 1300 level. At that time a winze was sunk on the ore, but it proved too narrow to extract and convert into bullion profitably. The streak was followed north and south with lateral drifts, and a raise driven into it above the south lateral drift showed no improvement in width. A north raise was recently made in the ore above the 1300 level, following the strike of the vein, which led to the development mentioned above. The fact that it has steadily widened as it was followed upward, indicates that a much greater breadth will be found in raising on the vein to the 1000 level.

OPHIR.—*By Telegraph*, Jan. 18: On the 1300-foot level, from the end of the east crosscut on the shaft station, a south drift is advanced 225 feet from the end of the east crosscut, 316 feet from the shaft station, continuing in porphyry, mixed with quartz, showing value.

CON. CAL AND VA.—From the stopes on the 1300, 1435, 1500, 1600 and 1650-foot levels the ore yield during the past week has been almost entirely suspended on account of the ore side tracks being blocked with snow. The men employed on the ore stopes are temporarily laid off for the same reason.

SAVAGE.—Explorations are progressing as usual on the 400, 560 and 600 levels. Ore shipments are temporarily suspended.

HALE AND NORCROSS.—We shipped to the Nevada mint during the week 537 tons of ore. The falling off is due to the snow blockade of the ore-house side track.

CHOLLAR.—We crushed 210 tons of ore during the week, showing a pulp assay value of \$25.50 per ton.

BELCHER.—The 850-foot level east crosscut is in porphyry, showing streaks of quartz. The 200-foot level east crosscut is still in low-grade quartz.

SEG. BELCHER.—Ore buoches are still showing in the 1200-foot level drift from the winze.

IMPERIAL.—West crosscut No. 1, on the 500-foot level joint Confidence-Challenge drift, is still in quartz and porphyry. West crosscut No. 2, on the 300-foot level, continues to show bunches of ore.

OVERMAN.—We have opened the 1200-foot level preparatory to stripping ore near the Seg. Belcher mine.

ARIZONA.

TOMBSTONE DISTRICT.—*Prospector*, Jan. 16: There is a satisfaction in knowing that a crisis is approaching in Tombstone's history—that longed-for period when something will have to be done toward pumping out the water, or a virtual abandonment of the mines that are the big producers of the camp. There is no disguising this fact even on the part of the owners themselves. The Coontention folks are putting up \$20,000 per year to keep their works and mine in shape. This has been a matter-of-fact during the three past years, and that company has expressed a flat-footed flat that they will not continue to pay out money any more without some resulting benefits. The Grand Central Co. are feeling in the same mood as regards their properties, which will soon be in shape to hang up unless a deep working proposition is made and accepted. In Tombstone district and vicinity very little has been done of importance. The Comet is shipping 600 ore at present, but sinking is progressing rapidly. The Herschell is producing good ore in the north end. Ritter struck a very rich pocket during the week in the Sunset. Some of the ore that he brought in is half metal. A contract was about to be closed with the Sterling mill for the working of 3000 tons of ore from Turquoise district. It is understood now, however, that the deal was not consummated.

MOHAVE CO.—MINER. Jan. 18: The lessees of the Rural mine have made another strike of good ore. J. P. Finegan, is working a force of men on a claim below the Itasca and is taking out some fine ore. Garcia & Jimenez have about 18 inches of fine ore on their gold claim near the Connor mine. P. H. Leddy struck a fine-looking prospect last Sunday near Mineral Park, which shows wire gold in the croppings. T. A. Murphy is working a claim near the Tuckyho which shows up an ore-bearing streak 8 inches wide, which assays 10 ounces in gold and 12 in silver. Henry P. Ewing has on the dump of the Tuckyho mine about eight tons of high-grade ore. The Esmeralda mine, near Cerbat, at the depth of 115 feet shows up a three-foot ore body, which assays 70 ounces in silver and 20 ounces in gold per ton. The Rattan mine has been closed down temporarily, awaiting the erection of a mill for the treatment of their ores. The company expect to have the mill ready for operation by May. In Gold basin operations will be commenced at an early day by the O. K. mining company. Water pipe sufficient has been purchased to lay six miles of pipe line. A mill will be put up, and it is expected that the mines and mill will be in operation by the first of May. An additional flow of water was struck at Patterson's well recently which insures plenty of water.

MINERAL PARK.—A gentleman from Mineral Park gives us the following notes in regard to ore

now on the dumps and awaiting shipment at the various mines in that place and Chloride: Coon & Son on the Sabbath Bell have a fine lot of ore for shipment. Erin Sherman has about 20 tons of ore ready for shipment from the Raibow. The Queen Bee, Park & Henson, have 100 sacks of ore on the dump awaiting the big team. Durden & Frolich have a lot of ore from their new claim in Chloride ready and expect to ship a carload. McKinnon & Kostar have a carload of ore on the Atalla dump ready for the teams. This ore carries a large percentage of copper. E. F. Thompson has about 30 tons of ore on the Empire dump, awaiting shipment. This is high-grade ore and will net a handsome sum.

BRITISH COLUMBIA.

ALLUVIAL DIGGINGS.—*Victoria Colonist*, Jan. 11: Prospectors in the Chilcoten country, about 150 miles direct east from Soda creek, have discovered alluvial diggings which give promise of turning out well. Three creeks were prospected, and from each excellent prospects of gold were secured, although the ground has not as yet been properly opened up. The men who have visited the region are confident that they have a rich find. The creeks are on the western slope of the coast mountains, and empty their waters into Bute inlet.

DAKOTA.

SYNDICATE SMELTER.—*Deadwood Pioneer*, Jan. 11: Syndicate smelter blew in yesterday for a two-weeks' run on ore from the Ross-Haoohal, Isadorah, Double Standard and Toronto. Until the run is completed results will not be known, and they will not even then if the same secrecy is preserved that has marked the policy of those having the experimental plant in charge to the present time.

AN IMPORTANT DEAL.—Some months ago mention was made of the fact that Patrick Killoreo and Stephen J. Breyer had struck a body of very excellent silver ore on certain locations they made on Jim creek. Several claims were located and they are now known as the Calihogo group. Killoreo and Breyer at once went to work developing the property; work met excellent results, what was apparently barren ground only a little while before began developing into mines of more than common value. Certain Lead City parties learned the facts and became interested. Among them was Ernest May, who through Judge Rhinehart negotiated a 90-days' bond on the property for a good round sum, of which \$1500 cash was paid at the time. The bond is just about expiring, and Breyer, one of the owners of the claims, in town last night, stated to a *Pioneer* reporter he had no doubt conditions of the bond will be fulfilled within a day or two and the property purchased. The Calihogo ore carries a large percentage of lead, an element hitherto scarce in the Hills, and until the pyritic process was found applicable, essential to smelting our ores. When the sale is consummated it is believed parties purchasing will at once begin working the mines on an extensive scale, put up a large plant and regularly turn out bullion.

FLOAT.—Considerable interest is felt in the test run being made on the Glendale tin mine near the Etta, by one of Gates machines. If it is successful, one or more will be ordered for Nigger Hill mines. The machines only cost \$2500 on hoard cars at Chicago, and it is hoped that it will be a success.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, Jan. 12: Business at Alamo has been quieter than usual for a week or two past, owing in a great measure to the heavy rains which have fallen in that district, effectually putting a damper on any progress being made in the various mines. Twenty-eight inches of rain is said to have fallen, and it will do good in disclosing various placer diggings which exist in that locality. The Lane mill is the only one in operation at present. This mill crushed 10½ tons of ore from the Asbestos mine the latter part of last month, which yielded \$525. This is a high average and sustains the good reputation of the Asbestos. Feliciano Aldrete has bought a half-interest in the Todos Santos mine, southwest of the Tarantula. It is pronounced a rich mine. Fifty-four tons of Aurora ore run \$40 per ton in Lane's mill a few days ago. Judge Kerr has sold his half-interest in Lane's mill to J. M. Gonzalez, and the Judge intends to put up a Wiswell mill of his own in camp. Major Geo. B. Zimleman, of the El Paso M. M. Co., went out to Alamo Tuesday, accompanied by Mr. Charles Dobler, an experienced miner, who will hereafter superintend the El Paso Co.'s several mines and mill. Major Zimleman states their mill will soon commence on 500 or 600 tons of ore now on the dump from the Avalina and El Paso mines, and that they intend to push their work. Judge A. J. Reeves, of the Liberty Mining Co., whose mill is located at Santa Clara, in Mexican Gulch, has been in town nearly a month waiting for the roads to become passable in order to bring lumber from Tabeta to inclose their mill and make other improvements. The heavy roads and rainy weather have prevented them from doing any work whatever. The International Co. has let contracts for sinking shafts 4 by 8 feet, and 50 feet deep from the surface, to be well timbered, on the Grande and Penelope mines; and also for a shaft 50 feet deep from the surface and 4 by 5 feet in size, to be well timbered, on the Spider mine.

NEW MEXICO.

THE ECLIPSE.—*Kingston Shaft*, Jan. 11: Development upon this mine is being pushed ahead by Sup't Rencher. Four men are employed.

THE GRAY HORSE.—The ore bodies on this mine show up as good as ever. The vein is being stripped, and systematic explorations inaugurated.

THE ILLINOIS.—This "Old Reliable" retains a full force of men, and continues to produce regularly. It is presumed that the Illinois now has a continuous pay streak of ore for a distance of over 300 feet.

THE U. S.—This property continues development by driving the main tunnel. From the winze, ore is constantly being taken out, and the ore body holds its own.

THE BRUSH HEAP.—This famous producer continues to open out new ore bodies. It is reported

that it now has a larger and richer body of ore in sight than ever.

THE GYPSY.—This mine continues to produce steadily. An upraise is now being made on the ore body, and a winze is also being sunk, which is showing ore in fair quantities. It is reported that by the first of the next month, several prominent mines will resume active operations.

HILLSBORO DISTRICT.—Morris Lundy and Thomas Long, owners of the Helen mine, began work on this property last Tuesday.

BONANZA.—The Pioneer mill is running day and night upon ore from the Bonanza mine. This week they will finish up a 400-ton run, and then stop to clean up. The mine is in splendid condition, and the stopes full of ore.

EL ORO.—This property is being worked steadily under the management of Mr. Richard Troeger. The new main working shaft is now down 100 feet, and is thoroughly timbered. Ore-houses, boarding-houses, bunk-houses and a fine shaft-house, are now partially completed, over 50,000 feet of lumber being used in their construction. It is the intention of the company to sink this shaft 500 feet before stopping.

THE MAMIE RICHMOND.—This mine is working regularly under the lease system, as well as by the company, and the present workings are all in ore. The first of the week, a carload was shipped to Denver, from which the returns have been received, which ran \$157 per ton, gold and silver.

CALEDONIA AND HIBERNIA.—These properties lie northeast of Warm Springs, and are showing up very well. The former shows a paystreak of six inches of gold ore. Mr. John Donahoe recently purchased a one-third interest in the Caledonia and a one-fourth interest in the Hibernia. W. S. Hopewell also purchased an equal interest in each of these mines, John Ryan retaining the remainder of the interests. They recently made a test mill-run of five tons of ore, which gave a return of \$65.50 per ton in gold, which was highly satisfactory to the owners.

THE GOLDEN ERA.—The main shaft on this mine is down 100 feet, and levels run at 50 feet, which show from three to four feet of ore similar in character to the ores of the Mamie Richmond mine, assaying well in gold and silver.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Jan. 23, 1890.

The almost impassable condition of interior roads, together with snow blockades on two leading railroads, and several feeders, has interrupted general trade to such an extent as to make our principal business streets wear more a holiday appearance than at any time this year. Although few, if any, merchants enjoy enough business to cover current expenses, yet each and all are very hopeful of the future and look forward to a more prosperous year than enjoyed for a decade. Remittances are still slow, but money does not appear to be close except in exceptional instances. The banks appear to be well supplied with funds and doubtless meet all legitimate requirements of regular customers.

The steamer City of Peking, hence January 22d for China, etc., carried the following shipments of treasure:

TO HONO KONO.

Chinese, Mexican dollars.....	\$24,082 00
Chinese, gold coin.....	1,075 00
Anglo-California Bank, Mexican dollars.....	230,000 00
Hong Kong and Shanghai Bank, Mexican dollars.....	181,000 00
Total.....	\$437,057 00

MEXICAN DOLLARS.—The market has ruled quiet throughout the week, with toward the close quite a shading in prices, being quoted yesterday at 75½¢ @ 76 cents, and to take at the same range.

SILVER.—The principal buyer has been the United States Mint. The price paid was advanced, in sympathy with higher prices at the East and abroad, to 97½ cents, but on Monday lower prices were paid, and again on Tuesday, with a still further decline on Wednesday, the price being yesterday (Wednesday) 96½ cents. The available supply is still light, due largely to snow blockades. The recent advance abroad was owing to free purchases by India and not to the Bank of England. The latter institution, it is stated by those in position to know, has not bought silver bullion, but the English Government did, which was, at the time, noted and commented on by this paper; but the Government has not bought any bullion within the past five or six weeks. The proposition to allow the bank to carry one-third of its reserve in silver has always been allowable, made so by an Act of Parliament years ago, but has not been taken advantage of. The issuing of £1 notes against silver is a good proposition and will undoubtedly be done. In both Ireland and Scotland £1 notes are in general use and found to meet with favor. The Chancellor of Exchequer is at work on some kind of general plan to give relief to the English money market by still further introduction of silver coin.

In the local market export buyers are not, to any great extent, in the market, which gives color to a report that grain bills meet all or about all the demand for exchange purposes. After next month wheat shipments will be slower, and therefore fewer grain bills will be offering.

This (Thursday) morning there is no telegraphic communication, owing to the lines being down, so that no silver quotations, at this writing, are obtainable. Exporters are bidding below New York prices. This, they say, is due to no China business. When the Chinese business toward the close of spring sets in, then prices will be apt to again rule above New York. The last purchase report by the Mint in this city was at 97½¢ on last Tuesday. In the absence of telegrams, the Mint was not bidding this morning, or at least they so state.

Since putting the above in type, Eastern telegraphic communication is resumed, giving silver quotations in London at 44s 9-16d, and New York at 97 cents.

QUICKSILVER.—Receipts the past week aggregate 528 flasks. The home demand is quiet, owing to impassable roads in principal mining districts.

TIN.—Imports the past week aggregate 1345 ingots from Australia. Both pig and plate on spot continue to favor buyers, but owing to high prices

abroad no business can be executed. Canniers here appear to be well supplied for immediate wants. Some have started up for salmon packing.

BORAX.—Receipts the past week aggregate 264 cts. The market continues steady at firm prices.

LIME.—Receipts the past week aggregate 2184 bbls and the exports 350 bbls to the Hawaiian Islands. The demand continues slow, owing to bad weather.

CHROME ORE.—There was shipped the past week 115,780 lbs. to New York. Quotations remain unchanged.

COPPER.—There was exported the past week 20,100 lbs. copper cement to New York. In refined copper there is nothing new to report, owing to continued bad and impassable roads having cut off, temporarily, all reliable sources of information.

COAL.—Imports the past week were as follows: Newcastle, N. S. W., 6614 tons; Baltimore (Cumberland), 5917; Nanaimo, 152; Departure Bay, 800; Tacoma, 2000. Total, 18,483 tons. Greta and Cumberland are lower for spot, but for shipment they are firm. It now looks as if there will be a scarcity of Australian after the next 60 days. The tonnage on the way from Australian ports and on berth to load is smaller than for years. The worst of it is that new business cannot be executed except at higher prices. Coast colliery coal is without any special features of interest to note. With lessened Australian there will be more demand for coast coals.

San Francisco Metal Market.

WHOLESALE.

THURSDAY, January 23, 1890.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Jan. 23, 1890.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	97½	\$14 45	\$3 87½	\$20 45	
Friday.....	97½	14 45	3 85	20 50	
Saturday.....	97½	14 45	3 85	20 50	
Monday.....	97½	14 40	3 85	20 55	
Tuesday.....	96½	14 40	3 85	20 55	
Wednesday.....	96½	14 40	3 85	20 50	

NEW YORK, Jan. 22.—Borax is quiet but very firm at unchanged prices. Tin plate is offish, as is pig. Lead has a steadier tone, owing to lessened offerings. Quicksilver is fairly steady. Copper continues strong, with a fairly active consumptive demand reported. European advances still favor the selling interest.

List of U.S. Patents for Pacific Coast Inventors.

The following brief list by telegraph, for Jan. 21, will appear more complete on receipt of mail addresses:

California—Henry Anderson, assignor to R. J. Davis, S. F., pile-covering; Alonzo F. Brown, S. F., stationary spittoon; Wilfred L. Brown, S. F., machine for cleaning fiber; Amasa J. Dewing, S. F., piano stool frame-board; Jas. G. Divall, Oakland, Calif., trancols Frank, Orass Valley, combined saw, pulow and life-preserver; George Grisel, Golden Gate, assignor of two-thirds to F. S. Everlo and J. Case, S. F., machine for wrapping block matches; Lionel Heynemann, S. F., cable-street railway; Henry P. Kelley, S. F., 6th wharf; James Kelley, assignor of half to E. Dougherty, S. F., two patents for transom-litter; Darwin O. Livermore, Los Gatos, sash-fastener; John Parkin, assignor of half to R. P. Frear, S. F., valve gear for fluid rams and pistons; Adolph Sommer, Berkeley, neutralizing sulpho-chlorinated organic compounds.

"NOTICES OF RECENT PATENTS"—The patents which should have arrived from Washington this week are on the delayed mails which are clocked up in the Sierras, so we are unable to publish our usual "Notices of Recent Patents."

Mining Share Market.

La grippe, close money market with the general public, bad roads, snow blockades and other evil (from a stock point of view) influences have made a dull mining share market. If the few chippers went into the market to turn an honest penny by "cinching" the insiders or any other persons, they found it uphill work, for they sold short anyway freely the market was advanced to make them fill, and if they bought heavily, long prices were sent down to make them disgorge. Outsiders now pin their faith to the coming of Col. Mackay, for points are out that there will be nothing much until after he gets here, but how long it will be before he deigns to visit this coast remains to be seen. It now looks as if it will be all of a month, if not longer, owing to snows, etc. It is generally claimed that before the Colonel arrives in this city prices will be lower than at any time this (1890) year. In the outside stocks the Quijotas were lifeless, the Tuscaroras were hanging pending two or more assessments, and lower prices looked for; while the Bodies showed little more activity. Many well-informed on the Bodie stocks have no faith in them until after an assessment is levied on Bodie, which report gives at 50 cents a share.

Snow blockades have cut off all mail communication from the mines, except the Quijotas, whose stocks are listed on the two exchanges in this city. Telegraphic communication, which is at all times unsatisfactory, is still more so now. All ore-extracting in the Comstocks is reported to be suspended owing to heavy deposit of snow. The work now going on in the mines is of a prospecting character. Mining men here are watching with great interest the work going on running from the Ward shaft. If apparently authentic reports can be depended upon, they have made connection from the Ward shaft with about the 800-foot level in Potosi, and now they are pushing the west drift on the 1800-foot Ward shaft to intersect the ore found before they were flooded out on the 2400-foot level. This body of ore is said to be of a very important character, and if found as rich in the 1800-foot west drift as expected, it ought to make quite a stir in the group of mines in the immediate vicinity. Whether the correct information will be given out remains to be seen, for the drift running west has ever since Nov. 2, 1889, been called the east drift, although when started, Pendergast, the superintendent, stated in his official letter that the drift was started west. The prospecting work going on in the other mines is being closely watched. From the Quijota mines nothing new comes to hand. Advances from the Tuscaroras stated that it will take all of two weeks yet before certain important work can be done. From the Bodie no news is obtainable—telegraphic lines down and railroads blocked by snow. From President Ives of the Bodie and Mono mines we learn that it was the intention to have more prospecting work done in Bodie and Mono, that is, follow up by drifts or otherwise every seam of ore which gave promise of running into a body of ore. He says that it was the merest accident (a cave in the mine) that they found the rich pocket of ore from which Bodie paid its last dividends. Whether the company will be as fortunate again remains to be seen, at any rate, it looks as if work will be continued in the mines as long as the public pay assessments, provided no paying quantity of ore is run into.

Bullion Shipments.

Owing to the prevailing snow blockades on the railroad lines, no bullion shipments have been received here for the past week. Wells, Fargo & Co. have refused for several days to receive any more bullion for shipment from the mines in the snow-bound districts. Already various shipments, aggregating \$100,000, lie tied up along the routes in the mountains.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MECHANICAL PROGRESS.

American Iron for England.

It may be regarded as a matter of no little moment that a cargo of American pig iron has recently been shipped to England. "It is remarkable," says *London Iron*, "at a time when the home demand for pig iron has attained such magnitude, and when a further impetus is expected in certain quarters by orders from America, to find evidence of an opposite tendency from the latter country. One of the most curious developments of the present active position of the iron trade is that a shipment of metal has already been made from the United States to this country, and more is likely to follow. The Thomas Iron Company has sold 1000 tons of No. 1x foundry pig for delivery in Liverpool. The transaction, it is stated, was a perfectly regular one in the ordinary course of business at the ruling American prices. It is believed in Pittsburgh that more iron will go if prices warrant the shipment. From this position, it is evident that, if the price of pig iron gets much higher, we may expect American competition—quite a new feature in the home iron trade. It would also appear probable on these premises that a check against any further marked advance in the value of pig iron will be found in American competition."

The recent advance in prices will, no doubt, have a tendency to retard to some extent the shipment of iron abroad, and especially to England. Should the present speculative upward tendency die out, the indications are that one might look to an early-growing market in this direction for our surplus product. The United States is now the largest producer of iron of any country in the world, and there is every reason to believe in a continued rapid increase of that product. New discoveries of valuable iron ores and increased outputs are constantly being announced, while in nearly every other country we hear of iron mines giving out, or of their inability to meet the growing demands for their yield. In many localities the yield of our iron mines is limited only by the means for its transportation, but these facilities are rapidly being improved.

Prices of tools, machinery, barbed wire, telegraph and other wires and many other minor articles made of iron, are gradually improving, not only in this country, but throughout the world as well. If under the existing order of things we can make it pay to export the raw material, why should not our abundant and priceless resources of iron be converted into machinery and other articles of necessity by our own mechanics for export, instead of sending abroad the unmanufactured material? More and more are our enormous resources of the baser metals becoming known and appreciated abroad. The United States now stands at the head of the world in the production of both the precious and the baser metals.

CAR-WHEELS OF ROLLED STEEL.—One of the most difficult things in railway maintenance is to secure safe and reliable car-wheels. Various kinds of material and various modes of construction have been tried; but thus far nothing has fully realized what would be considered a wheel which could be accepted as any very near approach to finality in perfection. The latest and perhaps most promising device in this direction is a rolled-steel wheel which has been experimented upon with so good a degree of success, that, according to a Philadelphia exchange, it is thought the new industry which may grow out of it may mark an important development in the manufacture of steel products, and may revolutionize railroad car-wheel construction in this country. The Continental Car-Wheel Co. has procured ground for its buildings in Philadelphia, and will begin the manufacture of rolled street-car wheels. At the present time the car-wheels used for railroad rolling-stock in this country are made either of chilled iron or of softer substances, such as papier mache with a steel tire. There were 600,000 tons of charcoal iron manufactured in the United States last year, and of this amount fully one-half went into chilled iron car-wheels. For some time past, however, the increasing weight of passenger, not especially freight loads which the wheels have to bear up, has convinced manufacturers that solid steel would have to be used as material. The establishment which is to be set up at Norristown is somewhat experimental, but if rolled-steel car-wheels shall prove valuable in service, the industry is capable of indefinite expansion, owing to the immense demand for railroad cars all through the country.

NEW MACHINE FOR THE RECOVERY OF METALS. A new machine for the abstraction and recovery of valuable metals from earth, sand, clay, slag, the sweepings of jewellers' shops, and other refuse, has been perfected by Mr. T. Bodworth Sharp of Muntz's Metal Works, Birmingham, England. The machine, which is called "The Hydraulic Separator," consists of a tube with two chambers. Into the upper chamber the refuse is introduced while water is slowly rising in the lower tube at a regulated speed, and while the metals sink into a receptacle, the earthy particles are carried over the top of the tube into the refuse tank. The principle on which this invention is based is that, assuming certain metal particles sink in still water at the rate of 30 feet per minute, whereas earth sinks at the rate of 20 feet, it

follows that if the water is caused to rise in the tube at the rate of 25 feet per minute, the metal will sink to the bottom at the rate of five feet per minute, while the particles of lighter specific gravity are washed away. The apparatus has undergone various tests with complete success. One test was the placing of a quantity of small shot in two barrowfuls of refuse, with the result that the whole of the shot was recovered, while the refuse was carried away. The machine is exceedingly simple of construction, requiring no skilled labor, and the economy is such that at one of the leading works in the Midlands metal of the value of several thousand pounds is annually recovered. The invention is not only valuable to copper-smiths, brassfounders, tin-plate manufacturers and jewelers, but is claimed to be most effective for gold-mining purposes, and several of these hydraulic separators are now being sent to the South African gold-fields.—*Iron and Coal Trades Review, London.*

A PERFECT TIN-CAN MAKER.—The Philadelphia *Ledger* describes a new machine for the manufacture of tin cans as follows: The machine is about 50 feet long. The flat tin of a proper size for a can is placed on an endless chain at one end. It then passes into a machine, where the tin is rolled into the shape of a can and the edges fastened. A series of gas jets next heat the partly made can, and a pot of solder distributes its metal along the edge. The can then passes by a sharp turn to a traveler, where fingers grasp it and hold it in position as the top and bottom of the can drop through a slot into position. Another series of gas jets and solder further on fix one end, and then, by an ingenious movement of the traveler, the other end is presented to still another series of gas jets and solder, and the can is ready for use. It was just 45 seconds from the time the flat sheet of tin was placed in the machine until it passed out, 50 feet away, a finished can.

IRON AND STEEL.—While the population of the United States during the past ten years has averaged about four per cent of the estimated population of the globe, the consumption of iron and steel in this country has averaged 30 per cent of the world's consumption and now exceeds 40 per cent. The consumption of iron steadily increases, notwithstanding the recent enormous reduction in its use for railway purposes. Both iron and steel are being used more and more widely every day in buildings, bridges and other structural work; and while the American product for 1889 will exceed that of Great Britain, it is not large enough to supply the home demand. One cause of the extraordinary growth of the iron and steel industries is the cheap conversion of iron into Bessemer steel and the ready adaptation of steel to structural shapes for ships, bridges and buildings into nails, wire, axles, springs, tools, shafting, etc.

PRICE OF STEEL.—Steel is now from 30 to 40 per cent dearer than it was in 1887. This, says *London Invention* of Nov. 30th, will sensibly affect the naval defense scheme, and will cause the cost of the building of ironclads to be £30,000 per ship more than was calculated. There is also a proportionate increase in work, so that much delay will be incurred in obtaining the delivery of plates and angle bars. This will likewise add from three to four months in the construction of a cruiser. With America, according to Mr. Carnegie, making steel rails as cheaply as England, and according to Col. Shook, making iron at \$2 a ton less than it can be made for in England, it looks as if protection is anything but a failure.

THE IDEA OF THE RAILWAY THREE CENTURIES OLD.—Hitherto it has been supposed that English miners in the middle of the 18th century first utilized parallel rails, like the modern railway tracks, in the transportation of burdens. In a "Description of the World," by Sebastian Munster, 1541, a woodcut has been found containing a representation of a little four-wheeled car loaded with ore, and with a man behind shoving it along parallel rails. The scene of the woodcut is in an Alsatian mine of the first part of the 16th century. Munster calls the car in question instrumentum tractorum, and mentions that its four wheels were of iron.

Bronze for Axle-Boxes.—With the large high-speed locomotives that do so much work on the New York Central, there has been more or less trouble with the cast-iron axle-boxes breaking, and Mr. Buchanan has been trying bronze with decided success. There is now a likelihood of this material being adopted as the standard for all passenger locomotives, and its use may be extended to all classes of engines.

ANNEALING STEEL.—A good method of annealing steel is to let it "soak" in the fire until red hot, as it heats more evenly; then take it from the fire and carry it to some dark place, let it cool in the air until you lose sight of the dull red in the dark, and then cool it off in hot water. This method is called the "water anneal."

WIRE NAILS.—In 1886 the production of wire nails was about 600,000 kegs, made by 27 wire-nail works; in 1887 the production was estimated to have been 1,250,000 kegs, made by 47 works; and in 1888 the production is estimated to have been 1,500,000 kegs, or 150 per cent more than in 1886.

SCIENTIFIC PROGRESS.

Scientific Progress in 1889.

In Astronomy.

Considerable progress has been made during the year in photographing certain nebulae and other star clusters. Photography has also brought to light many very faint (gaseous) nebulae which the telescope fails to detect. The moon's surface has also been photographed and its minutest details brought out with a distinctness hitherto unknown.

The 1475 photographs of the transit of Venus for 1882, taken by the American astronomers at Washington and elsewhere, have been reduced, and the solar parallax resulting therefrom is 82 in. .847, which corresponds to a mean distance of the earth from the sun of 92,385,000 miles, with a probable error of only 125,000 miles. These numbers are no doubt close approximations to the truth, but they cannot be regarded as final until all the observations made by astronomers in other countries are reduced and discussed. From the known values of precession, aberration, nutation, and all the other factors which can in any way enter into the solar parallax, Prof. Harkness of the Naval Observatory at Washington has, on theoretical grounds, deduced a parallax of 8 in. .836=0 in. .004, which gives a mean distance of 92,504,000 miles, with an exceedingly small probable error. With this value, the sun's diameter comes out 861,670 miles.

Five new asteroids have been discovered this year. They are all exceedingly small bodies for primary planets, and are situated in that immense region between Mars and Jupiter.

A very valuable discovery of great practical importance in the manufacture of astronomical telescopes has been made by two distinguished German physicists, Prof. Abbe and Dr. Schott of Jena, Germany. The great defect in all large telescopes of the refracting kind is the secondary spectrum, due to the fact that the lenses composing the object-glass do not focus all the refracted rays at the same point. By using different kinds of glass, opticians have succeeded in bringing together two widely differing rays of light, the red and the blue, but have not succeeded in bringing together all the other intermediate rays, so as to form a colorless image, owing to what is called "the irrationality of dispersion." After numerous experiments and extensive research into the chemical nature of various kinds of glass, German physicists have succeeded in practically reducing the secondary spectrum, or the color correction, to zero in the new glass they have made. It is also claimed by the discoverers that the tool for visual and for photographic purposes are identical. All the telescopes hitherto made of the new glass have proved quite satisfactory in these respects.

In Chemistry.

A new metal has been discovered in both nickel and cobalt. Gnomion is the name proposed for it. Experiments on the compressibility of oxygen, nitrogen and hydrogen gases show that under a pressure of 15,000 pounds per sq. in. the compressibility of these gases is no greater than that of liquids, and increases in proportion to the temperature. If the density of water be taken as unity, the density of oxygen under a pressure of 3000 atmospheres is 1.1054, that of air 0.8817, of nitrogen 0.8293, and of hydrogen 0.0887. These facts have an important bearing on the physical constitution of the sun, whose interior is now regarded as a vast mass of gaseous matter under enormous pressure.

In Solar Physics.

M. Jansen of Paris has made an important discovery in solar physics. By spectroscopic observations made on the top of Mt. Blanc he has shown that oxygen does not exist in the sun. His observations show that the hand and lines of oxygen previously identified by him and others in the solar spectrum are due entirely to the earth's atmosphere. These systems of lines in the red, yellow and blue portions of the spectrum, which are known to vary with the square of the density of the absorbing oxygen, were altogether wanting, and the groups of dark lines in other parts of the spectrum, which vary simply as the density of the absorbing medium, were so faint as to leave no doubt of their total disappearance, provided we could entirely eliminate the effects of the earth's atmosphere. He has also repeated his observations on the top of the Eiffel Tower, and confirms his former results. Further researches in this direction are required to settle the matter definitely.

Explorations.

During a cruise of deep-sea soundings on a line extending from New Zealand to the Tonga or Friendly Islands, undertaken by Her Majesty's ship *Egeria*, an extraordinary depression of five miles and 168 feet was found in latitude 24° 37' min. south, and longitude 135° 8' min. west. Several other depressions were found near the same locality, varying from 3,006 to 43,000 fathoms, all of which appear to be crater-like depressions in a tolerably shallow sea.—*Baltimore Sun.*

WHILE THE LAWS OF GRAVITY are, no doubt, sufficient to explain the movements of the celestial bodies with respect to each other, there are some obscure movements which have long been investigated without any very satisfactory results; but the electro-dynamic theory is one which has often been suggested to

account for them. This theory is indeed gaining ground for more than one reason. In the light of recent experiments, and in connection with the material properties of the electric current as now generally understood, it would seem that the "ether" is not to be considered, as heretofore, the medium through which the force binding the celestial bodies to one another acts, but that it is the actual hindling element itself, fulfilling all the properties of an incompressible, highly elastic fluid. So substantially says the *Electrical World*.

TAKING AIM IN SHOOTING.—Shooting, says *Forest and Stream*, is very much like driving a nail. Does a carpenter ever take aim with his hammer, or a spikeman on a railroad with his long, swinging stroke at arm's length watch his maul as it goes around over his head to see if it is coming down in the right place? If he did, would he be apt to hit the spike? When I commenced trap-shooting I thought it was necessary to lay my cheek down on the gun stock and screw around until I got my eye and the sight in a line with a glass ball. That was before the day of clay pigeons and blue rooks. Consequently I was more often at the foot of the class than at the head. One time, after so many misses that I became ashamed of myself, I got reckless and didn't care whether I scored or not. I called "pull," drew up my gun, watched the ball fired, and was as much surprised as were my companions to see the ball go to pieces. It took me some time to get the idea, but I finally got it, and thereafter I seldom saw the sight or even the gun when I pulled the trigger, and my success was surprising. I applied the same rule to field shooting, and, without boasting, my hunting companions sometimes tell me to my face that I can shoot. Of course allowance must be made for birds crossing, rising or falling, but that is intuitive and seldom thought of by our most successful shots. Indeed, thinking has little to do with it. If it had, one's bird would be out of range before he could collect his thoughts.

COUNTERFEITING RENDERED IMPOSSIBLE.—The *Paper Trade Journal* says: The large and continually increasing demand for paper, which cannot be duplicated by unauthorized parties, for use in printing certificates of stock, bonds, drafts, notes, commercial paper, etc., has led to the production of a paper of peculiar designs. A lately patented process for making paper of this description consists in applying ink to a lithographic plate of stone or other material, placing another plate, which may also be a lithographic plate, face to face with the first-named plate, rubbing the faces of the two plates together for a time and then taking them apart. The ink will be so distributed by the rubbing action that a variegated design will be produced upon the plate. If this design is not pleasing, the plates are again placed together and the rubbing continued until a satisfactory design is produced. The ink is then allowed to dry and the lithographic plate is subjected to the usual treatment for lithographic purposes, and the design is transferred to the paper in the usual manner of printing from lithographic plates. This process is said to produce designs of such infinite variety of configuration and shade that reproduction, except from the original plate, is practically impossible. The impression may be made in any desired color.

ZERCON.—WHAT IS IT?—Zercon is a metal not found pure. In fact, no use for the pure metal has ever been found, therefore it has not been reduced. An oxide of this metal, called zerconia, is the most infusible of all the known oxides. The oxide is reduced to a fine powder. A common cotton wick is thoroughly filled with the powdered oxide, then the cotton is burned out. The wick is all consumed excepting a thin, delicate, snow-white column of the zerconia, which is left exactly the shape of the wick. As the burning gas impinges upon this column of oxide, the latter becomes heated white hot and glows with a soft incandescence, second only to the electric light. A mechanic may not know the name of this burner from the above description, but it is named the welshack and by that name will be readily recognized.—*N. W. Mechanic.*

ARTIFICIAL PROPAGATION OF THE SPONGE.—A new industry in artificially cultivated sponge is in process of creation. M. Oscar Schmidt, professor at the University of Graz, in Styria, has invented a method by which pieces of living sponge are broken off and planted in a favorable spot. From very small outtings of this kind Prof. Schmidt has obtained large sponges in the course of three years at a very small expense. One of his experiments gave the result that the cultivation of 4000 sponges had not cost more than 225 francs, including the interest for three years on the capital expended. The Austro-Hungarian Government has been so much struck with the importance of these experiments that it has officially authorized the protection of this new industry on the coast of Dalmatia.

A NEW CALCULATING MACHINE has just been invented in France, and obtained a gold medal at the exhibition. The inventor is M. Bollee of La Mans, a clever machinist, already very favorably known by other useful inventions. The machine does addition, multiplication and division with astonishing rapidity, and all by a turn of the wheel.

GOOD HEALTH.

Health of the State.

No Serious Epidemics Reported.

The secretary of the State Board of Health has issued his report for the month of December. The figures given show a pleasing state of things regarding the health of the State. Reports received from localities representing a population of 781,000 give the number of deaths at 963, a percentage of 1.23 in the 1000, or an annual mortality of 14.76, which is a little higher than the previous month's rate. This is considered a very favorable report when compared with the general average of mortality throughout the country.

Reports received from 100 localities indicate an absence of serious epidemic disease within the State. The extreme moisture and cold which prevailed during the month increased in a marked manner the frequency of all affections of the respiratory organs, with a corresponding fatality from consumption, pneumonia and bronchitis.

Typhoid fever is quite prevalent throughout the State, and influenza is also reported quite prevalent, although not having as yet attained the severity which characterizes the disease as reported from Europe and the Eastern States. It is undoubtedly the same disease, and will become epidemic, although the type may be milder. No deaths from it have yet been reported, but many of our correspondents agree upon the fact that the disease is characterized by that extreme debility which is likely to prove fatal to the debilitated, or those suffering from previous sickness, or in the very aged.

The month has been marked by an unusual number of storms upon the Pacific Coast. Rain fell in Oregon and Washington on 19 days, in Southern California on 18 days, and in Northern California on 24 days.

The mean temperature of the month was slightly above the normal temperature for December in Southern California, and slightly below the normal in other Pacific Coast districts.

In Western Washington and Northwestern Oregon the rainfall for the month was less than the average December rainfall. In all other districts the precipitation was greater than the normal amount, particularly in California, where no station reported less than twice the usual amount. At several California stations more than five times the normal rainfall was reported.

LONG LIVED PEOPLE.—The Norwegians are said to be the longest-lived people in the world. Official statistics show that the average duration of life in Norway is 48.33 for the men, 51.30 for the women, and 49.77 for both sexes. The duration of life has increased in late years. The director of the Statistical Bureau of Norway, who is authority for the above, says: "If the mortality in Norway is 17 per cent more favorable than in Central and Western Europe, it is greatly due to the comparatively slight mortality among our youngest children." To what particular cause this comparatively slight mortality among children is due we are not told, but probably anxious parents in warmer climates may take a hint from it and make inquiries.

THE INFLUENCE OF OLIVE OIL ON BILIARY SECRETION.—A late number of the *Medical News* says that the usefulness of olive oil in biliary colic seems to be substantiated by the recent experiments of Rosenberg, who, in dogs with permanent biliary fistula, finds that large doses of olive oil greatly increase the flow of bile and decrease the specific gravity. If future experiments prove the accuracy of the statements that olive oil assists the passage of calculi, not, as maintained by the supporters of the treatment, as a lubricant, but by increasing the secretion of bile and washing out the gallstones, it will probably be widely adopted if the patients do not object to the dose.

PALPITATION OF THE HEART.—A French physician announces that distressing or excessive palpitation of the heart can always be arrested by bending double, the head down and the hands hanging, so as to produce a temporary congestion of the upper portion of the body. In nearly every instance of nervous palpitation the heart immediately resumes its natural function. If the movements of respiration are arrested during this action, the effect is still more rapid.

A NEW SUBSTITUTE FOR TOBACCO is being introduced. It is a mixture of British herbs—the particular plants are kept secret—and smokers who have tried the compound declare it to be deliciously fragrant, slightly exhilarating, and withal soothing to the nerves. Combined with ordinary tobacco it is said to make a blend as satisfactory as that of chicory or coffee. At present it is prepared in Scotland, under the name of "herb tobacco," and it has rapidly grown in favor with all classes in the north.

WHITE OR BLACK.—Experiments at Leipzig, Germany, show that skin grafted from a white to a colored person becomes gradually black, and the black skin grafted upon a white person in time becomes white.

PATENT-MEDICINE CENTER.—St. Louis is now the great distributing center of the country for patent medicines. Its dealers in such goods reach more than 4,000,000 purchasers.

USEFUL INFORMATION.

Cheaper Transportation.

The American public does not appreciate or give due credit for the remarkable reductions in the charges for railroad transportation which have been made within the past few years and are still going on. The St. Louis *Republic* referring to a tariff sheet of the Chicago & Alton road dated April 20, 1863, gives the following example of rates per hundred pounds from East St. Louis to New York 27 years ago compared with those now in force:

	1863.	1890.
Cord.....	\$0 23	\$0 95
Flour, per barrel.....	50	1 90
Brick.....	20	95
Pig lead.....	20	95
Cotton.....	30	2 50
Beer.....	35	1 60
Dressed beef.....	55	2 50
Hides, dry.....	87	2 50
Hides, green.....	85	95
Flour, in bags.....	29	1 60

In what other department of industry have charges decreased from 75 to 87½ per cent in the last 27 years?

LUMINOUS PAINT.—Until recently the commercial manufacture of luminous paint has been confined to England, where a single factory turns out a small supply at a price of about \$3 a pound. This enormous cost seems to have prevented the use of the paint except as a curiosity. During the past year, however, a firm in Austria has found means to produce it and place it on the market at 50 cents a pound, or about one-sixth of the English price. Even at 50 cents a pound, a substance composed of roasted oyster shells and sulphur might be manufactured at a good profit, but at that price it is likely to come into extensive use. Wherever it can absorb light during the day it will give it forth at night, and it is said that a railway car in England, which has had its ceiling painted with it, was so brilliantly illuminated that one could see to read a newspaper in it during the darkest night, without other light. With all due allowance for the enthusiasm of early experimenters, there is no doubt that cars with ceilings so painted would be pleasant to ride in whether one could really see to read in them at night or not; and for making keyholes, stairways and sign-boards luminous, the paint would be invaluable. Its application to stairways is a particularly obvious one, and the Austrian manufacturers furnish a kind of wall paper on which the paint can be used to better advantage than on the bare plastering. The paper, which is of a leathery texture, is first treated with lime-water, and then primed with a composition furnished by the same firm. After this is dry, two thin coats of the luminous paint are applied, and the whole may then be varnished.

CARBONIZED SAWDUST FOR FILTERING.—Carbonized sawdust, saturated with certain chemical compounds, has recently been introduced into Germany as a material for filtering and at the same time discoloring liquids. Sawdust treated first with slum, and then with sodium carbonate, becomes impregnated with a precipitate of aluminum hydrate, which adheres firmly to it. After being well washed with a solution of barium chloride until no precipitate is given, the sodium sulphate simultaneously produced is entirely removed, and then prepared sawdust is ready for use. Colored liquids filtered with it have their color entirely removed by the formation of flakes with the aluminum hydrate present in the filtering material. A sawdust similarly saturated with barium chloride is used for filtering liquids, from which it is required to remove calcium sulphate, and for the removal of calcium carbonate from a solution a sawdust that has been treated with magnesium sulphate and caustic soda is employed.

TO MEND TERRA-COTTA.—Terra-cotta ware that is broken upon a slant, either outward or inward, can be mended by roughing the broken surfaces with a chisel or hammer, then placing the pieces together and pointing them with a mixture made of 20 parts clean river sand, two parts litharge and one of lime, made into a thin putty with linseed oil. If the terra-cotta is very red, the putty can be colored with Venetian red. If other colors are desired, yellow ochre or Spanish brown will give the desired shade. Two pieces of stone, brick, or similar material can be united with this cement. Sometimes it is used for covering the outside of brick buildings to make them look like stone of different kinds.

THE LATEST THING IN GLOVES.—The carrying of money in the glove is a fixed habit among the female shoppers of all large cities in this and all other civilized countries. Glove manufacturers have at last recognized the custom and made preparations to meet its requirements. The very latest "thing" in gloves is a palm pocket attachment, roomy enough for a respectable roll of bills or all the "small change" necessary for the current expenses of an afternoon among the stores. It is selling readily in Paris, and has just made a very successful entree in the American market.

ELECTRIC LIGHTING is said to be one of the hardest kinds of work for a steam engine. The continuous running and the work being thrown on and off instantaneously cause an immense strain.

ELECTRICITY.

The Materials for Electric Wires and Cables.

A discussion of electrical matters would be incomplete without reference to the important adjuncts, electric wires and cables. What belts and pulleys are to a steam system, the wires and cables are to an electric system. They are the conveyors or transmitters of the current, and through the current of the light, heat, power or sound.

The different materials from which wires might be made present an interesting property called conductivity; that is, some convey the current much more readily than others, the sizes of the conducting pieces being equal. In a water analogy, a poor conductor offering resistance to the passage of the current may be compared to a pipe with a rough and ragged interior, when the friction would materially reduce the flow. A few figures will show these differences.

Taking the conductivity of pure copper as a maximum and giving in an arbitrary value of 100, the relative conductivity of wrought iron is 16; of pure lead, 8; of mercury, 6; of silver, 100; of gold, 78; of platinum, 10.6; of aluminum, 54.2. For telegraphic practice where the current is weak, galvanized wire is almost universally used. Much the same wire is used for short-distance telephone lines, but the long distance and metallic circuit lines are now using copper wire entirely.

The high-pressure currents for lighting and power require wires and cables of the highest conductivity and carefully insulated to prevent leakage of the electrical current which not only reduces its working capacity but endangers life and property.

The need of durable and reliable insulated wires has led to the establishment and growth of an enormous industry for the manufacture of such wires and cables. The requirements to be met with are often of the most trying nature, and the problems of wire manufacturers have been difficult in the extreme. Not only must the covering exclude the air in dry weather, but must stand the storms of every season, must resist the action of gases and vapors in chemical works or in sub-surface conditions, must even allow total submersion under water for indefinite periods, besides possessing a toughness that will be proof against the rubbing or chafing of other wires and the wearing action of gravel or sand.

When it is realized that almost every accident or casualty due to electricity is either directly or indirectly traceable to defective insulation, the importance of attention to this branch of the industry is seen, and to obtain a perfectly safe insulated wire is the work of manufacturing companies that have already done so much toward improving the quality of electric wires and cables.—*Boston Advertiser.*

The Electric Telegraph Suggested 200 Years Ago.

The R. v. Canon Jackson of Leigh Delamere, Chippendale, writes as follows to the *Bath Chronicle*: "Joseph Glanvill, sometimes called 'Sadducismus Triumphans Glanvill,' rector of Bath from 1666 to 1672, was a learned writer upon abstruse and mystical subjects, but in a style of which it is not always easy to catch the meaning. In one of his treatises, called 'The Vanity of Dogmatizing,' printed in 1661, Chapter XXI, he is speaking of 'supposed impossibilities, which may not be so.' In the concluding sentence of the following passage he seems to have anticipated the electric telegraph: 'But yet to advance another instance. That men should confer at very distant removes by an extemporary intercourse is a reputed impossibility; but yet there are some hints in natural operations that give us probability that 'tis feasible, and may be compassed without unwarlike assistance from demoniacal correspondence. That a couple of needles equally touched by the same magnet, being set in two dial exactly proportioned to each other, and circumscribed by the letters of the alphabet, may effect this 'magnale' (i. e., important result), hath considerable authorities to avouch it. The manner of it is thus represented. Let the friends that would communicate take each a dial, and having appointed a time for their sympathetic conference, let one move his impregnate needle to any letter in the alphabet, and its affected fellow will precisely respect the same. So that would I know what my friend would acquaint me with, 'tis but observing the letters that are pointed at by my needle, and in their order transcribing them from their sympathized index as its motion directs; and I may be assured that my friend described the same with his; and that the words on my paper are of his inditing. Now, though there be some ill contrivance in a circumstance of this invention, in that the thus impregnate needles will not move to, but avert from, each other (as ingenious Dr. Browne hath observed), yet this cannot prejudice the main design of this way of secret conveyance; since it is but reading counter to the magnetic informer, and noting the letter which is most distant in the antecedent circle, from that which the needle turns to, and the case is not altered.' Now, though this desirable effect possibly may not yet answer the expectations of inquisitive experiment, yet 'tis no despicable item, that by some other

such way of magnetick efficiency it may hereafter with success be attempted, when magical history shall be enlarged by riper inspections; and 'tis not unlikely but that present discoveries might be improved to the performance."

ACCIDENTS FROM ELECTRICAL WIRES.—That Boston should have been seriously scorched on Thanksgiving Day by the mad energy of crossed electrical wires, says an exchange, argues nothing against the use of the electric fluid as an illuminator or mechanical motor. It simply indicates the imperfection which attends the introduction of all dangerous systems into social life, but which the age of improvement will in time render innocuous, as their nature becomes better understood. Lives have been sacrificed and property burned, and there will be more of these disasters until the time arrives when proper safeguards, born of these rude experiences, will be adopted and life and property will be no longer jeopardized. The first Atlantic voyage of Columbus was a hazardous and fearful adventure; a voyage to Europe is now a safe and pleasant pastime. "Time conquers all things" in more senses than one.

VAST ELECTRIC MOTIVE-POWER FOR PORTLAND.—A committee has been appointed in Portland, Me., to consider the subject of developing the industries of that city by obtaining electric-power from the Presumpscot river. It is said that a syndicate with a capital of \$300,000 has been formed, and that they now own the vast water-power on the Presumpscot, above the point where the large dam of S. D. Warren & Co. has been put in. It is claimed that when it is properly developed a manufacturing power equal to the combined power at Saco, Biddeford, Auburn, Lewiston and Lowell will be obtained, and that with that power at the command of the citizens of Portland, this may be made a great manufacturing city. The Warren "plant" will be in addition to this new scheme and the combined power might be almost beyond calculation.

ELECTRICITY IN MINING.—The Nevada mill at Virginia City, of 60 stamps, is now run by electricity. The plant is one of the largest in the world, and transmits on copper wires. The power is generated in the dynamo chamber, which is located on the Suto tunnel level of the Chollar incline, 1630 feet below the surface, and transmitted to the motor-room located on the surface, a total distance of 2300 feet. The dynamos are operated by Pelton wheels driven by a volume of 187 inches of water flowing down the shaft through ten-inch iron pipes. Sixty-three and one-third per cent of the power generated is landed in the surface motors. The plant has been in constant operation for three months under the supervision of Horace S. Conner, the electrician for the Brush Company.

A NEW CELL.—Report says that Mr. Edison has perfected a new cell for telegraphic use which possesses some remarkable points in its favor. A cylinder of zinc, and inside this a thick stick of caustic soda in water, constitutes the cell. It is claimed to have an internal resistance of only 0.025 ohm., and permits a discharge of 15 amperes, with an inappreciable loss by local action; an E. M. F. of about one volt., and to be free from polarization, and never needs cleaning. These are very wide claims, and if they are substantiated in practice the cell will have an extensive field of usefulness.

THE PAPER-MILLS of the L. L. Brown Co., Adams, Mass., will be run by electricity in a short time. They are now investigating a scheme for applying electricity in driving the machinery. A mile above Adams there is a 30-foot fall in the river, and the company proposes to put up an electrical plant to be run by the water-power thus obtained, the electricity being carried by wires to the mill. The engine now used is of 200-horse power, and if sufficient water-power can be obtained to run a dynamo strong enough to drive the machinery, the project will be carried through.

ELECTRICAL TOOTH EXTRACTOR.—An electrical instrument has been invented which is designed to remove the pain incidental to the extraction of teeth. It consists of adjustable, pivotally connected prongs carrying buttons and connected with an electrical battery, the buttons being placed on the face over the nerves leading from the teeth to the brain, and a circuit established the moment the tooth-extracting instrument touches the tooth to be removed.

TELEPHONES.—The action of France with regard to telephones appears to be contagious, and it is now announced by an Italian contemporary that the Italian Government intends to monopolize the telephone system in that country. Our own Postmaster-General also has designs on the telephone companies as soon as the patents of the National Telephone Company run out.

ELECTRICITY IN SOUTH AMERICA.—Quite a number of Boston firms are shipping large consignments of electrical goods to South American countries, and from what they state it seems evident that matters are in a fair way for the opening up of a great market in South America for United States electrical goods.

ELECTRICAL ENGINEERING.—The polytechnic institute at Worcester, Mass., has introduced a new course of electrical engineering leading to the degree of bachelor of science.

Passing Events.

The stormy weather still continues and the railroad lines in the Sierras and Siskiyou are blocked with snow. Hundreds of men and all the plows are at work, with but little success, however, as the snow drifts into the cuts as fast as it is removed.

No bullion was received from the mines this week, as the express companies have refused to receive any in the snow-blockaded districts.

Mining matters are pretty much at a standstill in this State and in Nevada, owing to the storm. On the Comstock no ore shipments can be made, and in this State many mills have been compelled to stop owing to the freezing of water supply. Hundreds of miners are temporarily out of work.

Unprecedented snow and rainfalls have been experienced in all directions. All the mountain towns are covered with deep snow. In some places on the railroads it is from 25 to 40 feet deep. Travel has been obstructed and business demoralized. We have had no letters or papers from north or east for a week past.

JUDGE LORENZO SAWYER, who decided the famous debris case, may resign shortly from the federal bench and retire on his pension.

The Latest Silver Bill.

On last Monday two important silver bills were introduced into the House of Representatives. One was drafted by Secretary Windom, and the other by Colonel Kirby, the veteran financial editor of the New York *Journal of Commerce*. Secretary Windom's bill is in the same line as suggested in his annual report to Congress, which was published at the time in the MINING AND SCIENTIFIC PRESS. He neither adds to nor makes any changes, and therefore it is objectionable alike to the silver and gold men. The more his bill is studied the more convinced must even the most obtuse be that there is not only "a negro behind the fence," but if enacted into a law as introduced, the result will be to make silver more of a commercial commodity than it is now. There can be no doubt but the bill will meet with strong opposition and he relegated to a back seat. If absolute free coinage cannot be secured, then Colonel Kirby's bill commends itself in more ways than one as a compromise measure; not the least of which is the placing of silver on the same footing with gold by making provision for free coinage on and after January 1, 1892. The text of the bill as telegraphed is as follows:

SECTION 1. From and after the 1st day of January, 1892, any owner of gold or silver bullion may deposit the same at any mint in the United States, to be formed into coin or bars, for his benefit, in the manner now prescribed by law for gold bullion.

SEC. 2. After the 1st day of January, 1892, the owner of any gold or silver bullion, or of any gold or silver coins of the United States, may deposit the same at the Treasury, or any sub-treasury of the United States, in even multiples of one dollar, and shall receive for the same legal tender notes of such denominations authorized by law as he may demand.

SEC. 3. After the 1st day of January, 1892, legal tender notes of the United States shall be substituted, as soon as possible, for all gold and silver certificates outstanding, and all gold and silver certificates paid into the Treasury of the United States after the 1st day of January, 1892, shall be canceled and destroyed, and legal tender notes of like denominations shall be issued in lieu thereof.

SEC. 4. The Secretary of the Treasury is hereby directed to purchase for coinage each month the maximum amount of silver bullion authorized to be purchased by the existing law from the date of the passage of this Act to December 31, 1891.

SEC. 5. After the 1st day of January, 1892, no gold or silver bullion shall be purchased for or on account of the Treasury of the United States, except so much as may be necessary to carry out the provisions of the Act to provide for the redemption of specie payment, as provided January 14, 1875, and as amended by this Act; provided that any bonds issued for the purchase of gold or silver bullion shall bear interest at not less than 2 per cent per annum, and shall be payable, principal and interest, in gold or silver coin, or bullion, or legal tender notes, at the option of the holder, and shall not be sold for less than par in gold or silver coin of the United States, or the equivalent thereof in bullion, and shall be payable at the option of the United States after ninety days' notice, to be given by the Secretary of the Treasury.

SEC. 6. After the 1st day of January, 1892, all legal tender notes of the United States shall be redeemed in gold or silver coin or bullion at the option of the holder, and when redeemed may be released from time to time as public interest may require, and shall be received in payment of duties on imports.

The above ought to go still further and make the legal tender quality of silver coin up to \$100. Experienced financiers say that no reasonable excuse can be given against increasing its legal tender quality, and if done, silver will take care of itself. The bill ought to go still further in another direction, and make the United States the sole issuer of paper currency, and in pursuance of this policy force the retirement of national bank notes. Cleveland's administration broke up that monster of corruption, the "Navy Ring," and if Harrison's administration breaks up the National Bank ring, it will deserve equal commendation.

"Dope" for Snow-Shovels.

As a goodly number of the people of California, Nevada, Idaho, Montana and Utah are about these times engaged in shoveling snow, any hint to help them in their work ought to be acceptable. It is very generally known that snow is apt to stick to the shovels and clog them up, so they have to be scraped frequently; but it may not be generally known that there is a way to avoid this and make the work easier. Up around Truckee and that vicinity, where they know something about snow-shov-

eling, a "dope," something like that used on California snowshoes, is applied on the shovels. The snowshoe dope, which keeps the shoes free from snow, is ordinarily made of beeswax, resin and tallow. By mixing these ingredients together, though with more resin and less tallow than for snowshoes, a compound is made which, applied on the shovels, keeps them from clogging with snow. The dope is about the consistency of shoemakers' wax, and is applied by rubbing in little dabs and then spreading it evenly by rubbing until a coating is evenly put on, not too thick, and a polished surface is thus obtained, from which the snow readily slides off.

The shovel should be slightly heated and the dope applied to the blade and up the handle for about a foot. This makes a smooth glazed surface which will last from a day to a week, according to the character of the snow and the amount the shovel is used. Paraffine is better than tallow for this dope, but not so easily obtained. Any one who has ever used a snow-shovel covered in this way will decline an undoped one for the future, as the work is rendered so much easier.

The Storm.

We have had no such continued stormy weather in the State since the memorable winters of 1853-4 and 1861-2, until this year, but in some respects the winter is worse than any that has preceded it since Americans occupied California. The snowfall in the mountains is heavier than ever before known, and rain on the coast has been wonderful in quantity. In San Francisco up to Wednesday the total rainfall has been 30.24 inches, the heaviest, with one exception, since 1849. The exception was in the season of 1861-62, at the time of the great Sacramento floods, when the rainfall for January alone was 24 inches. South of us, at Felton, in the Santa Cruz mountains, they have had 65 inches, and at Boulder creek, seven miles from Felton, they have had over 81 inches this season.

But it is on the mountains where most of the trouble is being experienced. The trains are blocked in the Siskiyou and in the Sierras, and have been for a week, notwithstanding the snow-plows and armies of men that have been working to open the roads and release the trains. We have had no mails from the East or North for a week, and at this writing (Thursday) the railroad officials cannot tell when the blockade will be raised.

In many of the mountain towns of California and Nevada, owing to the blocking of railroads and impassability of other roads, provisions are scarce and high. In some places they are taking provisions in on pack-trains or snow-shoes. At Grass Valley the mines, all but the Omaha, have been closed since Saturday evening, 11th inst., causing a loss to miners alone of from \$1500 to \$2000 a day, to say nothing of the loss to the mining companies. The same state of affairs exists in most other mining districts. Ore shipments have been stopped and hands temporarily laid off. There have been no bullion shipments received for a week past, and Wells, Fargo & Co.'s express are refusing to receive any for the present, as they cannot transport it.

A number of quartz-mills and hoisting works have been crushed by the snow. The hoisting works and buildings of the Brunswick and Pennsylvania mines, Grass Valley, the Orleans mill, the buildings at the Gold Hill mill, the concentrating-room of the Laramie mill, the old Crosby smelting works and Fortuna hoisting works, are among those damaged.

Mining work has practically stopped in most of the camps in this State and Nevada. In fact out-door work of all kinds, except snow-shoveling, is at a standstill. Here in San Francisco and other coast cities there is more or less distress among the laboring population, numbers of whom have been unable to do any out-door work for a month or more past. Building operations have ceased, and no street work can be carried on. The mercantile community are doing little or nothing in business, as no goods can be shipped. All these things have brought about a stringency in money matters, a result due directly to the long-continued and exceptionally stormy weather.

ALBERT E. TYRUS, a well-known mining man, died at Oakland on Sunday.

Mine Superintendent's Reports.

Judge Shafter this week sustained the demurrer in the case of Theodore Fox against H. M. Levy and other directors of the Savage Mining Co. Mr. Fox sought to recover \$12,000 penalties alleged to have been incurred by the officers of the Savage Company on account of failure on their part to post up in their office certain information concerning the superintendent's report required to be published in that way. The decision virtually says the Act of the Legislature may be ignored and that the reports need not be posted.

By Act of April 23, 1880, it is provided that in case of the failure of the directors to have the reports and accounts current made and posted, they shall be liable to a penalty of \$1000, with costs of suit, to be recovered by any complaining stockholders.

This action was brought for the purpose of enforcing this penalty against the directors for the failure to post the superintendent's report, such failure having occurred for three successive months, as specified in the complaint.

The judge in his decision says: The question is, Were the directors obliged to publish the superintendent's report under the provisions of the statute? It seems to me that there are many reasons why the report of a superintendent should not be carried bodily into a balance-sheet or an itemized account of the directors and be posted. In the first place, it is impossible, not being within the power of the directors. While the corporation must be organized and doing business, having its principal office in this city, the mine may be in Mexico, in Nevada or in Colorado. The superintendent must, of necessity, be resident at the time. His duties are to be performed there. He is required to render his report to the directors on the very day that they are called upon to publish their itemized account. It will be seen at a glance that such an act on the part of the directors is impossible.

The subject-matter of the superintendent's report could not possibly be included in any such itemized statement or balance-sheet as mentioned in the first section of the Act. The provisions commanding the superintendent to make a weekly statement regarding the number of men employed and the rate of wages paid them would be unnecessarily carried into this account, as it would furnish no facts from which could certainly be ascertained the actual disbursement for labor. Nor can the superintendent be able by any possibility on the first Monday of the month to give a complete report, under oath, of the work done in the mine, the amount of ore extracted, what part of the mine taken from, what disposition has been made of the ore, what its assay value is, nor as regards the amount of bullion received or the manner of its final disposition. Nor could large quantities of ore which had been mined, and which remained piled in the mine or on the dump, be ascertained so that the superintendent could make a statement under oath regarding such amounts of ore, or of the value thereof. Nor could the discoveries of ores and minerals, and how the location of those ores were ascertained, nor the assay value thereof, be ascertained. Certainly the directors could not be held to make a statement under oath of the particular existence of these facts, having no personal knowledge thereof.

The final paragraph in the section seems to dispose of all the superintendent's report upon these very topics. It is provided there that all his accounts, reports and correspondence shall be kept in some conspicuous place in the office of said company and he open to the inspection of all the stockholders. In short, that the terms "posted" and "kept in some conspicuous place" have separate and distinct meanings, and that these several reports and accounts cannot be held to be included within that section providing for a penalty.

ASTRONOMICAL SOCIETY.—A meeting of the Astronomical Society of the Pacific will be held on Saturday evening. The following papers are announced: "The Lunar Rills Arledaens and Hyginus," by E. S. Holden, "Physical Observations of Jupiter in 1889, with Drawings," by James E. Keeler, "The Orbit of the Binary Star, Mn Heronias," by A. O. Lenschner, "A New and Simple Form of Electric Control for Equatorial Driving Clocks," by Jas. E. Kesler.

The Structure of Clay Slate Rocks.

Stratification or Bedding, Joints and Cleavage.

The term "Clay Slate" is now generally restricted to the sedimentary argillaceous rocks having a cleavage, and which can be split into thin plates like roofing slate.

The following analysis of ordinary Welsh roofing slate (blue) given by Professor Hull will be sufficient to show that the bulk of a slate deposit is made up chiefly of silica and alumina, and was therefore at one time ordinary clay:

Silica	60.50
Alumina	19.70
Iron (protoxide)	7.80
Lime	1.12
Magnesia	2.20
Potash	3.18
Soda	2.20
Water	3.30
Total	100.00

The color of the deposit at any given place depends upon the quantity and nature of the mineral matter which we see in smaller quantities is mixed up with it.

In examining some of the slate material under the microscope, the late Mr. David Forbes found a small quantity of greenish mineral, probably chlorate.

The ordinary color of slates is blue, of different shades. This color is derived from the presence of protoxide of iron. The red and purple varieties take their color, like the marls of the Permian strata, from iron in the form of peroxide; two parts of iron combined with three of oxygen. Into slate of a green color, which is the least common variety, iron less largely enters, and in a combination with magnesia gives them the greenish hue. In soft black slates there is a good deal of carbonaceous matter and sulphide of iron in a decomposed state finely disseminated throughout the mass.

The study of the Californian slate rocks is of the greatest importance to those engaged in gold mining; by some geologists they have been called aniferous slates.

Stratification, or as it is commonly called, bedding, is a term employed by geologists to denote a parallel structure in rocks, caused by the successive subaqueous deposition of layers more or less thick of mineral matter, previously held in solution or suspension in water, the arrangement being in layers or strata more or less horizontal and parallel to each other.

Although the planes of stratification in the slate rocks are usually spoken of as parallel, this is not strictly true; however, regarded on a large scale, stratification possesses all the general features of parallelism. In some of the older slates it is often a matter of considerable

difficulty to determine correctly the lines of original sedimentary deposition. In all slate rocks, no matter of what geological age, there will be observed numerous lines of fracture cutting through the slate rocks at angles differing more or less from the planes of bedding. These joints owe their origin to purely mechanical agency, as in the case of those accompanying the dislocation, elevation or depression of the land, by which a portion of the planes of bedding are fractured and displaced, termed by miners "a throw."

Referring the direction of joints in stratified rocks to lines of upheaval, Professor Sedgwick calls those which run parallel to the strike "strike joints," those parallel to the dip "dip joints," and all others he calls "diagonal joints."

Cleavage is that peculiar structure in slate rocks which renders them capable of being split indefinitely into thin plates, or lamina, and this in a direction independent of their bedding or stratification. These lines of

DIAGRAM OF SLATE-BED.

netic currents, so that we may readily conclude that the total result was facilitated by previous long-continued action of chemical and magnetic forces.

The accompanying sketch shows the three structures—bb the planes of bedding, jj the joints, and cc the cleavage.

Those Californian slate rocks met with in connection with what is called the "mother lode" and at different points where they are being quarried for roofing slates, slabs, etc., are by analysis about the same as the best north of Wales slates, containing the proportion of silica which seems necessary for the perfection of cleavage and toughness. Roofing-slate rocks are not confined to one geological period, though in Great Britain they only occur in the older formations, the Devonian, Silurian and Cambrian. Great mistakes have been made by some would-be colliers, who have taken the shale-beds (having a laminated structure) like those met with in carboniferous rocks and

reproduced in this country. I certainly know of no single work from which as good an idea of the recent triumphs of celestial photography is obtainable."

LOWER CALIFORNIA SILVER.—H. J. Patterson, an old prospector, has returned from San Felipe bay, 125 miles south of Yuma, on the Gulf of California. He brings silver ore from an 18 inch vein, which is found to be rich. He and two others lived 13 days on oysters after the supplies gave out, and while waiting for a schooner ordered to come from Guaymas, Patterson walked 124 miles to Alamo, killing quails and jackrabbits for food, and sent back supplies.

SAYS the *Lompoc Record*: There are now at work in the beach mines five companies, all doing well. There is nothing fabulous in these mines, but it is demonstrated that it pays to work them. With each recurring tide the mines are surcharged with gold, so that prac-

The Silk Industry in California.

Since the work of the State Board of Silk Culture has lapsed temporarily at least by failing to receive funds from the State, it is gratifying to note that experimental work has proceeded with the small appropriation of money by the U. S. Government under the painstaking and economical administration of the Ladies Silk Culture Society of California. There has been issued recently an interesting report in pamphlet form of the transactions of this organization for the fiscal year ending June 30, 1889. It comprises the report of the President, Mr. W. B. Ewer, the secretary, Mrs. L. E. Pratt, the Experimental Committee of which Mr. J. J. Rivers is chairman, and appended thereto is the financial statement as approved by R. J. Tramball and Edward Bosqui, Auditing Committee. A copy of this report, which can be had by application at this office, should be secured by every one in any way interested in this industry.

The report by President Ewer shows that the 15-acre Silk Experiment Station is progressing as well as the limited means at hand improvement will admit. The mulberry plantations are growing well and will soon supply an abundance of foliage of good varieties, which is, of course, at the basis of all feeding trials. It is to be hoped that by the time this requisite is arrived at the funds may be available for equipping the station buildings and other needed improvements. The president's report also alludes fittingly to the field for silk-culture and the various aspects of the industry as affecting the prosperity of the people. Silk-culture is advocated as a cottage or family industry and not as a corporate or capitalist undertaking. Filatures may be profitably conducted by capitalists, but the cocoons will be produced by family labor in the modest homes of the country. That is the way it is done in Europe and seems the most feasible and practical basis for its extension in this country.

The report shows that the Ladies' Silk Society did a very timely and important work in purchasing cocoons last summer when the State Board was obliged to suspend its operations. The financial report shows that there were purchased up to June 29th cocoons from between 30 and 40 producers, mostly ladies, resident in different parts of the State.

Mr. Rivers, as chairman of the Experiment Committee, makes an interesting report concerning a part of the work at the Piedmont Station, relating especially to the feeding of worms, the production of eggs, the killing of the obrysalis, etc.

It will be gratifying to the friends of silk-culture to know that the work has been continued so intelligently in this State in spite of the many obstacles which have been encountered.

Reverberatory Furnace.

The accompanying cut shows a half-plan of a reverberatory furnace such as is used for ores. These furnaces are used for roasting ores in chlorination works, and are preferred by many to the different forms of mechanical furnaces where no hand-stirring is required. The reverberatory is very effective in its operation.

THE STATE UNIVERSITY.—The titles of the instructors, which were changed when the faculty was classified on "a commercial basis," have been restored, so that there are now more "professors" than there were a month ago. Among others, there is now a professor of mining and a professor of mineralogy and geology.

SECRETARY NOBLE has decided that a married woman can make timber-land entries or purchase such lands in the States of California, Oregon, Nevada and Washington, provided that it is conclusively shown that the entry is made for her own use and benefit, and not for the benefit of herself and husband jointly.

THE winter in the East has been so mild that the Pennsylvania collieries are shutting down and discharging their miners. Over one-third of the collieries have already shut down. These employ about 3000 men. The officials say that of 20,000 coal cars in service, 11,000, all loaded, are now lying along the road.

DURING 1889 the immigration into British Columbia, by the Canadian Pacific system, was 500 less than the number that departed.

HALF-PLAN OF REVERBERATING FURNACE FOR ORES.

sometimes forming the roofs of some of the seams of lignite for slate rocks.

The time is coming when the great value of our Californian slates for roofing, and also the manufacture of slabs into various architectural and domestic uses, will be better understood and will no doubt supersede the wooden and metal fittings now in use.

The slabs made into troughs, cisterns, and for sanitary purposes from their cleanliness, ought to supersede all other materials.

In 1880 the profit derived from the whole production of slates of North Wales, G. B., was taken as a million sterling. In this country the production yearly of roofing slate is valued at about \$2,000,000.

WILFRED T. NEWBERRY, of Placerville, and connected with mining affairs in this State, died of alcoholism at the Baldwin hotel this week.

THE average wealth of each man, woman and child of Colusa county is \$1500.

tically the mines are inexhaustible. For months the same ground has been mined over, week after week.

NEW LITHOGRAPH VIEW OF GRASS VALLEY.—We have received from Mr. H. S. Spaulding of the Grass Valley *Tidings*, a large and beautifully executed lithographic view of Grass Valley, Nevada county. The work appears to be a full and faithful representation of the town as it is at the present time. The streets, churches, and many of the principal dwellings, are distinctly shown in a bird's-eye view. All old residents of that beautiful mountain town should secure a copy. The map will be sent by mail, in a substantial paper cylinder, for 50 cents for one copy, or three copies for \$1. Address the *Tidings*, Grass Valley, Cal.

THE Tomstone Prospector says the mines must be pumped out and work started with outside capital or the whole country will go to the dogs.

PARKE & LACY COMPANY

— IMPORTERS AND MANUFACTURERS OF —

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,

FURNACES, HOISTING WORKS, PUMP-
ING MACHINERY, ETC., ETC., of any DE-
SIRE CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL

The Patentes and Manufacturers
 cordially invite miners to critically
 examine and pass judgment upon
 this improved system of milling
 and amalgamating ores in the fol-
 lowing particulars:

1. The cost is less than one-half of
 stamps of same capacity.
2. The freight to mine is less than
 one-half of stamps.
3. The cost of erecting is less than
 one-fourth of stamps.
4. The power to drive it is less than
 one-half of stamps.
5. The wear is less than one-quar-
 ter of stamps.
6. There is no wear except on
 shoes and dies.
7. In point of amalgamation it is
 superior to any other machine
 in use.
8. In its simplicity of construction,
 We challenge competition with
 Stamps, Ball Pulverizers or and
 other ore crushing machines now
 before the public.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Sole Manufacturers,

327 First Street, San Francisco, Cal.

"WITTER'S SPRINGS." 16 miles from Lakeport, 20 miles east of Ukiah. Comfortable Hotel. Quiet Cabins. Lovely Scenery. Low Charges. Its waters are a sure cure for Dropsy, Scrofulous and Skin Diseases; Rheumatism, etc. Address H. L. DENIO, Upper Lake.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15. No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly,
THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.
ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vann or concentrating devices.
(Signed) DAVID MCKAY, JR.,
Supt North Star and Original Empire Mining Co

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Centrifugal Roller Quartz Mill. 213 FIRST STREET, SAN FRANCISCO, CAL

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

A Modern Gold-Mill.

A cut on this page shows a modern 40-stamp gold-mill run by steam-power, such as are used all over California. The mill is usually built in such a situation that the ore can be delivered by car or wagon at the upper part where it is dumped against an inclined "grizzly," and the finer ore passing through the interstices of the grizzly, falls directly into the main ore-bin. The coarser ore (too large to pass through the grizzly) is screened off by gravity into the coarse ore-bin, from which it is drawn by gravity directly into the rock-breakers, or it falls upon a floor in front of the rock-breakers. By these it is crushed, and falls into the main ore-bins. From the main ore-bins the ore passes through gates into the "self-feeders," which supply it automatically to the batteries. Quicksilver is fed at intervals to the mortars of the battery, and coming in contact with the native or "free" gold of the finely crushed ore ("pulp"), forms with it an amalgam. This amalgam is caught partly by the copper plates in the battery, and partly upon the amalgamated or silver-plated copper plates, after it has issued through the screens of the mortars. The amalgam is "cleaned up" periodically and retorted. Retorting consists in the sublimation of the quicksilver, the vapors of which are condensed in water and the quicksilver collected. The residual gold is in a porous state. It is melted with fluxes in crucibles and cast in ingots. The mill shown in the engraving is from a design of the Union Iron Works in this city.

The pulp from which the free gold has been extracted by amalgamation passes over concentrators of various mechanical devices. These concentrators effect a separation of the auriferous sulphurets from the worthless gangue. In California the concentrated sulphurets are treated by the chlorination process. In some

METHOD OF QUARRYING OUT LARGE BLOCKS OF SANDSTONE.

other sections of the country the sulphurets are sold to smelting works. The gold ores of California carry on an average two per cent of sulphurets. The concentrated sulphurets assay on an average from \$60 to \$90 per ton in gold, with from a trace to several dollars in silver. The custom chlorination works of California charge \$20 per ton for the treatment of sulphurets, and return 90 per cent of the assay

value. Under conditions ordinarily favorable, a plant treating 6 to 9 tons per 24 hours can reduce the sulphurets at a cost of \$3 to \$10 per ton, extracting 90 to 94 per cent of the assay value of the gold.

Sandstone.

Around the Bay of San Francisco there occur sandstones of a considerable variety of colors

which are beginning to come into use to some extent. The prevailing colors here are brownish and gray. On Angel Island there occurs a fine sandstone of a greenish-gray color, which was used in the Bank of California building; and others of a lighter shade are found in various parts of Alameda county. A few miles south of San Jose there are also inexhaustible supplies of light-gray and buff stone, but which are worked only in a small way. Near Cordelia, Solano county, there occurs a dark-gray, volcanic tufa that can perhaps be utilized for rough construction.

A very valuable handbook, by Geo. P. Merrill, curator of the Department of Geology at the Smithsonian Institute, has just been issued, being a description of the collection of building and ornamental stones in the U. S. National Museum. The book is not a dry catalogue, but is well written and interesting, giving as it does so much information concerning all sorts of building-stones.

Among other things is a description of the sandstone quarries at Portland, Conn., a cut of which is shown on this page. The stone is of medium fineness of texture, of a uniform reddish-brown color, and lies in nearly horizontal beds varying from a few inches to 20 feet in thickness. Natural blocks 100 by 50 by 20 feet occur, and hence blocks of any desired size can be obtained. The blocks are roughly trimmed down with picks at the quarry, and shipped thus to New York and other large cities to be worked up as occasion demands. Scarcely any of the material is dressed at the quarries. The stone has been used in all our leading cities, particularly in New York, and has even been shipped to San Francisco via Cape Horn.

A CALIFORNIA 40-STAMP GOLD-MILL WITH CONCENTRATORS.

Locked Up.

Gold in Nevada County's Gravel Channels.

It is only a mere matter of time, says the Nevada Transcript, when the National Government will wake up to the exigencies of the case and turn its attention to unlocking again the golden treasure-house of the gravel channels, which are known to contain to-day more gold than has ever yet been taken out of them—large as that sum has been. In order that the public may form some idea of the value of the gold known to exist in only one of the gravel channels in the county of Nevada, one need but look into the testimony taken in the Woodruff case from unimpeachable witnesses, backed up by facts such as could not be controverted, as to the yield of the one main channel which occupies the ridge between the Middle and South Yuba rivers. It has been from four to six millions of dollars in gold per mile.

There can be no doubt that the amount of gold remaining in the unworked ground of the North Bloomfield Gravel Mining Co. is at least \$10,000,000, perhaps more. Its deep tunnel, constructed at a cost of three-fourths of a million dollars, controls enough more ground along this channel, belonging to other parties, to turn out at least \$8,000,000 more. And it owns other ground which is partially opened which certainly contains \$4,000,000 more.

The Milton Mining and Water Co. owns of unworked ground on this channel enough to turn out at least \$10,000,000 more, besides claims (that can be worked through its tunnels) not belonging to it, in which there is at least \$10,000,000 more.

The Eureka Lake Co. owns of this channel enough to turn out at least \$20,000,000 more, thus making in the property owned and controlled by these three companies, not less than \$60,000,000 in gold. If to the property of these three companies he added the remainder of this known channel on the ridge, it will carry the total value of gold, in some 18 or 20 miles of this channel alone, up to nearly or quite \$100,000,000.

This value, as was stated in the evidence referred to by one of the witnesses thoroughly familiar with the subject, and indorsed by others, "is known not as a matter of conjecture but as a matter of certainty." All have a vague idea that the yield from the quartz mines has been in the past very large. But where \$1 has come from quartz mines, five or more have come from gravel. In fact the ariferous gravel channels, so-called, are the great storehouse of the gold deposits of the world.

This one hundred millions of treasure is now locked up by injunction, and while its extraction would keep thousands of workmen busy at large wages, and the product would stimulate all industries in our State, the country must sit down by its treasure-box, fold its arms and do nothing, because a few hundred acres of land in the great valley of the Sacramento is temporarily injured, and our wise judges say that none of our engineers are able to cope with so simple a problem as the construction of a dam to impound the dirt or debris which may come from mining out this gold, although there are engineers who have not hesitated to grapple with the problem of building an earth dam 170 feet in height, to impound water for the Spring Valley Water Works of San Francisco; to dam at Folsom a stream that during the winter months becomes a raging torrent; and in New York in connection with the Croton Water Works, to build a dam of stone 250 feet high.

This vast treasury has, in the past, been attacked by the three corporations named at a cost, for tunnels, water reservoirs and canals, of not less than \$6,000,000. But under the decrees of the courts, which have judicially determined that no dam can be built which will impound dirt and stones, these vast mines are idle, and the works connected with them fast going to decay. This is the case in one section of the State, covering some 20 miles only in length of this golden channel. If to it is added the hundreds of miles of similar deposits in other parts of the State, it is certainly within bounds to say that because a few acres of land in the Sacramento valley, of the value of about \$1,500,000, are temporarily injured by the past mining operations of nearly forty years, these hundreds of millions of dollars in gold which are known to be within these channels must remain locked up.

The result of the sage conclusion of these wise judges is that the slime of litigation and stupidity is gradually destroying and covering up all the extraordinary structures, built by the miners at enormous cost, requiring years in their construction, so deep that unless some relief can be had by legislation, they will soon be so buried and destroyed that they will never again be utilized, and the gold contained in these vast treasuries will remain there for all time.

The vast water reservoirs with the thousands of miles of deep tunnels will never again be reconstructed, if now allowed to fall into disuse and decay; and the gold will remain locked up where it is until wise counsels prevail.

THE CANAS MINING CONCESSION.—Mr. Fernando Beteta de la Pena returned Wednesday from a trip occupying 23 days to the Coconino country, 60 miles east by north of Alamo, where the mining territory recently conceded by the Government to Eugenio I. Canas is

located. Mr. Beteta has a hand on the property. He made a thorough examination of the territory embraced in the concession and found it to be very valuable both in placers and ledges, and is confident that it will prove to be a grand property. There is an abundance of water for all ordinary purposes, but not enough to carry on mining operations on a large scale, and Mr. Beteta will proceed to dig wells in the most favorable locations. He states that excellent water can be procured at from five to 20 feet below the surface and in large quantities. He also states that his company will probably begin active work on the property within 60 days.—Lower Californian.

Valuable Deposits.

Glass Sand, Coal and Porcelain Clay at Lincoln.

A. H. Gates, who lives near Lincoln, furnishes the Auburn Herald with the following particulars relative to the glass industry soon to be developed at that place. The tract in which the deposits named are found was recently sold by the Buckeye Mill Company of Marysville:

"Borings have been made this fall under his directions, on the property where the old coal mine is situated, for sand suitable for manufacturing glass. The anticipations of the projectors have more than been realized, as sand of the purest quality has been found in large quantities and at various places. This sand, it has been found, is in one distinct layer, and occupies one entire 40-acre tract. It lies at a depth of from 13 to 18 feet below the surface, and is from three to six feet in thickness. It is 95 per cent silica and is as clear, as Mr. Gates expresses, as the water of a mountain spring. The projectors have calculated that there is sand enough in this one layer to run a factory 100 years with an output of 20 tons of glass per day. Below this sand deposit is one of coal, which is from 8 to 10 feet in thickness. A pound of this coal has been found under a rigid test to yield four cubic feet of gas. The coal will be used to run the engine and the gas to melt the sand. Between the sand and the coal is a deposit of fine porcelain clay, which in some portions is three feet thick. The clay is of various shades of color, being pink in some places and dark gray in others. When burned it becomes pure white. Before this report reaches the readers of the Herald a company will have been formed with a capital of \$500,000. A factory will be erected on the land, and operations will begin at an early day. This means employment for a large number of hands, and will add greatly to the prosperity of Lincoln. The company intends to manufacture plate-glass exclusively, and will have a good thing though they charge the cost of transportation and the rate of duty only."

A GOLD MEDAL.—James D. Schuyler received notice yesterday morning that a gold medal had been awarded him, but his numerous friends were not engaged in congratulating him during the day. In fact, they did not know anything about it, for the modesty of the member of the Board of Public Works kept him from informing his friends of the distinction which had been conferred upon him. A Union reporter, however, unearthed the facts, and found that Mr. Schuyler, who is a member of the American Society of Civil Engineers, has been awarded what is known as the Normal Gold Medal, it being the first prize for a paper read by Mr. Schuyler before the annual convention of the society October 17, 1888. The paper, which has been published in pamphlet form and illustrated, is entitled "The Construction of the Sweetwater Dam." The last meeting of the society, at which the above-mentioned medal was awarded to Mr. Schuyler, has just been held in New Haven, Conn.—San Diego Union.

HONDURAS MINES.—The Honduras Gold Placer Mining Company has executed a lease of their five-mile concession on the Guayape river to the Honduras Gold Company. The agreement dates from October 1st last. By this arrangement it is stated that the same amount of gold will be taken out of the one claim that would have been taken out of two separate claims, thus effecting the saving of the cost of turning the additional claim, and also avoiding any trouble that might have arisen from the labor question, tailings, backwater, or other points of difference that sometimes arise between rival companies. The Honduras Gold Placer Mining Company will receive one-half of the net profits of the Honduras Gold Company, besides acquiring a half-interest in the extra 2000 varas that have been turned over to that company, and their directors have also an equal voice in the control of the finances.

STOCK EXCHANGE COMMITTEES.—The following committees have been appointed by the president of the San Francisco Stock and Exchange Board: Executive—A. W. Foster, J. H. Crocker, George I. Ives, Thomas Whetstone and George W. Cope. Finance—A. F. Coffin, C. E. Paxton and Geo. W. Kelly. Stock List—Jos. Marks, A. G. Garnett, H. H. Noble, E. P. Murphy and Werner Stauff. Commission and Rules—Coll. Deane, H. H. Shinn and E. Epstein.

1887	104,045,059	41,595,853	39.7-10
1888	114,341,502	38,004,826	33.2-10

The metals, lead, silver and gold are obtained in almost all the productive mines located in this inter-mountain region. The ores are mostly low grade, and the assimilation of the metals causes the process of smelting to be the favorite and most economical method of reduction. This fact will explain the increase in the percentage of gold and silver produced in the manufacture of base bullion. It demonstrates conclusively, that any legislation, having for its object the repeal of the present tariff on lead, or the placing of the product of lead or lead ores on the free list, must diminish its production, and decrease in the same ratio the gold and silver product of the United States. This injury to our great mining industry is augmented by the action of the Treasury Department in admitting foreign ores (notably from Mexico) free of duty under a strained and doubtful interpretation of the present laws.

Stewart's Mining Bill.

A correspondent of the Georgetown (El Dorado county) Gazette says:

We have before us a copy of what is termed Stewart's Mining Bill—"to amend Chap. Six of the U. S. Revised Statutes, relating to mineral lands and mining resources."

After an experience in various kinds and methods of mining since 1849, and the practical workings of the different laws and regulations which have from time to time been adopted, I submit the following in reference to the proposed bill:

That portion of Section 2324, R. S., to be amended so far as relates to change of time, viz.: "The year within which the annual labor or improvements required to be performed or made by this section shall commence at 12 o'clock meridian, on the 1st day of October of each year"—and further on in said section, "In case the first day of October falls on Sunday, or any holiday, the following secular day shall be construed as the first day of October within the meaning of this Act"—no doubt would prove of real benefit, and correct some of the looseness and misunderstanding of the present law.

That portion of the proposed bill making distinction between placer and lode claims—the term placer embracing surface, drift and seam diggings, lode that of quartz only; surface and drift merge into each other, seams and lode into quartz—that only \$25 worth of labor should be required to be performed on the former (placer) and \$100 worth of labor on the latter (quartz), seems hardly just, as these claims embrace the same areas, 20 acres each, and the same surroundings according to location. Either assess the required labor to be performed on each at \$25 or \$100. The amount really makes little or no difference, but should be equal. The remaining portion of the bill is only ingenious tinkering or paraphrasing of the present law. With the change above noted, the present law answers all practical purposes, and no further amendments ought to pass.

It is difficult to those who have been engaged in mining these many years to understand the necessity of putting the mining interest into strait-jackets or being corralled by bar-wire surroundings, which is not applied to other occupants of the public domain.

The wise and early course pursued by the Government in allowing the miner the free use of the mineral lands for exploration should relieve him from being considered a highway

robber, to be pursued year after year by ignorant legislators or bribed officials.

If any legislation is necessary to advance the mining industry, it is in the direction of restricting the action of railroads within railroad grants by setting up their false and fraudulent claims to lands known to be mineral, and their persistent attempt to secure the same by exhausting the energies and means of those engaged in the occupation of mining. Their influence with the local land officers seems omnipotent.

NEVADA'S SALT MOUNTAINS.—The salt mountains located on the banks of the Rio Virgin, an affluent of the Colorado river in Lincoln county, Nev., cover an area of 25 miles, extending to within seven miles of the junction of that stream with the Colorado. The salt they contain is pure and white and clearer than glass, and it is said that a piece seven or eight inches thick is sometimes clear enough to see through to read a newspaper. Over the salt is a layer of sandstone from two to eight feet thick, and when this is torn away the salt appears like a huge snowdrift. How deep it is has not yet been ascertained, but a single blast of giant powder will blow out tons of it. Under the cap-rock have been discovered charred wood and charcoal, and matting made of cedar bark, which the salt has preserved, evidently the camp of prehistoric man.

THE Elkhorn Mining Co., Jefferson county, Mont., was organized in 1883, and the dividends paid out during the last year amounted to \$180,000. The property has just been sold to the Mining and Financial Trust Syndicate (limited), London, for \$560,000. The property embraced in the inventory of purchase includes 90 acres of ground, a well-equipped mill, good machine-shop, hoist and all the supplies and stores on hand.

SILVER DISCOUNT.—The discount on silver bullion reduced the coin value of the December yield of the Hale and Norcross mine \$12,000. The discount on the yield of the Con. Cal. and Va. for that month was \$42,450. The discount on the entire December yield of the lode footed up \$102,000—more than one-sixth of the amount of the total product.

A TACOMA DISPATCH says at least ten human beings and thousands of cattle and sheep have perished in the lizards which have raged over the State of Washington since the first of the year. Reports from Colville reservation are that cattle are dying by hundreds from starvation and thirst.

Snow-Shoeing in the Sierra.

The continued stormy weather in the mountainous portions of California has brought snow-shoes into prominence, since they are now being used in so many places by men to pack in supplies where the roads are blocked. The snow-shoes used here are very different from those in use in Canada. Snow-shoes for traveling in California are from 8 to 12 feet long, $3\frac{1}{2}$ to 4 inches wide, and $1\frac{1}{4}$ inches thick in the center. They are tapered at the top from the center to one-fourth of an inch in thickness at the toes, and nearly flat. The toes are turned up like sleigh-runners. They are nearly of uniform width from end to end—a little wider, if any, on the front—and a spring is worked in so that without weights they rest on the heels and points; but when the rider stands on them the weight is somewhat evenly distributed and a concave groove is made at the bottom, beginning near the toes and running to the heels, similar to the bottom of the skates. The bottoms are highly polished and tar is turned and rubbed in until a

or no spring being required on the back part—the most essential being the front. The object of this is that in running over rough places there will be no sudden jerk, endangering the equilibrium of the rider, who often attains a speed of 60 to 80 miles an hour on these shoes. They have a tendency to "hook" when going over uneven snow, and the rider often finds that they are as uncertain as all other things are here below.

The rider stands a little back of the center, his feet being held by toe-straps of strong sole leather or india-rubber belting, fastened to either side of the shoe, and laced where they meet over the foot. The toe of the foot is put into the straps back to the ball, and in the hollow of the foot there is a small block inserted crosswise to prevent the foot slipping back; but this does not prevent the foot, when the heel is raised, from being slipped out of the straps. The bottom of the shoe resembles a skate with a groove, but instead of being convex, it is concave. This is necessary to balance the weight of the rider as equally as possible from end to end. They are constructed on the principle of skates, and to some extent the same evolutions are practicable, such as allowing the points and

temperature, up to the frozen, when a hard dope is required. The manufacturer requires considerable skill and ingenuity. A great deal depends upon the boiling of the dope; some requires but a light simmer, enough to melt the parts together, while another requires a good deal of boiling—gum, beeswax, rosin, sperm candle, and some other materials make an inferior quality of dope, only used for traveling purposes, but modern "lightning dope" is manufactured from spermaceti, Burgundy pitch, Canada pitch, balsam of fir, spruce, cedar, Venice turpentine, oil of cedar, pine, hemlock, fir, spruce and tar, glycerine, Barbary tallow, camphor, and castor oil, and many costly drugs known only to those who make it a specialty and its manufacture a secret. Oil, grease, and such material, one might naturally suppose would cause a shoe to slip easily over the snow; varnish or any other polished material is useless, nothing but the scientific preparation will do. It may seem that a "snow-shoelist," who enters the arena for a hard contested race, to meet all the changes of snow, must have a commissary and necessary varieties of dope, for it is a common saying among snow-shoers that "Dope is King."

strange gyratory motion in the air, a thing not uncommon with beginners upon these quick and uncertain carriers.

The racing track, clear of trees, shrubs and other obstructions covered with many feet of snow, the more the better, is chosen on steep side hills and is about 1000 to 2000 feet long with angle of depression of 15° to 35° being always in a direct line and as even as possible. The winning poles are set on the lower end, on comparatively even ground, in order to give the racers a chance to brake up, after passing through; which is done by dragging their poles behind the shoes and bearing heavily on them in a sitting posture.

Great steadiness is required in riding, and very perfect control over the shoes; but still with all, the best riders sometimes plow the snow and hound in the air at a fearful rate. Serious injury is seldom sustained from falling. The greatest danger lies in other riders coming in contact with one falling.

The mills of the California Hosiery Co. at Oakland have been closed down. Secretary Williams stated that the general depression of the woolen market was the principal cause of

SNOW-SHOE RACING IN THE SIERRAS.

full, mahogany-like finish is obtained, which hardens the wood, makes a smooth surface, and attracts heat when exposed to the sun—the latter being a desideratum in putting on the "dope" when traveling.

A good many years ago we had in the PRESS a description of snow-shoeing in the Sierra, written for us by C. W. Hendel, the well-known deputy mineral surveyor of Sierra and Plumas counties. With this was a sketch which we here reproduce as appropriate to the times and the season, showing a snow-shoe race in the mountains of California.

Shoes made for racing are from $10\frac{1}{2}$ to $13\frac{1}{2}$ feet in length, from $3\frac{1}{2}$ to $4\frac{1}{2}$ inches in width, wider on the front part than on the back. Where the turn commences to the heel, or back end of the shoe, there is a fluted or concave groove about $\frac{3}{8}$ of an inch deep at the heel and tapering in depth from the turn at the point. This groove is about $1\frac{1}{2}$ inches wide, narrower at back end than in front. On top of the shoes, a little back from the center, there is about 18 inches of wood left flat, and toward the front they are shaved and planed, tapering sufficiently to leave the point springy. There is considerable wood left behind from the center to the end, which makes the proper balance—little

curves to describe a circle. Of course they cannot be turned so easily or quickly as skates, but still they are easily managed by experts.

The *sine qua non* of snow-shoe racing is "dope." This is the material used to lubricate the bottom of the shoes and cause them to glide swiftly over the snow, as an axle is lubricated, to cause the wheel to revolve easily, the object being to counteract friction as near as practicable. To such a perfection has the manufacture of this article attained that friction has to a great extent been overcome.

The temperature of the snow is as variable as that of the atmosphere, and for every temperature of snow a different kind of dope is required. Every racer has at least half a dozen recipes for compounding the "dope," sometimes termed "greased lightning"—one for cold snow and one for warm (?) or damp snow, as it is called by experts, as when the snow is heated by the rays of the sun; one for dry snow and one for wet, one for hard and one for soft; one for forenoon and one for afternoon; for extreme cold or frozen snow; and for new dry snow there is still another kind required. Some go so far as to have a different kind for every hour of the day. For moist snow the dope is soft, and is made harder for increase of

The dope, in order to be good, must possess two qualities: First, it must be sticky so that it will adhere to the shoe. Second, slippery, so that it will glide over the snow. And, strange as it may seem, they have attained such a degree of perfection in making this compound that a snow-shoe prepared with it and placed by the side of one with the bottom finished with polished steel, would so far outrun it as to make it no race at all. In riding for the first time down a steep hill on shoes so prepared, the great requisite is confidence. Timidity is fatal, and for one, on starting down a hill, to be afraid of falling, will never do; he might with as much success try to stem the current of the Niagara river as to keep from falling when he thinks he may, or has not confidence in himself. In racing, it is advisable to ride very low upon the shoes, in what is called the "squatting" position, and to hold the pole in the right hand, and in going over any obstruction, occasioned at times by a tree lying across the track under the snow, or by the wind drifting and forming a depression and elevation, which will, when a snow-shoelist is going down very fast, make a considerable lift; both shoes and rider, and sometimes the shoes go on their course alone, while the rider is making a

the company's going out of business, as it was considered better to round up the affairs of the concern than to run it without prospect. The company is solvent. The entire woolen market has been at a standstill for several years, and that the directors decided not to wait until times improve.

AMERICAN COKE AND COAL IN EUROPE.—The Reading Railroad Co. is reported to be perfecting plans for exporting anthracite coal to European markets. Samples have been prepared and will be shipped to Antwerp. The high cost of this coal laid down on the continent, it is admitted, will prevent any but the wealthier classes from becoming consumers of it. The price, it is said, will range from \$8 to \$10 per ton. Similar action is reported to be contemplated by large coke operators who, it is said, anticipate developing some trade in this product with English iron manufacturers.

WHAT IS LATENT HEAT?—The following very good definition is given by a cotemporary: "Latent heat is the quantity of heat which must be communicated to a body in one state in order to convert it into another state without changing its temperature."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

[The snow blockade on the railroad lines has prevented the receipt of exchanges from Oregon, Washington, Idaho, Montana, Utah and parts of Nevada and California, so that we are again this week, as last, unable to give our usual quantity of current mining news.—EDS. PRESS.]

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Ledger*, Jan. 25: Work at the Lincoln is to take a more extensive range. Mr. Stewart, satisfied of the existence of another ledge, parallel with the one now being operated, has let a contract to sink 50 feet to test the quality of the ore, which from prospects taken from the surface will reach a paying standard. The mill has come to a temporary standstill to await more favorable weather. W. Body, an expert in the management of concentrators, has arrived from Nevada, and is engaged for a short time to overhaul the Wildman concentrators. The North Star is running along in its usual groove. They are working at the 600 level, but in all probability they will conclude to return to the 800 level again before long, as it is known by all good miners that the ore chimneys pitch south, and as they are a considerable distance south of the South Spring Hill mine, the ledge may be found at the 800 or 1000-foot level.

AMADOR.—Cor. *Ledger*, Jan. 25: The Keystone mine and mill have shut down in consequence of the large amount of water entering the mine this winter. A steam pump in the north shaft is unable to cope with it. Prospecting is still continued in the 1400-foot level. They are also short of wood, teams being unable to travel over the roads. The Gower mine has suspended operations, the supply of powder having run short, and there is no way at present of getting it from Ione. The electric lights are again lighting the South Spring Hill, adding much to the appearance of this well-regulated mill; the stamps are dropping as regularly as ever.

KEYSTONE.—Amador *Ledger*, Jan. 25: All the men employed at this mine in extracting rock were laid off on Monday morning, owing to the impracticability of keeping the mill going, and at the same time control the largely increased flow of water incident to the incessant rains. About eight men will be kept at work underground in prospecting operations.

GARDINER.—The tunnel which is being run on this property has reached a distance of over 700 feet. Seven months have elapsed since Robert Stevenson bonded the property and entered upon the work of its development. Under the energetic management of James Gleason, 1000 feet of tunnels and drifts have been run. One ledge, 10 feet wide, known as the Paugh ledge, was cut some time ago. A few days back another quartz body was tapped by breaking into the side of the tunnel, the thickness of which has not been ascertained. A sample of the rock from this ledge was shown us this week. It is different from the general character of the quartz on the mother lode, but yields a very good prospect. The tunnel is now about 100 feet from the Union ledge—its objective point. All the hands were temporarily laid off Monday, owing to the heavy snowfall. There is talk of putting up a mill on the mine the coming summer.

HARDENBURGH.—Work at the Hardenburgh mine has been suspended temporarily, owing to the impossibility of getting material for the erection of the hoisting works. The shaft has been re timbered down to a point where the timbers were found to be sound. This is all that can be done until timbers for the hoist are received. All work has been suspended at the North Gower mine until the weather becomes more favorable. The Bunker Hill keeps its 40-stamp mill working steadily, and is said to be running satisfactorily.

The Amador gold mine continues to run its tramway over the Doyle ground, notwithstanding the injunction suit which has been commenced. A large force is at work under George Durham grading for the track. Owing to the late severe storms the 10-stamp mill of the Sutter Creek mine has been shut down. On the tunnel level the water is over the track. They expect to resume milling operations in a few days.

Calaveras.

WEST POINT.—Cor. Calaveras *Chronicle*, Jan. 25: Messrs. Brown & Hurley started their 20-stamp mill last Monday morning. They have an abundance of rock on their dump and we hope to see them make a good cleanup. It is reported that Mr. Moore has found some very rich rock in the new shaft south of the Blazing Star. They are now taking out some very rich rock at the Blazing Star. Mr. Moore has a large amount of ore on the dump ready for shipment as soon as the weather and roads will permit.

COPPERPOLIS.—Cor. San Andreas *Prospector*, Jan. 25: As soon as the weather permits, an entire renovation of the Union mine office and chambers of the superintendent will be made. Several new rooms will be added and porches will be built over the front and sides. Five hundred cords of wood will be cut and stacked for the future use of the mine. The leaching process is going on and so is mining for ore. The large smelter will soon be in operation, and a large force of men will be employed.

El Dorado.

BLACK SAND.—An important discovery has recently been made in the matter of tailings, or black sand from cement gravel, now being worked by different processes of reduction. This gravel, as found in the old river channels, is too hard to be worked by ordinary sluicing and therefore, in order to obtain the gold contained in it, it must be reduced by machinery. Not long ago, Mr. Louis Landecker, principal owner of the Chili Ravine mine and mill, concluded that gold might be escaping, and to test the matter took several pounds of tailings to Mr. Montgomery, a practical assayer of this city, who obtained gold from the sample at the rate of over \$600 per ton of gravel. Not being fully satisfied, Mr. Landecker sent a sample of the same material

to Thos. Price & Son, assayers of San Francisco, whose returns showed about the same result, giving over \$600 per ton. The mill has ten stamps, and crushes about 60 tons of cement gravel per day. Mr. Landecker is now improving means by which to remedy this great loss of gold. Dr. W. W. Stone had a test made from the tailings at the Gignac mine, where a Bryan roller-mill has been running on the same kind of cement gravel that is found in the Chili Ravine mine, and obtained gold at the rate of \$250 per ton from the gravel. The tailings at the Chili Ravine mill seemed to be more than double the value of the material at the Gignac mine. Whether the difference is caused by the mills, or in the richness of the material worked, is a question; in either event the loss is more than the mining interest can bear, and it is hoped that experiments now being made may stop this enormous loss.

Nevada.

NO DAMAGE TO THE BRUNSWICK.—Grass Valley *Union*, Jan. 22: The report that some of the works of the Brunswick Mining Co. had been crushed by the snow proved to be incorrect. Only a shed was broken down, which was of small value.

ANOTHER MILL CRUSHED.—*Transcript*, Jan. 25: The Baltic Co.'s mill at the Gambrius mine on Poorman's creek, Eureka township, has been crushed flat by the snow. It has been unused for some time.

THE HYDRAULIC ITEM.—Grass Valley *Union*, Jan. 25: The Nevada *Herald* published an item a few days ago that information had been received by snow-shoe line that the large hydraulic mines in the upper portion of the county were running at full head, as the snow blockade made it impossible for the anti-slickens spies to get into the country and obtain any knowledge of the work. Everybody up this way understood that the item was but a joke, but it has been taken somewhat seriously down below and the officers of the North Bloomfield, Omega, Eureka Lake and Milton Mining Companies, at San Francisco, have felt called upon to send a letter to the press denying that there was any truth in the report. This was scarcely necessary, as it must be evident to any one who has heard of the snowstorms that have been prevailing in the mountains for several weeks that it was a physical impossibility to carry on hydraulic mining, even if there was a disposition to do so.

SOME WATER FOR THE MINES.—Grass Valley *Union*, Jan. 29: On Monday the ditch-tender reported that about 150 inches of water was coming into the large reservoir of the South Yuba Company near Banner hill, which was furnished by Little Deer creek. From this supply the Pittsburg mine expected to start its pumps yesterday, and in a few days more, when the connecting ditch is cleaned out, the North Banner mine will receive a supply from the same source. The pumps of both mines have been stopped for a week or more and the water has been rising in the lower levels. Superintendent Skewes says the North Banner can be pumped out in two weeks when they can get water-power again. There is no expectation that the main line of the South Yuba canal can be opened in less than 10 days or two weeks, with favorable weather, as there is a great depth of snow on a portion of the line, and the snow will have to be shoveled out of the canal. In the meanwhile the supply of water obtained from Little Deer creek will be of some use to the mines of the district, in aiding the pumps, and saving fuel, which is scarce and difficult to obtain. All of the mines that were compelled to use steam to keep the pumps going, have but a scant supply of wood.

Placer.

SUCCESSFUL ENGINEERING WORK.—Placer *Herald*, Jan. 22: Connection has been made between the new and the old works at the Mayflower mine, and the work proved to be a great success. The survey came out right to a dot and the water in the old works was tapped without the least trouble. The surveys have all been made by Ross E. Browne, and from the beginning have proved correct in the nicest particulars. His work included three very close calculations. First, there was the connection in the new tunnel between its mouth and its shaft; second, the tapping of the channel, and last, the connection with the old works just accomplished.

San Bernardino.

TEMESCAL TIN.—Chino *Champion*, Jan. 25: There is little if any doubt but that the famous Temescal tin mine will be practically worked soon. Mr. Robinson, a large owner in it, was recently reported on his way from England, whither he went on a cable dispatch from the intending purchaser. The English expert who examined the property for his clients made a very favorable report—more favorable than the owners of the mine expected. With pottery, rock, cement and coal at South Riverside, coal and pottery at Elsinore, and a producing tin mine between, a railroad through Temescal canyon will be a necessary and a paying property.

OIL AT PUENTE.—San Bernardino *Times-Index*, Jan. 25: There are 14 wells being worked at Puente, of an average depth of 1000 feet. They are situated high up the sides of a small canyon which winds through the bosom of the hills, and from them the oil is forced to two immense tanks at the summit of the range; from this height it is piped by force of gravity to a reservoir at a siding of the Southern Pacific Railroad seven miles distant and about a mile from Puente Station. The economic advantages which characterize the situation and control the working of the enterprise are remarkable, and they greatly enhance the value of the property. For instance, the pumps are worked by 13 steam engines, the steam for all these being supplied by two boilers—those at wells 1 and 9—the steam being piped from them to all the engines. The only fuel being required by the two furnaces is natural gas piped from the crossing of the wells, supplemented with less than a barrel of the crude oil every 24 hours. The heavy cost of wood or coal and the expense of transportation and handling that would attend their use as fuel is wholly saved.

IRON.—San Diego *Union*, Jan. 23: There is good authority for stating that the two noted iron mines in San Bernardino county, known as the Iron Chief and the Granada, have changed ownership. From the relation the purchasers bear to the great San Luis Rey water enterprise, it is presumable that the mines were bought for the purpose of manufacturing iron and steel water-pipe to be used in distributing the water of this great system. In

this view the fact is quite significant, not only as showing the far-reaching purposes of the men connected with the enterprise, but also as pointing to the development of iron mines and manufactures as an outgrowth of the water enterprise. These iron mines are about a dozen miles from the Atlantic & Pacific railroad and can be reached by a spur from that road, or, perhaps, would be in or near the line of the new road to Salt Lake. Not only the iron of Utah, but the iron from these mines also will come here if the Utah coal can be brought here to smelt and manufacture the ores.

San Diego.

VAN WERT.—Julian *Sentinel*, Jan. 24: Ferguson & Wilson are sinking a shaft on the Van Wert mine, north of town. They are down 25 feet and intend to keep going until they strike it rich. There has been a large amount of gold taken out of this mine in former days and the boys have faith that it will pan out again. We should not be surprised to have the pleasure of recording another rich strike soon.

GOLD AND COPPER.—San Diego *Sun*, Jan. 18: Some three or four months ago, Wilson Baldridge entered upon a prospecting tour of the more promising country in the vicinity of Alamo. He has recently returned to refit himself for a more protracted trip. In the course of his explorations he carefully prospected many miles of the country northwest from the present mines, and he claims to have discovered several very promising leads, which will, he thinks, prove as profitable as any yet opened in Lower California. Mr. Baldridge will endeavor to interest some moneyed men in that district, as he firmly believes it will yield as handsomely as the Alamo mines are now doing. Not only did he discover very promising gold leads, but several rich indications of copper, which, he thinks, will assay equal to any ever known in California.

Shasta.

LOWER SPRINGS.—Cor. Shasta *Democrat*, Jan. 22: The company that is operating the Gage place, on the Igo road, is managed by Mr. Beecher. He informs me that the tunnel is now in 130 feet, and he expects to strike the ledge soon. The company has a shaft down upon the ledge over 30 feet, and all in good ore. The Swasey mining property, about half a mile north of the Beecher tunnel, has been sold to a S. F. Co., and three men are now running a tunnel. Halley's find, on Salt Creek, below John Tiffin's old hydraulic mine, turned out \$500 or less. Pugh, of Salt Creek, has purchased the Kempton machinery and is placing it lower down on the creek. Randel, of Redding, has the working of ore from John Tiffin's mine. A young butcher from Shasta has found a very fine ledge of gold ore within 30 feet of the main ledge, which promises to be of considerable importance to this district. Dr. Reese of Shasta is running a deep cut for the purpose of striking the ledge 30 feet below the surface. Doc's mine is noted for producing a splendid lot of good ore.

CALUMET.—Redding *Free Press*, Jan. 25: The very day the Calumet Co. was ready to start its new mill for working by the Paul new dry process, a snowslide carried away some 75 feet of flume which conveyed water to the mill, thus cutting off their power; but this did not stop them, as they at once made connection with their steam-power and started up.

Tuolumne.

RICH.—Tuolumne *Independent*, Jan. 25: The mine of A. B. Cruickshank, at Groveland—the Mary Ellen—is developing into a very rich property. Sixty feet below the old level they have struck the rich shoot worked last year, which is proving as valuable as it was found above. Some of the rock worked before went \$60 per ton, and the present strike is as good, if not better.

CLIO.—Some work is now being done on the Clio mine, near Jacksonville. This property produced some very good rock in early days; a 4-foot vein of \$14 rock was not considered a bonanza then, but it would be now.

POCKET.—Messrs. James Stone & Pedro took out another pocket in their mine, at Brown's Flat, last week. The mine is owned by Mr. John Pedro, of Jamestown, from whom the mine is leased. We are pleased to learn of the young men's good fortune, and hope they will unearth many more. The last cleanup was over \$1500. It is said that the Gale & Wickham mine, at Tuttle town, has been steadily yielding a golden harvest. It is reported that the machinery for the Rawhide mine is about completed at the foundry in Amador county, and that active work will be commenced this spring.

DISSATISFIED.—There is a great deal of dissatisfaction among the miners at the Golden Gate mine, for being compelled to do single-band drilling.

MALTMAN'S chlorination works have started up again, and machinery for a quartz crusher in connection with the works, arrived this week.

WORK on the New Albany mine will be resumed just as soon as the weather will permit.

NEVADA.

Washoe District.

OVERMAN.—By *Telegraph*, Jan. 29: Are stripping ore on the 1200-foot level, near the Seg. Belcher.

NEW YORK CON.—Are timbering the upward continuation of the 800-foot level.

SEG. BELCHER.—Ore bunches are still showing in the 1200-foot level drift from the winze. The 1000-foot level east crosscut is in porphyry and clay.

JUSTICE.—Shipped 257 tons of ore, assays of battery pulp samples showing an average value of \$23.74 per ton.

ALTA.—The mill stamps are hung up pending repairs. We are sinking a winze below the 925-foot level to cut the downward continuation of the high-grade ore from the above level.

UTAH.—The explorations on the 600-foot level were resumed Monday. The mine has a supply of fuel on hand sufficient to keep the hoist plant in operation throughout the winter.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the third and fourth floors above the 400-foot level. On the 450-foot level we are extracting ore from the third floor. The 500-foot level east crosscut is discontinued, and a west crosscut has been started 70 feet south of No.

3 raise. The 550-foot level line, east crosscut, is advanced 9 feet in porphyry and clay, and the west crosscut is extended 6 feet in quartz, showing value.

Tuscarora District.

NEVADA QUEEN.—Superintendent's Report, Jan. 25: The north gangway from the 600-foot level of the North Belle Isle shaft has been advanced 24 feet. The rock is harder.

BELLE ISLE.—No. 2 crosscut from north gangway on the 350-foot level is extended 13 feet; the rock continues hard. The crosscut near the south line on the 250-foot level is extended 20 feet.

NAVAJO.—No. 2 crosscut from the south drift on the 250-foot level is extended 27 feet; the face is about the same as at last report. The upraise from the south drift on 150-foot level is extended 7 feet. The vein contains much low-grade ore.

NORTH COMMONWEALTH.—The north drift from No. 1 east crosscut on the first level has been advanced 14 feet, exposing fine ore; the face of the drift is all in ore. The east crosscut from the second level station has been extended 20 feet. The formation is changing, and looks like the rock near the vein.

GRAND PRIZE.—The following extensions have been made during the week: 400-foot level—The west drift from the north crosscut is extended 9 feet, and the south drift from the winze 13 feet. 500-foot level—The east drift from the north crosscut, 21 feet; west drift from the same crosscut, 27 feet. There is no change in the above-mentioned workings.

NORTH BELLE ISLE.—The north gangway on the 600-foot level is extended 24 feet. The rock is getting harder. The south drift from the station crosscut on the 300-foot level is extended 13 feet; the face is in vein formation. The south intermediate from No. 3 chute above the 300-foot level is extended 9 feet. The face shows high-grade ore of fair width.

DEL MONTE.—On the first level the drift started to open up ore in the east crosscut is in 9 feet. The ore is high grade and looks well. The joint crosscut on the second level is extended 30 feet, and is being pushed to reach the vein. The north drift on the third level is extended 5 feet, making the total 44; there is good ore the entire distance. Everything about the mine is working well.

COMMONWEALTH.—On the first level the east drift from No. 1 north drift is extended 15 feet. The west drift from the same point is extended 15 feet. No. 1 upraise is up 31 feet, No. 2, 16 feet, and No. 3, 15 feet, all three showing high-grade ore. The opening from No. 1 chute is in a distance of 23 feet and is ready for stopping. The north drift from No. 5 chute is extended 11 feet, with but little change. The stopes on the first, second and third levels are all looking well. We sent 490 tons of ore to the concentrators, the average assay being \$18.24 per ton, and the average of concentrations \$266 per ton. One day was lost on account of the storm. The mill is running well. Bullion was shipped to the value of \$14,952.70. Bullion is on hand valued at \$17,000, and will be shipped to-morrow. Everything about the mine and mill is working smoothly.

ARIZONA.

THE TOTAL WRECK.—Tucson *Citizen*, Jan. 16: The principal mines of this district are the Total Wreck mine, the Red Rock, the Justice, the Denver and the Prosperity, all of which have been producers of the paying ores. The first mine discovered in this district was the Justice mine, some time in 1876. This mine has been worked month by month by leasers, who have always derived a large profit from their leases. Next in prominence was discovered the Total Wreck mine. This mine has been a large producer of silver, yielding about \$300,000 in bullion. This mine following the vein has been worked to a depth of 650 feet. At this, the lowest depth, the ledge is over 50 feet in width but of low grade. Later, during October and November of 1889, work has been done on a hitherto undeveloped part of the mine, between the 350 foot level and 450-foot. This work has developed ores richer than any yet discovered in the mine, several carloads of which have been shipped to El Paso, Texas. All familiar with the Total Wreck mine pronounce it a valuable property and cannot understand why it is not continuously worked. There is one of the best mills in the Territory, built right at the mine, belonging to this property, two steam-hoisting works and extensive pumping machinery to supply water to mill and mine. The supply of water is inexhaustible. Every appliance for the economical working of the mine and mill is attached to this valuable property.

GOLD.—Prescott *Courier*, Jan. 21: The storm caused the Oro Bella mill to suspend action for a couple of days. It is now knocking gold out of quartz. The Ryland mill is crushing away. The Congress and Quartz mountain mills are running day and night. John McDonald recently shipped a big lot of rich silver ore through the Prescott ore works from the famous Blue Dick mine. He will follow this shipment with another shortly. The purchase of the Gray Eagle mine gives the Oro Bella Co. two very fine ledges. E. S. Junior and — Brittingham have plenty of shipping ore on their dumps in Bradshaw mountain. All our miners believe that a great mining camp will soon spring up on Hassayampa creek, near the Senator. Dave Grubb's ledges, Harlan's, Flints, Ross' and other mines. Frank Moss of the Jupiter mine, Antelope mountain, tells the Phoenix *Herald* that he panned out a nice gold nugget from surface dirt which, for an average depth of six inches all over the claim, is placer ground worth \$15,000. Mr. Palmer, ex-superintendent of the Congress mine, reported \$285,000 in sight on the claim from present development.

DIFFERENT CAMPS.—Mohave *Miner*, Jan. 25: John Barry has several men at work on the Minnesota. J. O'Brien has a big streak of galena on the Schuyllkill. Geo. Koster is getting some very fair grade copper ore from the old stopes of the Altatta. Sample and Jamison now have the Bonanza of Layne Springs, 14 inches of 450-oz. ore. Shippee and Sberick are taking out some fair grade ore from the paymaster, on a lease. Uncapher and Finegan struck it good on a new location near the foot of the Ithaca peak. Geo. Dyke and Chas. Frolich have a good streak of ore in their location just east

of the Connor. The whole face of the tunnel on the Empire is in very rich ore, showing much native and ruby silver. Rogers and Brinkley are driving the tunnel on the Ajax and are taking out some rich chloride ore. Erin Sherman has a carload of lead on the Rainbow, which he will ship as soon as the roads and trails get in traveling condition. Mackenzie's bonanza on the Cupel is getting bigger every day, and 25 men are knocking it out and bringing it to the surface at a lively rate. Hoisting works have been bought for the Oro Plata, and will be erected at once. It is reported that C. E. Sherman has leased the Duffett mine in Chloride to Denver parties, who also have a bond on the claim and will immediately begin work on it. The main shaft on the Tuckeyhoe is being sunk as rapidly as the bad weather will admit, and the ore is improving in quality as well as in quantity at each successive foot in depth. Park and Hudgens have a lease and bogged on the Sabbath Bell near Mineral Park and have several men at work sinking the shaft. They have about four inches of rich ore in the bottom. J. W. Marshall is driving the lower tunnel on the Pixley and has struck some rich rock. The Pixley is a parallel vein with the Night Hawk, and is a 12-foot vein of ore lying between a dyke of porphyry and the granite. It is reported that Geo. Bowers has bought out Mrs. Perry's interest in the Night Hawk, and he will put hoisting works on the mine and sink the shaft. Robert Meera and Jas. Cadden will start operations on the Kanawha Belle. This claim has produced and has in sight some of the richest ore ever produced in the county. Heimrod & MacDuffie have purchased a one-half interest in the Sunset mine, near Chloride, from B. McCall, and have started to sink a new shaft. They have a good streak of exceptionally rich ore to start on. C. A. Park has obtained a new lease on the Queen Bee and they will put up some kind of hoisting works and sink the shaft down 150 feet deeper before summer. The bottom of the 100-foot drift on this claim has a showing of an average of six inches of ore for 150 feet in length without a break—ore that has been working from 285 to 600 ozs. silver, and from 3/4 to 4 ozs. in gold. Scores of other claims are being worked all over the district and are producing more ore, and better ore, than ever before in the history of the county, and on the whole there never was a time since the first discovery of ore in Mohave county when there was a brighter outlook or more activity in mining affairs than at present, and every one feels sanguine that by the time summer comes there will be ten times as many men at work in the mines and ten times as much ore being produced as has ever been before.

COLORADO.

TELLURIDE.—Cor. Denver *Republican*, Jan. 25. Telluride is in a fair way to enjoy the boom which will reach us in the spring. Companies engaged in mining are making preparations to keep up with the times, and in Grey's basin a new stamp-mill will be built. Two mills in Turkey Creek basin are now ordered and will be in at an early day. Judge Cartigan, the sole owner of the Belmont mine, is thinking of putting in an electric plant and mill, and the Sheridan mine will run its full capacity of 40 stamps. The Sheridan tunnel, one of the greatest undertakings the San Juan has ever known, will be driven through a mountain a distance of about 3300 feet to connect with the shaft on the Sheridan mine, and will be finished in April if all goes well. This tunnel will tap the vein at a depth of 400 feet lower than the present workings and is expected to open up an immense body of ore. The Gold King now has a small force at work taking out ore, and as soon as water can be removed the mill will start up again, and an increased force of miners put at work. The Illum mill at Ophir will soon begin pounding away on Single Standard and El Mundo ore again. From the large amount of snow that has fallen your correspondent is warranted in saying that the placers down the Miguel river will keep pace with ore lode claims, as several of them are now in the hands of companies who can and will work them if water can be had.

NEW MEXICO.

HERMOSA.—Kingston *Shaft*, Jan. 18: The Pelican mine is showing up better than at any time for the past six months, although from 30 to 40 tons of ore have been shipped from this mine every month. Considering the high-grade character of this ore, what mine in the country is doing better? Culver and Knapp have taken a lease on the Antelope. They commenced work the first of the year. Some of the leasers on this claim are doing fairly well. Dr. North and Wm. Hall have taken a lease on the Ocean Wave, and have good ore to start on. E. F. Holmes has purchased the Wm. Dunn interest in the Argonaut mine, which was owned by Drake & Dunn. Extensive developments may be expected on this claim.

HACHITA.—*Western Liberal*, Jan. 24: John Dennison was up from Hachita yesterday and reports matters as very quiet in that camp.

THE CARLISLE CO. has enough ore mined to keep its mill running for several months, and so has discharged all of its miners but four. The company now has about 40 stamps dropping in its big mill.

FRUE VANNERS.—R. B. Potter, the superintendent of the Humboldt company at Shakespear, informs the *Liberal* that the Frue vanner recently placed in the mill has worked very successfully on Shakespear ore, saving as high as 71 per cent and regularly saving 65 per cent. The company is so well satisfied with this work that it has decided to put in several more vanners, enough to work the mill to its full capacity. The steady running of this mill will add considerably to the prosperity of the camp.

FIFTY-FOUR THOUSAND OUNCES SILVER.—*Silver City Enterprise*, Jan. 21: They say things are quiet at Lake Valley, but there is quite a hum of interest up there now, on the lease of T. B. Savage and Frank Thoman on a 50-foot square piece of ground of the Silver Mining Co. They worked this ground for six months, getting small pay most of the time, but a day or two before their time was out they came into fine ore. The general manager promptly gave them one month's extension of time, and with only two men at work on ore, they have taken out the unusual amount of 54,000 ounces of silver. Savage has in the past four years made two other strikes rivaling this one in value.

The Year's Work at the Mining Bureau.

Through delays in receiving the money appropriated for its support, there was left to this institution but a short working season the past year. Notwithstanding this hindrance, the forthcoming report of the State Mineralogist will, as we understand, reach very respectable dimensions. This report, now in the hands of the State Printer and nearly ready for binding, will contain much information of a thoroughly utilitarian kind, very little space having been given up to speculations or theories unsupported by facts. The most of this information has been embodied in a series of articles, each treating of some special subject connected with the mining interests and industries of the State.

The most important feature of the report, however, consists of the field-work performed during the year, and which has gone to the collecting of data for a complete topographical map of the State, this to serve as the basis of the projected geological map to be constructed thereon. This work, of which a good beginning has been made, will now be followed up and vigorously prosecuted the coming summer, it being the intention of Mr. Ireland to start out a corps of assistants as soon as the weather will permit, preparations preliminary to that end having already been completed. Operations will commence on the southern border of the State, whence they will be extended northward. That they will, by reason of the unusual snowfall on the Coast Range and adjacent mountains be delayed beyond the expected time, now seems probable. The topographical map, which is to comprise the results of all official surveys heretofore made in California, will, however, be completed in time to go with the next Annual Report of the State Mineralogist.

The contents of this volume have been prepared by men thoroughly qualified by education and practice to well perform the several tasks assigned them. This has insured for the papers that go to make up the body of the report, a value that would not attach to the work of the mere empiric or the tyro. Where it is sought to use this information it can, as a rule, be relied upon, nor will it ever be found grossly misleading.

We have always contended that the work of the State Mineralogist should be of a more practical kind than characterized some of the earlier reports emanating from the Bureau. To devote the whole or most of a volume to a description of a single mineral product seems hardly politic, however perfect such a description or however important such product may be. Whenever especially full and detailed information is in any particular case required, it can be obtained from other sources, generally within the easy reach of the student, and may therefore well be dispensed with in a volume designed for common use.

We have in former issues of the *PRESS* expressed the opinion that the information of which the miners, as a community, most stood in need was such as related to the best methods extant for ore extraction and reduction, including a description of the mechanisms, modes and processes employed to that end. They want to be more fully posted on the subjects of ore crushing and smelting, amalgamation, concentration, chlorination, etc. Happily the present State Mineralogist, with a just comprehension of these underlying wants, has from the first worked in the direction of supplying them as far as may be.

Looking over the several reports prepared by Mr. Ireland, we find them almost wholly given up to matters bearing on the solution of the above questions, some of the monographs published in these volumes amounting to a complete treatise on the subject considered. Take for example the paper on the building and outfitting of quartz-mills; we don't see why a tolerably good millwright might not go on, select a site, put up and equip a plant of that kind, and do the work fairly well guided by the instructions contained in that paper alone; nor could such mechanic go far wrong if, in selecting a water-wheel, he studied what is said a few pages further on concerning structures of that kind. And so of much more that requires to be learned from trustworthy sources. It can be found in this series of reports, the information so conveyed being not only author-

itative and practical, but brought down to most recent dates.

The mineral specimens sent to the Bureau have been very numerous of late, some of these coming from distant and widely separated localities. And thus the cabinet, already large, grows apace, this collection comparing favorably with others its seniors by many years. The classification and arrangement of these numerous samples is both systematic and scientific, being grouped into families, and these subdivided into species, all properly labeled and so displayed that they can be readily recognized and examined. Besides metals and minerals, many other things have been contributed to the Museum, some of these being rare and curious, a few possessed of much intrinsic value.

It is worthy of remark that this large and valuable cabinet has cost the State very little, nearly all the specimens having been collected by the State mineralogists and their assistants while in the field, or through exchanges effected with similar establishments elsewhere, not a few having been donated by the devotees of science or other patrons of the institution. The Bureau and everything connected with it is kept in admirable order, both the convenience and comfort of the attaches and visitor to the place having in all its appointments been consulted. As the Museum has undergone steady enlargement, so has the number of its visitors been constantly on the increase, many of these being residents of other States or of foreign countries. Few foreigners who come to this city fail, in fact, to pay the Bureau a visit.

The Astronomical Society.

At the meeting of the Astronomical Society of the Pacific on Saturday last, Vice-President Wm. M. Pierson occupied the chair, President Holden being snow-bound on Mt. Hamilton. The secretary announced the receipt of 75 presents and publications, among which were two large drawings of Jupiter by Prof. Keeler, made at the Lick Observatory in July, 1889. A committee to nominate directors was appointed. The chair announced the success of the Lick Observatory eclipse party sent to South America by Col. C. F. Crocker. The following new members were elected: Adolph Sutro; Mateo Clark (life); Jose A. y Bonilla, Zacatecas, Mexico; Leon K. Fuller, Brattleboro, Vt.; Fred G. Wattles, Denver, Col.; Prof. M. W. Harrington, Director Ann Arbor Observatory; Hugh Howell, Oakland; Prof. Ira Moore, State Normal School, Los Angeles; T. S. Palmer, Sup't of Agriculture, Washington; J. L. Scott, Shanghai, China; P. V. Veeder, San Mateo. The total membership is now 190.

A paper on "The Physical Appearance of Jupiter in 1889" was read by Mr. Keeler and illustrated by 24 drawings, made during the opposition of 1889, with the 36-inch equatorial at the Lick Observatory. Reference was made to the extremely satisfactory views obtained with the great telescope, and a resume given of the different kinds of astronomical work in which the instrument had proven proficient.

This paper was followed by one entitled "A New and Simple Form of Electric Control for Equatorial Driving-Clocks," also by Mr. Keeler. This ingenious contrivance is attached to the driving-clock of the great refractor of the Lick Observatory, and is giving great satisfaction.

It was announced that the directors, with the approval of Alexander Montgomery, had determined to expend \$1000 of the Alexander Montgomery fund to found a library for the society, named after the donor, and the remainder of the fund (\$1500) is to be invested, and the income only to be used in the preserving and enlarging the same.

On the Comstock there has been a total suspension of operations in leading mines with the exception of the Justice, Alabama and Occidental, on account of the impossibility of moving ore trains and the scarcity of fuel for operating the steam-hoist plants. The pay-rolls of mines for the current month will fall \$150,000 short of the usual average and the bullion yield of the Comstock will be curtailed half a million.

CAPTAIN J. M. KEELER, formerly connected with mining affairs, and who became quite prominent in Inyo county a few years since, died in San Francisco this week.

At La Porte, Plumas county, the snow lay 20 feet deep on a level.

Taxes on Real Property.

Adjustment Between Seller and Purchaser.

Though an investigation of the law at any time since the organization of this State, and certainly since its laws were codified, would have resulted in a full knowledge of this interesting problem, it is strange that its solution has been, and is now, unknown to those most interested, and until recently we have had no satisfactory settlement of the question.

In a late case of Brown vs. Yost, which came before Judge Wallace of the Superior Court of S. F. on appeal from the Justices Court, a decision was rendered Jan. 13, 1890, which is undoubtedly the true solution. Judge Wallace, in an able opinion, holds that the tax becomes a lien which attaches as of the first Monday in March of each year (Pol. Code, Sec. 3718). Further, that this lien having the force and effect of an exaction duly levied (Pol. Code, Sec. 3716) is "an incumbrance." That when a grantor makes a conveyance in which he uses the word "grant," he covenants that the property is free from incumbrances done, made, or suffered by the grantor (Civil Code, Sec. 1113). That the term "incumbrances" includes taxes, assessments and all liens on real property (Civil Code, Sec. 1114). Therefore, the grantor must make good his covenant by removing the tax lien created as of the first Monday in March. If real property is conveyed at any time after the first Monday in March by a deed using the word "grant" (which is the common form of deed), and no other words are used to restrain the Code presumption, the seller must pay the taxes for that year; and this is true even though the amount be then unknown, and the tax not yet due and cannot then be paid. If the seller do not pay the taxes, the purchaser can do so to prevent sale for delinquent taxes, and then recover from the seller in an action on his covenant.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

SAN FRANCISCO SYNOICATE AND TRUST CO., Jan. 20. Object, to manage real estate and loan and borrow money. Capital stock, \$100,000. Directors, C. E. Mayne, R. T. Pittingill, H. S. Smith, D. Z. Ashly and G. H. Perry.

SONORA M. CO., Jan. 22. Capital stock, \$50,000. Directors—J. H. Neale, E. M. Thompson, C. A. Stratton, A. F. Collins, J. J. Nachrich, A. F. Johns and Geo. A. Carter.

SARATOGA PACKING CO., Jan. 22. Object, orchard cultivation and to deal in fruits. Capital stock, \$50,000. Directors—Robert Balfour, Frank C. Beazley, Geo. W. Spencer, Chas. Page and Chas. P. Ellis.

LUCKY DOG CON. M. CO., Jan. 28. Location, Sierra county. Capital stock, \$500,000. Directors—Robt. Stuart, S. J. Howard, R. S. Briggs, D. L. Howard and B. R. Low.

DEL MONTE VINEYARD & PACKING CO., Jan. 28. Capital stock, \$50,000. Directors—L. A. Kelley, H. W. Snow, E. Coker, J. J. Harlow and E. E. Burt.

Meetings and Elections.

Annual meetings and elections have been held by the following mining companies:

BELCHER M. CO., Jan. 28: Directors—James Newlands, J. H. Robinson, A. K. P. Harmon, Geo. D. Edwards and J. P. Martin. The following officers were appointed: President, James Newlands; vice-president, A. K. P. Harmon; secretary, Chas. L. Perkins; superintendent, Sam L. Jones, and treasurer, the Bank of California. The appointment of Mr. Perkins to the position of secretary was the only change made in the Board of Officers.

UTAH CON. M. CO., Jan. 29: Directors—H. B. Havens, Geo. R. Wells, Jos. Marks, Herman Zidig and J. J. E. Hawkins. The following officers were appointed: President, H. B. Havens; vice-president, George R. Wells; secretary, A. H. Fish, and treasurer, the Nevada Bank. The financial statement submitted showed a cash balance in the treasury of \$8766.22.

DANGER TO MINERS.—Owing to the long-continued storm and danger of traveling in the snow, there is fear that miners living alone in different parts of the mountains have suffered greatly. During the clear weather several parties have been formed in different portions of the mountains to visit parties living in out of the way places, who had not reported since the commencement of the storm. In two or three cases the people searched for have been found dead, and several were discovered who needed relief. It is feared that many more of the old miners, who have lived alone in the mountains for years, and who stuck to their claims in hopes of striking it rich, have fallen victims to the terrible winter.

The Seattle Relief Committee is using part of the unexpended subscriptions for the relief of the fire sufferers to alleviate the miseries of the poor of that city.

MECHANICAL PROGRESS.

The Railway and the Shop.

The Year's Progress in Improvements.

According to the *Railway Review*, the year just closed has been one of marked progress in all matters pertaining to the motive-power and rolling-stock of the railways of this country. In locomotive practice there is a noticeable change in the style and weight of engines for certain kinds of work. Moguls and ten-wheeled engines are being used to a great extent in fast passenger service, quite a number of roads having, for the first time, put them into regular passenger service during 1889, and several others are giving or are about to give their first order for this class of passenger engines. There are two principal reasons for the adoption of these engines for this work during the past few years; the first is the necessity of greater weight for tractive power, and the second is the more universal realization of the fact that one of the first requisites of an economical locomotive is a large boiler.

A great amount of attention has also been given to compound locomotives in the last 12 months, and at present there are two compound locomotives of American build and design and one of English make running on American railways. When it is remembered that a year ago there was not a compound locomotive running on this continent, and very little interest was manifested in them; that now there are three in operation and a fourth soon to be out of the shops, and that at least three other roads or builders intend to have compounds in operation at an early date, it is evident that the interest is spreading and that this type will receive an extended trial. All these studies and improvements tend toward a greater economy in the movement of trains.

Another practice has made some headway during the year which is destined to have a great effect upon the economies of locomotive running, and that is the instruction of engineers in regard to combustion and the use of steam.

In freight-car construction the tendency toward cars of great capacity is more noticeable than ever. Roads which a year ago thought they had no use for cars of more than 40,000 pounds capacity are either building 60,000-pound cars or are compromising by using 50,000 pounds as a maximum capacity. The dimensions of the axle for these heavy cars have been virtually settled by the M. C. B. standard adopted recently.

The use of so many heavy cars, and the greater speeds of freight trains, have forcibly directed attention to the inefficiency of the hand-brake, and during the last 12 months the automatic air-brake has been applied to a larger number of freight cars than during any other year. The adoption of automatic air-couplers has gone on with surprising rapidity during the year, it being estimated that about 40,000 freight cars were so equipped.

Heating and ventilating are not making particularly rapid strides, except where the law compels action. In train lighting much experimenting has been done with electricity, gas, gasoline, etc. The days of the kerosene lamp are evidently numbered, but just what system of lighting will take its place is not so evident. Train signals, which will take the place of the ordinary bell-cord and gong in the cab, have been applied to a limited extent. Air signals have met with the most favor, though electric signals have been tried.

In shop practice there has been some improvement in handling materials. Overhead power cranes, electric transfer tables, power hoists, and special tools are used in greater numbers. Perhaps one of the most noticeable features is the rapid strides which electricity has made in shop practice. Beginning with the lighting of shops, it has frequently been used to drive transfer tables, and its application is extending to overhead cranes and large isolated tools, or to any other work where the ordinary means of furnishing power are less suitable. There is still a large field for electricity to occupy in railway shop work. There seems to be only one case of flat failure of the application of electricity in railway operation during the past year, and that is as a locomotive traction increaser. It was given a practical trial on one road, but with the exception of a few exaggerated reports in the daily newspapers, no results have been made public, though their appearance has been anxiously awaited.

CAN IRON BE GLUED?—By a new method of cementing iron the parts cemented are so effectually joined as to resist the blows even of a sledge-hammer. The cement is composed of equal parts of sulphur and white lead, with a proportion of about one-sixth borax. When the composition is to be applied it is wet with strong sulphuric acid and a thin layer of it is placed between the two pieces of iron, which are at once pressed together. In five days it will be perfectly dry, all traces of the cement having vanished, and the work having every appearance of welding.

A NOTABLE CASTING.—The Chinese have hitherto excelled in large and exceptionally thin castings; but the following item from the *Chicago Journal of Commerce* would seem to imply feats of an equally, if not more, difficult character than can be performed by our own mechan-

ics: A very remarkable specimen of casting work is on exhibition at the office of Messrs. Charles Himrod & Co., in the Rookery building in this city. It consists of a cylinder six feet high, 20 inches in diameter and only one-eighth of an inch thick. Expert foundrymen have pronounced the manufacture of this casting a notable feat. Its difficult nature will perhaps be better comprehended by the statement that it is equivalent to casting a plate six feet long and about five feet wide and only one-eighth of an inch thick. The casting is perfectly sound and weighs 160 pounds. It was made by Turner, Dickinson & Co., of Chicago, and Calumet pig iron was exclusively used in its production.

Perfect Screws.

The first thing a machinist does when examining a machine tool which he intends to buy is to take hold of the handles which are attached to the various feed-screws, and test the amount of play the screws have in the nut; or, in other words, how much he can turn the handles loosely without moving the slide or the carriage. Seldom he has anything to say after this test. Is it because he has never found a screw absolutely without play, or does he know that the accuracy of his work which he intends to do on the machine does not, in most cases, depend on this difficulty? If you go into a shop and make this same test on the various machines, you will probably be quite surprised how much back lash the screws have, either by worn threads or end play between collars. The screws are hardly ever replaced by new ones until they refuse to move the slide at all, and yet the men are turning out good work. This is especially true in busy times. While it seems that a screw with much play in working operation is not a serious objection, it is quite an objection on a new machine with little play.

Supposing we make a screw with a compensating nut, whereby it is possible to adjust the nut in a very sensitive manner, to take up the lateral play completely, then run a screw through it 24 inches long forward and back two or three times. Examination will show that the nut needs more adjustment. This difficulty is due to the irregularity of the screw-threads. Every time the thicker threads pass through the nut it will wear it to a certain extent, and there will be play on some portions of the screw. Now, then, the question arises, is it possible to produce a perfect screw on lathes, as they are built for the market at present? In the first place, I do not think that two lathes are made with lead screws alike.

Supposing we have two lathes with perfect screws, it is questionable whether two screws chased on these two lathes would be exact duplicates, or that the finished screws changed from one lathe to the other would not show variations by passing a tool through them. I am of the opinion that lead screws on all lathes are too small in diameter. They are subject to a certain amount of twisting strain, and will in due time get out of true, especially if heavy cuts have been taken.

There should be a lathe built specially constructed for chasing accurate screws, in which one would not be dependent on the give of the various joints between the feed-nut and the cutting tool. On the present lathes the lead screws are too far away from the tool, the leverage being too great. A lathe for the above-mentioned purpose need not have more than six inches swing, the spindle should be close to a rigid head, and the lead screw located in the rear on the top of the carriage, where it can be covered partly and kept clean; and last, but not least, the tool brought close as possible to the same. We all know how important it is to have the two screws on the plunger, which elevate and lower the saddle alike, in order to keep it parallel with platen at any height. The shape of the threads seems to be an unsettled question among lathe-builders. We use lead screws all the way from the U. S. Standard V (flat top and bottom), to perfectly square threads. I hope to see the day when lathe-builders will make lead screws uniform with correct threads. I would like to see this subject thoroughly illuminated, and am sure whatever may be said by our mechanical brethren who have had the benefit of special experience in this line will certainly be appreciated by the readers of this paper.—*American Machinist*.

THE OTHER SIDE OF THE WATCH-SPRING STORY.—"If you want to make the most out of a little," said the jeweler, "buy a pound of steel and work it into hair springs for watches. The product will sell for \$140,000." "And then I would be \$140,000 in," said the apprentice, who had enough laid by to get the pound of steel. "No," replied the master; "it would cost you about \$139,000 and all your life to make the springs."—*R. J. Burdette*.

The quickest way to harden iron, if in small sizes, is to heat it to a cherry red, then sprinkle upon it some cyanide of potassium, and heat it to a little above red, and then dip. Cyanide of potassium is a deadly poison.

A SINGLE BELT running at the rate of 800 feet per minute, or a double belt having a running rate of 500 feet per minute, will transmit one horse-power for each and every inch of its width.

SCIENTIFIC PROGRESS.

Thermal Repulsion.

The well known publishing house of John Wiley & Sons, 15 Astor place, New York, has recently issued an anonymous volume of 60 pages, entitled "The Cosmic Law of Thermal Repulsion," a somewhat singular production, the general merits of which, although anonymous, are sufficiently guaranteed by the standing of the publishers. The book sets forth positions in philosophy both startling and full of interest. It claims to be "an essay suggested by the projection of a comet's tail," and the subject-matter is thus tersely introduced: "Thermal repulsion, like gravitational attraction, is universal between masses as well as between molecules of matter." The origin of the book is thus described:

"The immense projection of the tail of the great comet of 1832 led me to suspect that the phenomenon resulted from an outward push exerted by the radiant energy of the sun on the matter of the comet, and that the matter which thus yielded to the push and was projected outward was that portion of the comet which had become superheated as the body approached the sun. The force causing the outward projection evidently came from the sun; the matter projected had been reduced to great tenuity; the form of the tail indicated that the outward push was exerted against the entire body of the comet, and that the particles projected yielded to the force as they became surcharged with the sun's radiant energy. This explanation involved the hypothesis that the expansive force of heat was not confined to moving outward the molecules of a separate mass of matter, as in the ordinary phenomenon of expansion, but that it was operative between the sun and bodies in space; in other words, that thermal energy exerted on all matter a push outward from the center of gravity, just as gravitation exerts a pull inward toward the center of gravity.

"Further reflection during subsequent years strengthened my belief in the truth of this hypothesis; and recent advances in physical science furnish evidence which appears to me to be sufficient, when considered in connection with other well-known physical phenomena, to prove the existence of the supposed cosmic law.

The Primary Principle Deduced from the Foregoing Passage.

"In attempting the induction of a Cosmic Law from the phenomena of nature, it is of course necessary to consider the whole subject of nature; and in doing so, the first thing which strikes the attention is the difference between those things in nature which are matter and those things which are not matter. For instance, the table on which I write, and the pen, ink and paper with which I write, are matter; but the intelligence which directs the pen in making letters on the paper is not matter. It is force imparting motion to matter."

This forms the key-note to the entire book, introducing philosophical deductions, of which the following are some of the head-lines: "The Operations of Natural Forces;" "The Field of Operation of Natural Forces;" "Forms of Matter;" "The Earth's Attraction on Liquids and Gases;" "Effects of Gravitation on Molecules of Gas;" "Effect of Heat on Matter;" "Conjugal Antagonism of Heat and Gravity;" "Gravitation and Thermal Energy on Meses of Matter;" "Planetary Matter—Comets;" "Motion Imparted by Heliofugal Power Resisted by Cohesion and Gravitation;" "Outward Push of Heliofugal Power;" "Heliofugal Power Causes Planets to Revolve;" "Difference in Speed of Axial Rotation."

The result of the author's studies upon these varied topics is summed up as follows:

"The well-known phenomena of nature which we have been considering demonstrate that there is an essential difference between matter and force in the constitution of Nature; that force is not in one form, but in many forms, and that two of these forms or manifestations of force, heat and gravitation are ever present and in active operation where matter exists; that these forces operate on the molecules constituting a separate mass of matter, the force of gravitation being a pull inward toward the center of mass, and the force of heat being a push outward from the center; that outward and inward motion of the molecules is the result of the predominance of the one or the other of these forces, and that the motion (contraction or expansion) is uniform, except when intercepted by some other force; that the inward pull of gravitation between separate masses of matter is identically the same as the pull between the molecules of a single mass; and that, while it has not yet been fully demonstrated, we are justified in assuming that the outward push of heat is the same between separate masses of matter as between the molecules of a single mass. This being true, it follows that all matter in nature is held suspended between these two forces of attraction and repulsion. Within the earth itself Nature has stored up heat more than ample to reduce all forms of matter to the most tenuous gas, and the immense outward push of this vast self-acting boiler counteracts the inward pull of gravity; and thus it is that thermal repulsion and gravitational attraction hold in position the very ground beneath our feet. The

end of the world, as we know it, would come by an explosion or contraction, if either of these forces was suspended for an instant."

CHINESE THEORY OF EVOLUTION.—The idea of evolution is not altogether a modern conception. In this domain of research, the Chinese, as in almost everything else, come to the front. Adele M. Fiedle in *Popular Science* describes the Chinese idea as follows: "The rocks are the bones of the divine body the soil is the flesh, the metals are the nerves and veins; the tide, wind, rain, clouds, frost and dew are all caused by its respirations, pulsations and exhalations. Originally the mountains rose to the firmament and the seas covered the mountains to their tops. At that time there was in the divine body no life besides the divine life. Then the waters subsided; small herbs grew, and in the lapse of cycles developed into shrubs and trees. As the body of men, unwashed for years, breeds vermin, so the mountains, nerved by the seas, bred worms and insects, greater creatures developing out of lesser. Beetles in the course of ages became tortoises, earthworms became serpents, high-flying insects became birds, some of the turtle-doves became pheasants, egrets became cranes, and wildcats became tigers. The praying mantis was by degrees transformed into an ape, and some of the apes became hairless. A hairless ape made a fire by striking crystal upon a rock, and with the spark struck igniting the dry grass. With the fire they cooked food, and by eating warm viands they grew large, strong and knowing, and were changed into men."

THE STUDY OF ECLIPSES.—The physicist and astronomer, says a contemporary, have of late become more closely related in their work. In old times the observations of eclipses were principally for the determination of data of time. Recently the constitution of the sun and the corona surrounding it have been one of the principal objects of eclipse observation. Recent progress in photography lends itself admirably to this line, and the work done during the present eclipse has been largely accomplished by photographic methods. The corona is the circle of rays that is seen emanating from behind and all around the moon when the sun is totally eclipsed. Its exact nature is unknown. Various theories have been advanced. It has even been attributed to a lunar atmosphere. It is, however, tolerably certain that it has a real and objective existence. It cannot well be regarded as a reproach to modern science that we know so little of it. We are on the average granted but a few hours in a century in which to see it. The late eclipse of Dec. 23 did not afford much opportunity for observation. Its path was unfortunate and the weather at the various points selected for observation was anything but favorable. Accounts from the American party in Africa, however, indicate fair success. Seventy photographs were secured before totality, and nearly as many after totality. Clouds interfered with the work during totality.

DIFFERENT HEAT CONDUCTING POWERS OF METALS.—If we hold the end of a rod of silver in one hand, and one end of a rod of iron in another, and place the opposite ends in a fire, we soon become aware that there is a great difference in the heat conductivity of the two metals. The following table shows the relative conducting power of the several metals named. The differences observed will no doubt be a surprise to many:

Silver.....	100	Iron.....	12
Copper.....	74	Lead.....	9
Gold.....	53	Platinum.....	8
Brass.....	24	German Silver.....	6
Tin.....	15	Bismuth.....	2

CONTROLLING THE BOUQUET OF WINE.—It appears that the flavor of a wine depends less on the nature of the soil in which the vines have been grown than on the ferment employed. The wine ferments which have hitherto supposed identical, and which have received the name *Saccharomyces ellipsoideus*, are various, and communicate different qualities to the most in which they set up fermentation. The juice of the "chasselas" grapes of the south of France can, by a change of ferment, be made to yield high-class (*grands crus*) Burgundies.—*A. Rommier*.

AN AEROLITE AT SEA.—The ship *Glaucine*, which lately arrived at New York from Newcastle, had a narrow escape from a falling meteor at 1:20 P. M. on December 10th, while off "Crocodile Head." A heavy thunder-storm was raging when a sharp report was heard, followed by a sharp, whizzing noise directly overhead, and simultaneously with this an aerolite was observed to drop into the sea in dangerous proximity to the vessel. The splash of the substance sent the water flying to a height of 80 feet or more.

ECONOMY IN COMBUSTION.—The absence of thick, black smoke from a furnace is not evidence of a perfect combustion. The amount of carbon passing off even in the heaviest and blackest smoke is quite small when compared to the loss which may arise from the escape of almost invisible unconsumed gases without the appearance of black smoke.

In Sweden a new elevator loads a 2500-ton vessel with iron ore in a day.

GOOD HEALTH.

The Prevailing Disease.

The prevailing disease, "la grippe," is still holding sway over most parts of Europe, as well as the United States. In this country, and especially on this coast, it seems to have taken on a much milder type than elsewhere. Contrary to common report, it is no respecter of persons—it extends its grip to all alike, rich or poor, learned or unlearned.

Although it is no new thing, still its characteristics and mode of treatment do not seem to have been so carefully studied during any of its former manifestations as during the present one.

Its Germ Origin Proven.

One of the most important discoveries connected with its present manifestation is the quite generally conceded fact that it is produced by "bacteria," and quite recently, by telegraph, from Vienna of Jan. 22d, we are informed that two physicians of that city, after some two months of study and research, have succeeded in discovering the particular "bacillus" which is producing the "grippe." It is described as new, and differing materially from any heretofore discovered. Its distinguishing mark is the form of the head, which is mitre-shaped. Hence it is called Bishop bacteria. This unwelcome visitor is, moreover, said to be the most active of all the microbes yet discovered, it being almost impossible for the eye to follow its movements even with the aid of the most powerful microscope. From the marvelous activity which, it is reported, they show in their movements, one can readily imagine the destruction they can cause when once they secure a lodgment in the human system. The chief of the two discoverers has been for six years professor of bacteriology at the University of Wurtemberg. He has succeeded, with these microbes, in producing influenza in rabbits by inoculation, thus proving the genuineness of this discovery.

In his researches to learn the source of these microbes, he soon found them in water from a well in the Syrian mountains, more than 300 miles distant from Vienna. Not less than 228 specimens were counted in a half cubic inch of that pure mountain well-water.

Nature of the Disease.

An eminent retired Boston physician has quite recently given to the Boston Herald some interesting and especially valuable information as to the nature and treatment of the disease which is well worth consideration. He says the malady is not a disease proper, but a disorder, and confined chiefly to the nervous system. It is a safe, but a very uncomfortable, disorder. It does not cause pneumonia; but it increases the susceptibility, in the old, feeble and young, to the attack of that malady. It is the old-fashioned malarious fever, not at all dangerous of itself. It is not contagious. A person exposed in any way to its peculiar microbes is liable to its attack. The disease does not manifest itself with invariable symptoms. In some persons it appears as a true fever—"little fever"—and the air passages are not affected. In others, there are all the distressing manifestations of a severe "cold in the head." In the fever type, quinine acts well—in large doses—and is a safe medicine to give. In other types but little good is derived from it.

The Treatment of the Disease.

According to this physician, is recommended as follows:

As soon as one feels the first symptoms, he should at once go home, either take a hot, full bath or foot bath, and get into bed and stay there for three days. This matter of confinement to bed for the length of time stated is an important one; there would be some danger in leaving it sooner. He will do well also to send for a physician; but if he must treat himself, let him take acetanilide. It is safe if used in anything like reason. Druggists have on sale five-grain tablets of this medicine. An adult may take one tablet every hour, if needed, for several hours. Acetanilide lowers the fever and relieves the pain in the head and body, and it also quiets restlessness. Probably the good effects of the drug will be apparent after the second or third dose. If so, it need not be taken oftener than two, three or four hours, as the case may be. If the attack does not yield within six hours, one tablet of acetanilide may be taken every hour during that time. After that, it is best to dose a little less often and take a tablet, say, every three or four hours if needed. As soon as improvement is noted, the intervals between the doses should be lengthened, and discontinued altogether as soon as the fever is rapidly abating and the pains are subsiding. Some time during the first 24 hours, it will be well to take a purge; two or three compound cathartic pills will act freely.

As to the dietetic treatment, the starvation sort is the best, at least for persons attacked while in fairly robust health. Milk will meet all the requirements. Stimulants are forbidden, except, of course, they are ordered by a physician. The headache in "influenza" is not likely to yield until the associate symptoms have abated. Some relief can be obtained from an application of menthol—one drachm in ten drachms of alcohol. This should be applied with a small sponge. Hot foot baths administered once in six or eight hours at first have

some good effect, easing the head a little and tending to quiet the restlessness. Mustard pastes can be applied to the back and other painful parts.

As to Preventive Treatment.

It is a positive fact that those who live generously and exercise but little, and so allow their systems to become choked up with waste, are the most liable to take cold. It appears, also, that those who take cold the easiest are the readiest victims to the prevailing distemper. Hence to eat lightly and only of simple and easily digestible foods, would suggest itself as one of the important essentials. To exercise freely in the open air is another. The bowels should be active. If they are naturally so, they need not be interfered with; but if not, they should be stimulated by laxative foods, fruits, etc., or by some gently acting medicine. Hot drinks, be they tea, coffee or alcoholic stimulants, should be eschewed. To dress properly, live in pure air, and be discreet under exposure, are other essentials to health, and so are important as preventive measures. The medicinal treatment recommended in the foregoing is for adults only.

USEFUL INFORMATION.

THE PROCESS OF CLEANING CLOTHES.—The mystery to many people how the scourers of old clothes can make them almost as good as new is explained in the *American Analyst* as follows: Take, for instance, a shiny old coat, vest or pair of pants of broadcloth, cassimere or diagonal. The scourer makes a strong, warm suds, and plunges the garment into it, soaks it up and down, rubs the dirty places; if necessary, puts it through a second time, then rinses it through several waters and hangs it up to dry on the line. When nearly dry, he takes it in, rolls it up for an hour or two, and then presses it. An old cotton cloth is laid on the outside of the coat and the iron passed over that until the wrinkles are out; but the iron is removed before the steam ceases to rise from the goods, else they would be shiny. Wrinkles that are obstinate are removed by laying a wet cloth over them and passing the iron over that. If any shiny places are seen they are treated as the wrinkles are—the iron is lifted while the full cloud of steam rises and brings the nap up with it. Good broadcloth and its fellow cloths will bear many washings, and look better every time because of them. The same treatment may be applied to women's dress goods. If all wool, they may be renovated to look like new.

THE DEFALCATIONS OF ROGUES during 1889, in the United States, each of whose stealings have equaled or exceeded the amount of \$100,000, aggregate \$8,562,753, or an average of \$329,813 each. The number of these big rogues was only 23. If to them were added all the minor rogues, who have stolen less than \$100,000 each, the general aggregate would probably be more than doubled, giving a sum equal to the total expenses of the Navy Department for the past year, or fully half that of the War Department. It does seem as though such an immense aggregate of thieving should and might in some way be reduced. The proposed closing of the Canadian thief quarters, if carried out, will probably effect some reduction during the present year.

INCREASE OF WEALTH.—The \$40,000,000 left by John Jacob Astor, in 1849, has grown to \$200,000,000. If this property continues to increase at the above rate for 40 years more, it will aggregate \$1,000,000,000! And why should it not thus continue? This, like many other wealthy families, have adopted a policy to secure their chief accumulations to the heads of their respective families. Experience shows that such fortunes are not widely distributed. Have our statesmen given a due consideration of what will be the result of such or even an approximate accumulation in the hands of say 50 of our present most wealthy families within the next 50 years?

HOISTING ROPES.—Oiling a hoisting rope, which is exposed to the weather, may possibly give it a longer life, yet as a drawback it is certain that it induces a species of heating and tends to spontaneous combustion. On ships, standing rigging or ropes are tarred, to preserve them; but all running rigging is left in its natural state. Wire hoisting ropes are now made with hemp cores, which are said to be very durable.

PREPARING MILK FOR SHIPMENT.—A Chicago chemist has devised a method of so preparing milk, after a small portion of the water has been removed from it, that when so purified and refined, it will keep sweet for fully 30 days, and can be shipped anywhere, and when the water has been replaced, is in as good if not better condition as when it left the cow, and cannot be distinguished from milk six hours old.

DIGGING EARTHWORMS.—Some one who has had experience says: "I supposed every one who, when a boy, dug earthworms for bait fishing, was familiar with the fact that they will come to the surface if the ground is thumped. Whether they do so thinking it is rain or because, as I think more probable, they find the vibration uncomfortable, I do not know."

ENGINEERING NOTES.

Ancient Engineering.

We talk a great deal about the wonderful achievements of modern times in canal building, tunneling and other excavations, too often forgetting or considering of little account ancient achievements of like character.

Diverting the Euphrates.

The earliest work of magnitude of this character of which we have any direct knowledge is probably the turning of the Euphrates by Cyrus as a means for his entry into Babylon. This work was determined upon only after a two years' siege. The great depth and width of this river are sufficient to stamp this piece of engineering work as one of vast magnitude and no little difficulty, to say nothing of the fact that its accomplishment led to the downfall of the mightiest city of ancient, or perhaps of modern, times.

The Next Great Feat

Of this kind was accomplished by Xerxes, 480 B. C., who cut a canal across the isthmus of Mount Athos to facilitate his conquest of Greece. The work was herculean in character, especially when we consider the inefficient means for snub work at the command of the engineers of those days. His fleet of over a thousand ships was enabled to pass through and thereby avoid the dread dangers of the stormy promontories which had been the ruin of so many ships before his day.

The Original Suez Canal.

We can say but little of this work, as we know of it only by the excavations which were found by the engineers of the present canal, which follows very nearly the course of the old one. In regard to when or by whom that great work was accomplished, history is silent.

The Drainage of the Valley of the City of Mexico.

As is well known, the City of Mexico is situated in a deep valley, surrounded by mountains everywhere except at one point where a narrow canyon furnishes a limited outlet for the immense body of water which flows into that valley, especially during the heavy rains which sometimes almost deluge the city and its surroundings. This great danger and discomfort to health and commerce was seen and felt by the early Spanish invaders who took possession of that ancient city, and measures were taken to abate it. The first plan adopted to accomplish this work consisted of an attempt to divert the waters of one of the principal rivers from its natural channel to the outer slope of the watershed and thus prevent their reaching the plain of the city. To effect this, a channel had to be dug and a tunnel over three miles in length had to be excavated. The work was completed, but it failed to accomplish the purpose desired on account of the tunnel becoming constantly choked with debris. This trouble was remedied by converting the tunnel into an open cut. The original work was begun in 1607, but the open cut was not completed until 152 years later. During the accomplishment of the first work it is said that 470,000 natives were employed, and 50,000 perished from sickness and casualties. In the after-work of converting the tunnel into an open cut, the labor was enormous. The length of the cutting was about 13 miles, and for the distance of nearly a mile through the rocky divide, the width of the opening at the top was from 270 to 360 feet, and the perpendicular depth from 147 to 196 feet. For the distance of nearly 3 miles, the depth was from 93 to 164 feet. Humboldt visited and examined this work in 1804 and found the width of the channel at the bottom to be from 9 to 13 feet, with side slopes from 40° to 45°. Such work accomplished at that age of imperfect appliances was truly wonderful and may well be compared with the Suez or any other canal work of the present day.

A New Electric Storage Battery.

A patent has recently been granted to Messrs. Bradbury & Stone of Lowell, Mass., for a new storage battery which it is claimed presents decided advantages over any one now in use. The same principle of construction is used in this battery as obtains in most storage batteries, except in the manner of construction of the plates which are inserted in the acid. Here lies the secret of their battery, which they claim can be built 25 per cent cheaper than any other battery, while 25 per cent more power can be developed from it. The construction of the plates is peculiar. The size of the plates is but 6 1/2 inches, while some 36 or 38 feet of lead, in strips, is so braided or looped in tiers that the liquid acts upon both sides of the plate or a surface of 72 or 76 feet. Before putting the plates into the battery-jar, the innumerable number of pockets on either side of the plate are filled with powdered oxide of lead, which after being pressed hard, the plates are placed into the acid in the jar and the current turned on simultaneously, thereby hardening the oxide of lead and making all plates solid and stiff. The idea is to get a plate with a large surface, which is obtained by this method of getting pockets on each side and so held together that should a strong resistance pass through the wires connected with the batteries, the plates would not buckle or the plugs fall out. The great trouble in the matter of build-

ing storage batteries has been to overcome the swelling of the plates, buckling and plugs coming out. Some time ago the first difficulty was overcome; and now Messrs. Bradbury and Stone have cleared away and do away with the last two troublesome points. The invention comes forward as the lightest battery of its kind and capability yet invented.

AN ELECTRIFIED TREE.—The residents of Wilmington (Del.) were recently very much agitated over the peculiar condition of a maple tree which stood in one of the public streets of that town. It was observed that whenever any one touched the tree, a slight electric shock seemed to be imparted to the person. The small boys after fooling with it awhile concluded to let it alone. The same disposition seemed to seize upon the older citizens when they came to investigate. The force of the shocks seemed to grow stronger from day to day until the tree became the wonder of the city and all the neighboring country. Finally some one of an investigating and scientific turn of mind came along, and on looking into its branches noticed that several insulated electric wires passed along, near and against some of its upper branches. This gentleman solved the mystery at once. The insulation of the wires had become softened by the frequent late rains, and by constant rubbing had brought the wires in direct contact with the green branches, which attracted a portion of the current and carried the same to the ground. Although the current thus conveyed was not sufficient to injure a person, yet it was quite sufficient to conjure up a seven-days' wonder for the usually quiet town of Wilmington.

AS THE MANCHESTER SHIP CANAL approaches completion, a number of similar projects are being brought forward to connect other interior cities with the coast.

GERMANY'S floating exhibition will visit 80 ports on its world's trip. It is a much grander affair than our "California on Wheels."

ELECTRICITY.

UNDERGROUND WIRES FOR SAN FRANCISCO.—John I. Sabin of the Pacific Bell Telephone Co. appeared before the Street Committee of the Supervisors for this city and urged that a favorable report be made on the petition of the corporation for a franchise to lay their wires underground. Mr. Sabin explained the system of laying the wires in conduits. He said it was proposed to adopt the system now in use in Chicago. The conduits would be large enough for telegraphic and telephonic purposes. They would be eight inches square, and would hold 600 wires. It may be interesting to know, in this connection, what is being done in New York in regard to putting the wires in that city underground. From an exchange we learn that the proportion of electric-light wires in New York city which have already been laid in the subways to those still remaining overhead is about as follows: The United States Illuminating Company, with about 600 miles of live and dead wire above ground, has 50 miles of subway wire, of which 15 miles are working. The Manhattan Company, with about 200 miles of wire above ground, has 26 miles of subway wire, of which 26 miles are working. The Mount Morris Company has about 30 miles of overhead wire, and 1.25 miles in subways, all working. The Brush Company, with about 600 miles of overhead wires, has 35 miles in subways and already uses 19 miles. The East River Company has about 200 miles of wire overhead, none underground. The Edison Company, incandescent and low tension, has every mile of its 232 miles of wire in subways. January 1st last there were 5196 miles of wire of all sorts in use in subways. On October 1st the subways held 9649 miles of wire in use.

BUYS A MINE.—George Westinghouse now requires so large a supply of copper in his various lines of business, particularly in his electrical works, that he has recently bought a valuable copper mine in Arizona, from which he proposes to obtain his own supply of copper. His electric company alone uses several million pounds of copper every year in the manufacture of electrical machinery, and by having its own mines the saving in the cost of copper will amount to a considerable sum each year. It is also intended to get beyond reach of the proposed Lake Superior copper syndicate. The mine will give employment to about 300 men.

EXTENT OF ELECTRICAL WIRES.—A French electrical journal estimates that the total length of the telegraph wires (including submarine cables) of the world in use at the present time exceeds 500,000 miles. Four-fifths of the land wires are in Europe and America. All the submarine cables together give a length of 89,050 miles.

THE ELECTRICAL INDUSTRY.—The Edison Machine Works at Schenectady, N. Y., already employ some 1300 men, and when the extensions are completed probably twice that number will be required. It is estimated that 250,000 persons in the United States are engaged in business depending solely on electricity.

Four telegraphic messages can now be transmitted over one wire at one time by using the quadruplex system.

Passing Events.

The storms in the mountains have continued, greatly hindering mining operations and doing great damage. In most of the mining sections the shipment of ore to the mills is impossible, owing to the state of the roads, and very little work is being done. There have been no bullion shipments for weeks.

There has been daily expectation that the snow blockade on the Central Pacific would be broken, but it has lasted over two weeks, and it was not till Thursday night the trains were released from the snow. Immense damage has been done to railroad property in California, there having been slides, caves and washouts in all directions. Many bridges have been washed away on all the roads. It is not thought the Oregon road will be cleared for weeks.

We give this week considerable space to a review of mining operations for 1889. Much statistical information is placed before our readers which will be useful for reference.

Fears are felt for the safety of isolated miners in the mountain counties, owing to the severe storms. Already there are reports of the death of men who were snowed in and unable to get provisions or assistance.

The mines and mills at Grass Valley are gradually resuming work. The North Star has resumed milling operations, with 20 stamps, by means of water obtained from the Greenhorn ditch.

Mining in 1889.

Progress and Condition of the Industry.

The past year has been a prosperous one for the mining industry of the Pacific States and Territories. The output of bullion aggregates \$127,677,836, against \$114,341,592 in 1888. This is the largest annual product ever made. It must be remembered, however, that the lead and copper outputs have increased greatly of late years, especially in Montana, Idaho, Utah and Colorado.

The following is Wells, Fargo & Co.'s annual report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia, and receipts by express from the west coast of Mexico) during 1889, which shows in the aggregate: Gold, \$32,974,643; silver, \$65,316,107; copper, \$14,793,763; lead, \$14,593,323. Total gross result, \$127,677,836. The "commercial" value at which the several metals named herein have been estimated, is: Silver, 94 cts. per oz.; copper, 10 cts. per lb.; and lead, \$3.80 per cwt.

STATES AND TERRITORIES.		Gold dust and bullion by express.	
California	\$9,330,044	\$330,000	
Nevada	3,082,053	100,000	
Idaho	634,633	20,000	
Utah	112,000	20,000	
Montana	3,204,600	20,000	
Colorado	4,600,000	20,000

1889	218,000,000	1889	218,000,000
1890	228,000,000	1890	228,000,000

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, \$30,232,914; from San Francisco, \$13,422,338. Total, \$43,655,252, as against \$43,000,018 last year. Pounds sterling estimated at \$4.84.

As in former reports, allowance must be made for probable variations from exact figures, by reason of constantly increasing facilities for transporting bullion, ores and base metals from the mines outside of the express, and the difficulty of getting entirely reliable data from private sources.

Especially is such the case in the reports from Montana and Colorado. Statistics gathered in this way are liable to be exaggerated; but, with some modifications on this account, already made, the final general results reached may be expected as approximately correct.

The following showed gains in product last year over 1888: California, Oregon, Washington, Alaska, Idaho, Utah, Colorado, New Mexico, Arizona and Dakota; both Montana and Nevada show a decrease. Montana's figures for last year were \$32,376,000, and this year \$31,726,923. Idaho shows the most marked advance, having produced this year \$17,344,600, against \$5,685,000 in 1888. Her lead product increased greatly last year. California shows an increase from \$12,063,488 in 1888 to \$12,842,757 in 1889. Still the actual yield of metallic products is even greater for this State, since it yields a number of other substances not noted in the table. For instance, no other State produces quicksilver, and California last year turned out 25,650 flasks, valued at \$1,154,000. In addition, we mine chrome, actinomy, borax, coal, copper, gypsum, salt, and numerous other things. The petroleum interests of the State are also very large.

Mining Dividends.

It is rather difficult to obtain any reliable statistics of mining dividends even of the incorporated companies. Much of the incorporated dividend-paying concerns are now in Colorado, Montana, Michigan and Idaho, owned and operated by Eastern companies, and the records are not always reliable. In California much of the money comes from unincorporated companies, and the dividends are quietly divided without any advertising or publication, so it is impossible to get any record of them at all. In fact, such matters are kept quiet, as any ordinary business is. The mines, of which there are many owned by individuals, or a few persons, are in the same category, and no information is given as to the profits derived. It is, therefore, difficult to give any accurate figures regarding the profits of mining, especially in California, and the amounts appended are only those of incorporated companies. The statistician of the Bulletin has gone carefully over these figures and endeavored to obtain something reliable, but, as stated, they only refer to incorporated companies, the private mines being omitted entirely.

In Alaska there is only one mine that has paid a dividend—that is, one "company" mine. The Alaska N.-M. paid regular dividends of 25 cents a share through the year—\$300,000 for 1889. This mine has paid altogether in dividends \$650,000.

In Arizona, the Copper Queen mine paid one dividend of \$70,000 in 1889. This mine paid its first dividend in 1881, and the total to date is twenty-two dividends of \$1,410,000, of which \$210,000 is credited to the present management in the last two years. There were no dividends in 1885, 1886 or 1887.

Dividends.		Amount.	
Champion	3	\$30,000	
Delhi	5	50,000	
Derbec Blue Gravel	3	20,000	
Idaho Quartz	11	1,000	
Napa Co. Q.	5	50,000	
North Star	2	20,000	
Plumas Europa	2	123,016	
Quicksilver	2	103,107	
Young America	1	10,000	
Totals	35	\$702,163	

The Idaho dropped out one dividend because of a fire in the mine. The number of mines is about the same as in 1888, but the names are not the same, as the Plymouth Con, Sierra Buttes and Standard Con were dropped out last year and the Champion, Derbec Gravel, Napa and Young America added. The Sierra Buttes is reported as practically worked out. Forty of the sixty stamps of the Yuha mill company have been moved to another mine in Shasta county belonging to the same English corporation.

Of course there are hundreds of other mines in the State paying well, but they are owned by individuals and no record is made public. The Chippe Flat mine, for instance, yielded \$100,000 to the work of two men; and the Stonewall, in San Diego, belonging to Governor Waterman, pays \$20,000 a month, but these, like many others, are not mentioned in the lists of dividends.

The dividend record of the Colorado mines of 1889 is as follows:

Dividends.		Amount.	
American & Nettie	6	\$200,000	
Aspen M. & S.	3	320,000	
Boston & Colorado Smelting	3	150,000	
Calliope	5	50,000	
Colorado Central	4	55,000	
Compromise	1	126,000	
Dunkin	1	40,000	
Evening Star	2	25,000	
Hubert	1	5,000	
Iron Silver	1	100,000	
Ivanhoe	1	10,000	
Matchless	1	5,000	
Morning Star	2	50,000	
New California	1	20,522	
New Weston	3	187,500	
Poorman	1	15,000	
Puzzler	1	1,050	
Silver Cord	1	60,000	
Small Hopes	1	25,000	
Ward Con.	2	20,000	
Totals	40	\$1,606,072	

There are several mines in the above list that paid their first dividend last year. This was the case with the American and Nettie mine at Ouray. Its first dividend of \$30,000 was paid last July. The local paper speaks of it as one of the wonders of the gold belt. Another is the Compromise, which is reported to have paid a dividend of \$126,000 last July. The Ivanhoe paid its first dividend in June, Calliope and New California in August, and Puzzler in October. The Boston and Colorado Smelting is capitalized in the sum of \$1,000,000. It paid regular dividends of 2 1/2 per cent in March and July and an extra one of ten per cent in April. The Small Hopes was once the leading dividend mine of Colorado. The single dividend by that mine last year makes the total \$3,087,500 from the start. The following Colorado mines paid in 1888, but not in 1889: Eliphe, Leadville, Little Chief, Mary Murphy, Mascott and Swansea. But against these, six dropped out; nine were added.

The dividend mines of Dakota in 1889 were as follows:

Dividends.		Amount.	
Caledonia	10	\$30,000	
Hoe estate	12	187,500	
Monitor	3	37,500	
Totals	25	\$305,000	

The Caledonia mine resumed dividends in November, 1888, and paid for 12 consecutive months before stopping—the best the mine has ever done. In all it has paid \$138,000, and the stockholders believe there are other dividends to come. The Homestake is a veteran in the dividend line, having paid nearly \$450,000 to all.

The dividend record in Idaho Territory, so far as advised, is as follows:

Dividends.		Amount.	
Alma Con.	1	\$15,000	
Coeur d'Alene	4	70,000	
Deer Creek	1	10,000	
Granite	1	20,000	
Sierra Nevada Con.	1	20,000	
Totals	8	\$135,000	

The dividend of the Alma was paid last January. Two dividends of the same amount were paid previously. The Coeur d'Alene paid its first dividend of three cents per share last July. This was followed in August with one of four cents, and again in September, and then one of three cents in November, making \$70,000 in all. The Deer Creek paid its first dividend of 5 cents per share, or \$10,000, in 1888, and its second of the same amount last June, making \$20,000 in all. The Granite paid two dividends of \$10,000 in 1888, making \$20,000 in all. The Sierra Nevada Con. paid \$20,000 in 1888, and the same amount last year, or \$40,000 in all.

Following is a list of the dividends of the Michigan copper mines for 1889:

Dividends.		Amount.	
Atlantic	1	\$30,000	
Calumet and Hecla	3	1,500,000	
Central	1	40,000	
Franklin	1	50,000	
Oscoda	1	50,000	
Quincy	2	250,000	
Tamarack	4	640,000	
Totals	12	\$2,070,000	

These properties have paid better than any corresponding number of silver mines taken at random in any part of the country. The Calumet and Hecla has paid \$32,850,000. There is only one other mine in the history of this country that has a better record for dividends, and that is the Consolidated Virginia, which paid \$42,930,000 up to August, 1880. The next best record was that of the California, adjoining the former, which paid \$31,320,000 up to December, 1879. Those mines were subsequently consolidated, and under the new organization over \$3,000,000 more has been paid.

There are some lead mines in Missouri, but the only one credited with a dividend for 1889 is the Wehli City, which paid its first four monthly dividends of \$1100. The Pelican Eagle also paid two dividends of \$5000 each.

The dividend mines of Nevada for 1889 were as follows:

Dividends.		Amount.	
Con. Cal & Virgin's	10	\$554,000	
Confidence	1	34,000	
Cortez	1	160,000	
Jackson	1	5,000	
Mt. Diablo	2	40,000	
Navajo	3	30,000	
Pimlico	3	30,000	
Totals	21	\$1,143,960	

The Cortez paid its first and only dividend last May. It is incorporated in London. All the others have paid dividends in previous years. The record of dividends in 1880 by the Montana mines is annexed:

Dividends.		Amount.	
Allee	1	\$25,000	
Bozeman & Montana	5	625,000	
Cumbarland	1	15,000	
Granby	1	20,000	
Granite Mountain	12	2,400,000	
Hecla	12	180,000	
Iron Mountain	1	20,000	
Jay Gould	6	74,000	
Lexington	1	64,000	
Montana Limited	2	203,250	
Original	1	3,000	
Parrott	1	180,000	
Pyrenes	1	5,600	
Totals	45	\$3,714,250	

The Comberland paid its first dividend in December. The Granby M. and Smelting paid its first and only dividend in the early part of the year; Iron Mountain, its first and only dividend in December, and Pyrenes, in March. The Granite Mountain shows the largest dividend record of all the Montana mines, having paid \$7,800,000 to date.

The Illinois paid its second dividend of

\$20,000, last April. It paid \$25,000 in 1888 or previously. The Silver Mt. Co. of Las Vegas paid \$25,000 in 1888, and the same amount in June, 1889. Under its former name of Sierra Grande, previous to 1888, it paid \$860,000.

Following is the record of dividends of Utah mines in 1889:

	Dividends.	Amount.
Daily	12	\$150,000
Horn Silver	1	50,000
Mammoth	6	120,000
Ontario	12	200,000
Woodside	1	25,000
Totals	31	\$1,545,000

The Woodside paid its first and only dividend in October. The Horn Silver resumed dividends in December after a lapse of several years.

A summary of the above dividends, with comparative yearly totals, is annexed:

Mines.	Dividends.	Amount.
Alaska	1	12
Arizona	1	1
California	9	35
Colorado	29	49
Dakota	3	25
Idaho	5	8
Michigan	7	13
Missouri	2	6
Montana	13	45
Nevada	7	21
New Mexico	2	2
Utah	5	31
Totals	75	248
Total for 1888	68	255
Total for 1887	65	214
Total for 1886	58	203
Total for 1885	53	208
Total for 1884	64	230
Total for 1883	66	234
Total for 1882	64	331
Total for 1881	60	312

There was a falling off of \$1,300,000 in these dividends, last year, as compared with 1888. With this exception, the total is the largest since 1882 and is about 50 per cent larger than in 1885. The Michigan copper mines are responsible for over \$800,000 of the decrease last year, the Nevada mines for \$334,000 and the California mines for \$315,000. The Colorado mines added \$544,000 to the record for 1889, and the Utah mines \$102,000 above 1888.

CALIFORNIA.

With the mining industries of California the past has been a fairly good year, the hullion product of the State having come up to the recent average. That it would have been considerably larger but for the extreme drouth at one time, and the excess of water at another, we have reason to believe. Owing to a rather light snowfall on the mountains the preceding winter, followed by an early cessation of the spring rains, there ensued a general shortage of water before the summer was over, the drouth continuing until the autumn was more than half gone. As a consequence the active season of the gravel miners was much restricted, while the quartz-mills, dependent on water for their propulsive power, lost each from two to three months time, the only parties advantaged by the drouth being the river-bed miners, who, owing to the low stage of water, were enabled to commence operations much earlier than usual.

It might be thought that the early advent of the fall rains, followed by a heavy winter precipitation, would have compensated at least in part for the evils attendant on the drouth. But it did not so turn out. On the contrary, these heavy and protracted rains brought with them their own disadvantages and drawbacks. The floods developed, in fact, a crop of mischief less tolerable than that bred of the drouth. The prosperous working season of the river-bed miners was brought to a premature end, their claims being suddenly filled with debris and their plants swept away. The ditches, filled to repletion, were broken, their flow being so impeded with ice and snow that they could no longer supply the quartz-mills with water, forcing many of these once more to a standstill. The water making its way into the underground workings of the vein mines, ore extraction was in many instances greatly impeded or stopped altogether. The roads meantime became so bad that hauling was next to impossible. As a result, many of the mills were left short of ore, some also of fuel and other supplies; from all which it will be seen that gold mining in California, though an exceptionally safe business, is nevertheless subject to some of the vicissitudes and uncertainties incident to farming, fruit-growing and most other pursuits.

At the present writing the situation, as above described, remains little changed. The rain, which commenced falling about the middle of October, has since continued with so little interruption that it may be considered a prolonged storm. The intervals of fair weather since vouchsafed us have been short and few, amounting to much less than a month altogether. The streams are everywhere running hankfull, many of them overflowing their banks. The wagon-roads continue nearly impassable, those in the mountains owing to the unprecedented depth of the snow, those at the lower levels owing to the death of the mud.

The railroads in the Sierra Nevada and in the Siskiyou ranges are badly demoralized, portions of them being likely to so remain for some time. This has rendered transportation to and from

many of the mining camps difficult and costly.

The causes which have so interfered with vein mining have in many localities proved equally detrimental to placer operations. The hydraulic miners have as yet been able to do very little. The drifters have not, of course, suffered much from the excess of water, while to the ground-sloppers and others, who depend on free water and plenty of it for their success, it has proved a very godsend, these men having everywhere below the heavy snow belt been driving an active and thrifty business the whole winter through.

General Progress and Improvement Made.

While the past year has not been marked by any notable events in the mining world or seen the field of active operations much extended, it has, at the same time, brought with it a fair amount of improvement of one kind and another. The introduction of the electric motor has made encouraging headway. The practice of ore concentration has become more common, it having been adopted by many companies during the year and generally with gratifying results. Water has in numerous instances been substituted for steam-power or made to supplement the latter. The year has been prolific of inventions designed to cheapen or perfect mining implements, mechanisms and processes, many patents for securing these improvements having meantime been taken out. Great gains steadily inure to the mining industry through the introduction of these various devices. The tendency, as for some time past, is still toward the working of lower grade ores, what has been accomplished in this direction having been largely due to the various improvements above mentioned.

As to the work performed of late by the State Mining Bureau, this institution has been brought into a condition of great proficiency and usefulness. The year seems to have awakened among our miners something of the ancient spirit of exploration, starting many of them out on prospecting expeditions in the mountains. Mining in several of the old and partially deserted districts has also undergone some revival, causing there a slight increase in the hullion output and population. Aggregated, the improvements above mentioned denote no small amount of gains effected during the past year.

Of all our several branches of gold-mining, none have been so well prospered of late as

Drift Operations.

These never being exposed to suffer much from either an excess or lack of water. As the precipitation ever so great, it cannot much impede this class of operations, while the miner rarely ever finds himself left without water enough to wash the gravel extracted during the year. Since the partial closing of the hydraulic mines, increased attention has been turned to this branch of the business, imparting to it an activity that it would not have otherwise experienced. The tier of counties extending from El Dorado to Plumas continues the site of the larger drift operations, not much being done in this line outside of these. While the old mines here have kept up and in some instances increased their usual output, a good deal of new drift ground along this belt has within the past 12 months been opened, it being the intention of some of these recently-formed companies to engage in this business on a very extensive scale.

Hydraulic Mining.

While gravel-washing by the hydraulic method has been effectually suppressed in the more central mining counties, formerly its largest field, it still goes on uninterrupted in the northwesterly part of the State, Trinity and Siskiyou constituting now our leading hydraulic counties. In ordinary winters this style of gravel-washing is not apt to suffer much interruption by reason of snow, ice or floods. These have, however, the present winter proved to the business a serious detriment, the snow having in many localities reached a depth that not only interfered with piling, but precluded it altogether. With the warmer weather now at hand, most of the companies will be able to get to work, the prospect being that the incoming season will prove to this class of miners a very prosperous one, as the water supply promises to be larger than ever before. While the working season of

The River-Bed Miners

Terminated in the premature and abrupt manner mentioned, their earnings last year came fully up to the average, as they got to work much earlier than usual. While this method of gold-gathering is practiced along most of the larger streams in the mining regions of California, the basiest operations are carried on in the heads of the Scott, Klamath and Salmon rivers, in Siskiyou county. Although subject to many contingencies, this branch of mining pays well, and sometimes very largely when the conditions prove favorable. It can hardly be called a growing industry, large sections of the river-beds being already worked out and it requiring many years for these to become sufficiently enriched to warrant their being worked over again, this process of restoration being especially slow in districts where the hydraulic mines have been closed down.

Quartz Mining.

The mining of gold quartz in California still continues to be that branch which produces the

most gold. Of late years much more attention has been paid to the economies of vein mining, with good results. It is now possible to work ores of lower grade than could be touched at all ten years ago. The era of big salaries, "top-heavy" companies and extravagance has passed by, and in its stead is one of hard work, economy and business principles.

While there have been many minor inventions in the line of saving gold from quartz, there have been no very radical changes of late. There has been a tendency to adopt the rotary or roller-mills at smaller mines instead of stamps, mainly because these appliances in their various forms are less expensive than the stamps, and they answer their purpose very well indeed.

As we have each week reported progress from the various districts of the State, it is unnecessary to review their operations in any detail. The region around Grass Valley, Nevada county, continues to keep the lead in quartz operations. More attention has been paid to quartz recently in the northern counties, particularly in Shasta, where some large operations are being conducted.

Many old mines have within the past year or two been reopened and reworked. There are still many hundreds which were operated at a time when we knew less than we do now about gold-quartz mining, and which would pay now. Gradually these mines will be reopened and do their share toward increasing the hullion product. In fact, quartz-mining is in as good condition to-day in California as it ever was, and is a paying industry.

Quicksilver.

There is one mineral product yielded by California not made elsewhere in the United States, and that is quicksilver, though the State is not credited with this on the hullion product tables. Last year the value of this California quicksilver was \$1,544,000. Through the courtesy of Mr. J. B. Randol, of the New Almaden mine, we are enabled to give the following facts concerning our quicksilver industry.

The following table shows the production of the several mines for two years past:

Mines.	1888.	1889.
New Almaden	18,000	13,100
Elm	950	950
Napa Consolidated	4,005	4,500
Great Western	625	550
Sulphur Bank	2,164	2,150
New Idria	1,320	1,000
Great Eastern	1,151	1,350
Redington	125	800
Bradford Consolidated	3,545	1,700
Various	902	500
Total flasks	33,250	25,650*
Lowest price per flask	\$37 00	\$40 00
Highest price per flask	48 00	50 00
Average per flask	42 60	45 00

Total value at average price.....\$1,415,000 \$1,154,000.

*The total production for 1889 is a near approximation.

The monthly production and highest and lowest prices prevailing during the past year have been as follows:

Month.	Monthly production.	Highest price per flask.	Lowest price per flask.
January	2,270	\$43 00	\$41 50
February	1,740	42 00	41 50
March	2,125	41 50	40 00
April	2,134	41 00	40 00
May	1,340	45 00	41 00

November	2,460	48 00	46 00
December	2,305*	48 00	47 00

*December product estimated.

The total production for 1889, 25,650 flasks, compared with the previous year, shows a decrease of 7600 flasks, and is the smallest quantity in any year since 1873, when the production was 27,642 flasks.

New Almaden's production shows a loss of 4900 flasks and is its lowest yield since 1874, when its production was 9034 flasks.

Napa Consolidated retains its position of second highest producer and increased its output to 4500 flasks, a gain of 435 flasks.

Elm was dropped off the list. Bradford, the third in rank last year, produced only 1700 flasks, a loss of 2145 flasks. Great Western produced 550 flasks, a loss of 75 flasks. Sulphur Bank also shows a slight decrease, 2150 against 2164. New Idria had a like misfortune, 1000 against 1320.

Great Eastern, an unimportant increase, 1350 against 1320. Redington, in a last expiring effort, turned out 800 against 125, and various odds and ends of mines gathered 500 against 902 in 1888.

This decrease all along the line (except Napa Consolidated) emphasizes the poverty of the mines; the higher price of quicksilver has failed to arrest the decline in production and the future outlook is far from hopeful.

Still higher prices must prevail in 1890; and this industry must be protected by a liberal duty—at least ten cents per pound—otherwise we may look for a further decline in production, to a point where the output will be insufficient to pay costs; and then—extinction.

The Oil Industry.

Mr. Louis Blankenhorn has written for the Los Angeles Express an account of the growth of the oil industry in Southern California, from which we make the following extracts:

The history of the oil development of California dates substantially from 1862. Companies were formed, machinery purchased and much

money spent, only to show that Southern California presented, as yet, the only field where petroleum could be sought in merchantable quantities, and even here was destined to wait many years for the realization of success. Some oil was sought and found in Los Angeles and Ventura counties, but the year 1875, or about, brought railroad facilities, markets, men and material, and had accumulated experience which gave a new impetus to the quest for the oil which, there was no doubt, existed, according to all geological and practical expert opinion, beneath our upturned and distorted surface strata. The Pico canyon field was then opened, and has seen some 40 wells drilled since, most of which have produced a fine oil and whose production has aggregated many hundred thousands of barrels and added millions of wealth to our State and county. This oil has been used chiefly for reneig oil on naphtha, lubricating and gas oils. This field continues to produce largely and drilling goes on. The companies formerly owning the oil-field now merged into the Pacific Coast Oil Company, formerly operated the refinery at Newhall, but now find it more convenient to transport the crude to the great oil refinery at Alameda Point.

The Puente oil-fields of Los Angeles county are about 30 miles from Los Angeles and five miles from the Southern Pacific railroad, to which the oil is transported by a pipeline. The development dates from previous to 1882. The Puente Co. have drilled 13 wells, and the production has aggregated about 3000 barrels per month for some time past. The Puente Company market their oil in this city, and have aided materially in the support of our industries, and the wells have no doubt proven a very profitable investment to the fortunate owners, Messrs. Lacy & Rowland. During 15 years past a score or more of other wells have been drilled for oil within a radius of 25 miles around Los Angeles in all directions, some of which are producing small quantities of oil, but most of which, while passing through oil-bearing strata, failed to produce in profitable quantity, or have met with difficulties that have caused abandonment of the wells. Some gas has also been found. All signs point to the hope and faith that oil and gas will be found in large quantities in Los Angeles county, when accumulated nerve and capital shall seek it at sufficient depths.

By far the largest producing territory, however, in California is that now developed and controlled by the Hardison & Stewart Co., the Seape Oil Co., and the Mission Transfer Co., in Ventura county.

The companies referred to are substantially one interest, and the magnitude of their operations indicates the value of the business to Southern California, and leads to the reasonable expectation of cheap and abundant fuel for all new and present manufacturing industries and other purposes where fuel enters as a factor in the problem.

The managing head of the companies is W. L. Hardison of Santa Paula. With him are associated in the directory Lyman Stewart and Dan McFarland of Los Angeles, Hon. Thomas R. Bard of Hueneme and others.

The purchase or lease of the many thousands of acres of oil territory controlled by them; the drilling of over 70 wells; the laying of over 125 miles of pipe lines, connecting the wells with railroad and seaboard shipping facilities, and other properties and plant, now represent an investment in cash of over three-quarters of a million of dollars. Its tankage represents a storage capacity of nearly 100,000 barrels, and 52 tank-cars of large capacity are in use to transport its products to market. The territory covered by these companies reaches from the eastern edge of Ventura county to the San Buenaventura river. The various fields are known as Torrey Canyon, Seape, Santa Paula, Adams, Wheeler and Aliso Canyons and the Ojai Valley. Five sets of tools are kept drilling new wells constantly, and many new wells are finished each year. Besides the work of these companies, however, there are a number of other corporate or individual operators who are now drilling and exploiting in the same territory, and with the vast fields and markets open and ready to absorb a large increase in production of fuel petroleum, there can be no monopoly of production for a long time to come. The Mission Transfer Co. has within a year finished a large refinery at Santa Paula, equipped with the latest and most improved facilities for refining oil, and has a present capacity of distilling daily 300 barrels of crude, which can easily be doubled when necessary. Its products are now illuminating and lubricating oils of fine quality, naphtha (gasoline) and asphaltum, all of which find a market at hand.

ARIZONA.

Arizona has a very large extent of mineral ground yet undeveloped; in fact there are large tracts still unprospected. The territory has not been as fortunate as other regions in obtaining the aid of capital for its mines. Reduction works are needed in many places and money is wanted to open and outfit mines. Therefore mining affairs have not made the advancement proportionate to the worth of the properties. We have from week to week chronicled the progress of the mines in the various camps, and elsewhere in this issue of the PRESS give the estimate of the past year's hullion product of the Territory. What was the principal camp of the Territory is not prosperous just

now, as Tombstone, like other places, needs outside capital to aid it.

Arizona ranks second to Montana among the Pacific States and Territories in copper production. The *Engineering and Mining Journal* gives the copper production of Arizona for the year 1889 at 31,600,000 pounds, divided among the several companies as follows:

Copper Queen Co.	9,024,000
Arizona Copper Co.	7,600,000
Old Dominion Co.	6,009,230
Detroit Co.	2,385,000
Holbrook and Cave Co.	2,100,000
United Verde Co.	438,780
Other mines	438,780

The *Globe Silver Belt* says: The estimate of the Old Dominion Co.'s production is slightly excessive, and the figures for other mines may not be exactly correct, but approximately they are right and show a very prosperous year for the copper industry of our Territory. While the Old Dominion Copper Co. of Globe ranks third in production, yet its profits for the year are probably larger than any other Arizona company can show, as was the case for the previous year. Despite the difficulty and great expense of getting coke and supplies, and shipping copper, by reason of remoteness from railroads, it has been proven that the Globe mine can produce copper cheaper than any other mine in the Territory, and there is no doubt but that it is to-day the most valuable copper property in Arizona.

A correspondent of the *Lordsburg Liberal* has this to say concerning the Olfitt district: This camp from the following showing, per shipment for this year, 1889, modestly asks if it is not entitled to be dubbed as a producer without a peer in the territory. To wit: Arizona copper company, copper bullion, 7,253,855 pounds. The Detroit copper company, 5,041,820 pounds; copper ores shipped, 523,450 pounds. Silver and gold ores, 50,940 pounds. From this showing is it any wonder that foreign capital has fastened itself so permanently? American capitalists it would seem from this have not the brain to direct nor the grit to inspire it to a healthy and safe investment. The mineral lands hereabout are slowly, surely and cheaply being bought up by the shrewd, far-seeing Scotchman. The American, an intelligent prospector, after failing to induce his own kind who have capital, to take hold, has been forced to yield to the inevitable and sell his discovery and labor for a mere mess of beans. Copper can be safely quoted on an average for the year 1889 at 10 cents per pound. At that market price the bullion alone shipped from here would yield \$1,229,567.50. It is also safe to say that \$40,000 per month, in connection with the above-order system that prevails, would cover every item of expense; if that amount did not do it is a sure thing that \$50,000 would, and would leave the profit of \$629,577.50 for the copper production alone. The figures as given above are correct, and it does seem with our hoisted idle capital a few, at least, Americans would see the point.

The mining interests have been unusually active during the year, says the *Prescott Journal-Miner*. A greater number of sales have been consummated, and a larger amount expended in development work and improvements in the way of building mills, etc., than during any previous year in the history of the country. Of the more important sales that have been made during the year, to say nothing of the numerous transfers of small claims, may be mentioned the Dixie group on Lynx creek, the Mockingbird on Cherry creek, the Dan O'Boyle mine on the Hassayampa, the Silver King and adjoining group on Groom creek, the Black Horse on the Hassayampa, the Ryland mine at Minnehaha, the Del Pasco group of mines in the Bradshaw mountains, the Senator mine on the Hassayampa, the Boggs and Hackberry on Big Bug, and the Harrison mine at Placerville.

The year has also witnessed the building of a mill at the Congress mine at a cost of \$60,000, together with other improvements costing fully \$40,000 more; the Dixie mill costing \$20,000; the Quartz Mountain mill costing the same; the Wire Gold mill costing \$10,000; and the Cherry Creek mill costing from \$10,000 to \$20,000, and from \$5,000 to \$10,000 spent in putting the Eltsa mill in repair. The Oro Bella, Crowned King and Ryland mills, although built in 1888, were not started until the early part of 1889, and have all proven successful and are now ranged among the paying enterprises of the country. The Copper Basin smelter is also among the enterprises started up during 1889, while the United Verde smelter, started some four or five years ago, has just added another year to its successful operation.

For the year will reach very close to \$1,500,000, or an increase of about one-half over that of 1888. The largest producers for 1889 have been the same as during 1888—the Congress and Hillside, the former having more than doubled its product for 1888. It is now, since starting the mill, producing in ore and concentrates over \$40,000 per month, or on a yearly basis of \$500,000. The producing power of the mine is capable of even doubling this product, with increased facilities for working and shipping it.

The new service dam of the Walnut Grove Water-Storage Company on the Hassayampa, constructed during the year at an expense of upward of \$100,000, has also been among the additions made to the facilities for producing precious metals. This is intended to furnish water to gold-bearing gravel-beds along the creek some miles below, and will be in operation early in the year 1890.

COLORADO.

We have given elsewhere the estimate of Wells, Fargo & Co. concerning the bullion product of Colorado. The *Denver Republican*, however, puts it at \$29,935,477, and says the information is from the smelters, ore-buyers and mint. The amount obtained from each source was as follows:

From smelters	\$28,000,445
Shipped out of the State	750,000
Deposited in the mint	1,185,032
Total	\$29,935,477

The *Republican* says: This is not, however, all of the production. Some gold was sent out of the State not appearing in the figures given by those quoted, and some was sold to manfacturers. The amounts so disposed of aggregate more than is usually supposed, but as any estimate would be only a guess, it is omitted from the calculation. It will certainly be enough to swell the figures given to over \$30,000,000. This is fully \$2,000,000 more than has been produced during any previous year.

The silver is calculated at 93 cents per ounce. The United States authorities, in their estimates, calculate silver at its coinage value of \$1.29 per ounce, thus making each year the value of the production more than the miner or ore-buyer or smelter received for it. As an illustration, the value of Colorado's product for 1888 was reported by the director of the mint to be \$36,000,000, which was fully \$8,000,000 above its commercial value.

Production has been curtailed considerably by the low prices of lead and silver. The same fact is true of the production of the last three years, but as prices ruled lower last year than ever before, the effect was felt more seriously, and production probably curtailed more than ever. The Henrietta and Maid, at Leadville, the heaviest tonnage-producer in the State, whose ore is an argentiferous lead ore, turned out as little as possible to keep running during the most of the year, and closed down entirely in November. The two heaviest producers at Aspen also closed down for December, owing to unsatisfactory prices. Ordinarily these things would have militated against even an average production, but their effect was more than offset by the increase from other sources.

New discoveries have added their quota to the total yield, but the amount derived from them has not been sufficient to swell the product as much as it has been expected. The additions are due to increased activity in the older mines, and all parts of the State share the honor. The San Juan country has added about one-sixth to its product, a fair part of which came from the new discoveries in the gold belt at Ouray. Next to that region the counties of Clear Creek and Gilpin show the largest proportionate gain. It is peculiarly gratifying to the miner who has faith in his occupation that the oldest mining region in the State, where the first discoveries were made and where mining has been continuously conducted for 30 years, should show the largest proportionate increase in the past year.

Both Lode and Placer Mining.

The prosperity has affected both lode and placer mining, though the latter was less than it would have been had water not been scarce. More placers were operated last year than ever before, and results were favorable. Especially was this the case on the San Miguel, where the Keystone, San Miguel and U. S. gold placers were operated, the yield having varied from 25 cents to \$1 per cubic yard.

All indications point to an increase during the present year fully as great as that which characterized last. It seems as though the march was onward, and that mining in Colorado is but in its infancy.

Product of the Various Smelters.

The production of the different smelting establishments in the State, in detail, was as follows:

GLOBE SMELTING AND REFINING CO.	
3,319,547 ounces silver	\$3,153,570 41
15,792 57 ounces gold	315,851 40
19,637,815 pounds lead	765,874 79
329,502 pounds copper	46,150 68
Total	\$4,235,472 28

As compared with 1888:

Increase in copper, pounds	274,898
Increase in silver, ounces	871,007
Increase in lead, ounces	18,013 02
Increase in gold, ounces	5,854,467
Prices 1888.	
Copper	15c per lb.
Lead	\$4.40 per cwt.
Silver	93c per oz.
Gold	\$20.67 per oz.
Prices 1889.	
Copper	12c per lb.
Lead	\$3.80 per cwt.
Silver	93c per oz.
Gold	\$20.67 per oz.

Average monthly pay-roll, \$33,500; number of men employed, 550.

The total tons of ore, lime rock, charcoal and coal consumed during the year was 235,230.

The Leadville *Herald-Democrat* in speaking of the camp of Leadville says: The bullion product of the Leadville smelters during 1889 amounts to \$8,299,854 65; the total amount of ore shipped to the valley smelters during 1889 amounts to \$5,384,197 10; the total making the entire output from the Leadville district for the year past \$13,684,051 75. This is an increase of \$1,552,845 27 over that of 1888.

The total production of the camp from 1860 to 1890 amounts to \$153,405,195.

Our calculations of the output for 1889 from all sources have been made with great care, and special pains were taken to avoid the slightest exaggeration of reports received. The result reached, \$13,684,051, will go to the world as the performance of our mines in the twelfth year

since their discovery, and those who are most familiar with the sources of our information will agree that our figures are under rather than above the actual. We have chosen to omit altogether the production of our chief gold property—the Antioch—since the actual returns could not be obtained from the management, and it is more than probable that this and other omissions of mine yields, not readily obtainable, would, if added to our aggregate, swell the grand total to \$14,000,000. Only in four years since 1878 has the production of the district reached this figure—1880, 1882, 1883 and 1886—when we received very much higher prices for both silver and lead. Indeed, had values been equal to those of 1882 the output of the year just closed would exceed that of any year since mineral was discovered here. As it is, the total production exceeds that of 1879, the year of the boom, by \$3,350,351. It exceeds that of 1881 by \$536,594; it exceeds that of 1885 by \$1,326,784; it exceeds that of 1887 by \$1,611,084; it exceeds that of 1888 by \$1,854,241; it is exceeded by that of 1880 by \$1,341,078; it is exceeded by that of 1882 by \$3,443,351; it is exceeded by that of 1883 by \$1,854,395, and by that of 1886 by \$66,782, an excess so small that the product of the Antioch, if added, would more than overcome it. The output of 1889 exceeds the average output of 11 years by \$256,301.

The total output of the Leadville district now aggregates \$153,405,155.

Leadville's Smelters.

This continuous action on the part of the smelters has resulted in the treating of a much greater amount of ore than during the previous year, and the consequent production of a great deal more bullion, containing a great deal more silver and lead than during that length of time—the Arkansas Valley Smelting Company coming to the front with some 9300 tons of bullion, carrying over 2,200,000 ounces of silver and over 5500 ounces of gold, in addition to which this smelter produced from its matte 140 tons of bullion with nearly 115,000 more ounces of silver and some little gold.

The American Smelting Co. produced over 10,500 tons of bullion, over 2,000,000 ounces of silver, 21,000,000 pounds of lead, and over 2500 ounces of gold; while the Hanson Reduction Works sent out nearly 4500 tons of bullion, over 1,000,000 ounces of silver and 5000 ounces of gold.

The Manville, with its three stacks, did very well indeed, and kept up its reputation for close smelting by the production of some 5,500,000 pounds of lead, over 500,000 ounces of silver, and about 1800 ounces of gold, each and every one of the smelters greatly exceeding their product for the previous year.

In the early part of 1889 a company called the Colorado Gold, Silver and Lead Recovery Co. went to work with a process of their own on the slag dumps of the La Plata smelter, and for a very short time succeeded fairly well, making a matte which netted them about \$60 per ton, but very shortly for some reason gave up the attempt.

The roasting furnaces of the Arkansas Valley smelter have a capacity of about 60 tons of sulphide ore per day, and have proven a valuable aid to the smelting of some of the more refractory ores of the camp, and the number of such furnaces will undoubtedly be added to ere long.

The Harrison Reduction Works, not having these furnaces, devotes its attention principally to the lead carbonate and dry silicious ores.

The concentrating mills have all been running full time for the greater part of the year.

During the year 1888 there were shipped from Aspen 90,170 tons of ore of an estimated value of \$5,229,860. The value per ton was figured at \$58, but there has been reason to believe that the figure was too low, and it would probably be fair to put the value of the output of the year 1889 at a considerably higher figure.

The product during 1889 amounted to 120,560 tons, which, at an average value of \$60 per ton, would make the gross output of the camp \$7,233,600, an increase of more than \$2,000,000 over the year before.

The problem of getting at the exact value of the product is complicated by reason of the fact that all the ore is shipped to outside smelters and through many channels. The samplers handle part of it, but much is shipped direct. Some mine-owners object to giving their products, and others only keep a record of net values. The minimum value of pay ore in the district is about \$30 per ton, and the product varies all the way from that figure to several hundred, some shipments going into the thousands. It is safe to calculate that the average value will not fall below \$60, while it might go as high as \$65, or even higher.

There have been some shipments of very high-grade mineral during the year, but the returns from such are never made public, and information concerning them is extremely indefinite. While the minimum value can be quite definitely known, the other end of the scale is always an uncertain quantity.

The suspension of shipments from the Aspen and Compromise mines, during the months of November and December, reduced the year's yield about 10,000 tons, otherwise the product would have passed beyond the \$5,000,000 mark.

The greatest need that Aspen experiences is a market for her low-grade ores. If there were works in the valley that could handle ore run-

ning as low as 15 ounces or 20 ounces, the tonnage of the camp would soon be more than doubled. The present year promises to be highly prosperous because of the many new discoveries of high-grade mineral, but if it should also bring to the district the needed facilities for working the poorer classes of ore, general business would soon be doubled, and mining development would be still further stimulated.

Colorado is rich in both iron and coal. The coal production in 1889 was 2,500,000 tons. The average price paid to miners throughout the State is 71 cents per ton of 2000 pounds for mining and timbering their workings. The area of coal-bearing sections in the State is now said to exceed, somewhat, 26,000,000 acres. The coke production for last year, from Crested Butte and El Moro ovens, was 116,500. There are also about 25 petroleum wells in the State, which are yielding about 1300 barrels per day.

It is impossible in the space at our disposal to give any consideration to the developments or prospects of individual mines in Colorado, and we must content ourselves with the brief summary of results presented.

IDAHO.

Idaho has come to the front the past year and wrested the third place among the bullion-producing from California, taking her position mainly by reason of the value of some millions of lead. The importation of cheap lead ores, however, acted to the detriment of Idaho, and the fire at Wood River was bad for the mining industry of that region. The Wood River country, however, has much that is encouraging in its mines, some of which are shipping ore and others being developed. At Bellevue the Minnie Moore and Queen of the Hills are both shipping. At Yankee Fork the Dickens-Caster property lay idle part of the time last year, though when running the bullion product was \$30,000 a month. The Washington ran its small mill all the year. The Rams-horn Co. operated its plant at Bay Horse only part of the year. The mines are in excellent condition, as is all the plant, consisting of a concentrating mill and smelter. The machinery is operated by water under 375 feet pressure on a Pelton wheel. During the season the company shipped about 405 tons of bullion, carrying 206 354 ounces silver, 200 tons of speiss and matte, carrying 12,000 ounces silver and about 250 tons of high-grade ore carrying about 50,000 ounces silver. To make this bullion, matte and speiss required 195,000 bushels of charcoal, made in permanent kilns near the smelter. The shipments of these smaller mines aggregate about 150 tons, equal to about 30,000 ounces of silver, making the product of the camp, outside of the mines owned by the Clayton Co., aggregate nearly if not quite 300,000 ounces silver.

In Sea Foam district considerable progress has been made, though the distance from an ore market has hindered development. At Nicholia, the Viola Co. ran their works three months and turned out 1500 tons of bullion. Rocky Bar mines are being developed and a number of small mines keep the custom mill at work. The principal mining camps in and around Silver City did well with several mills running. Silver City shipped away \$265,000 last year. The De Lamar group at Wagon-town turned out \$410,000 in 1889.

The U. S. Assay Office at Boise City handled last year \$622,773 in gold and \$70,924 in silver.

Mr. J. W. Canningham, assayer in charge, in transmitting this table of gold and silver, says: "The placer mines of Idaho have yielded scarcely half the product of a good season, owing to the lack of sufficient water to work them. Many of the largest claims were not worked at all. You are thoroughly acquainted with these conditions, however, and will be able to see under what disadvantages so good a showing has been made."

"Deposits during the last few months came from Portland, Baker City, Pendleton, Canyon City and Malheur, Oregon, and from Lewiston, Salmon City and other distant points in Idaho, besides the many places in the vicinity of the office. This shows how large a section is accommodated by this office. The Government maintains the office at considerable expense, simply for the convenience of the miners. Exactly the same value is received for bullion deposited here as at the mint at Philadelphia or San Francisco, the depositor getting quicker returns and saving a great deal in the difference in express charges."

The Cœur d'Alene mines have done well the past year. The *Wardner News* says: "Vast as have been the achievements of the past, they are as nothing compared with the possibilities of the future, of which the most vivid imagination can scarcely yet conceive. The healthy condition of affairs and approaching tide of development warrants the expectation of a marked enhancement of values. Although our country has but passed the first stages of its existence, it already occupies an important place in the history of mining, if great achievements count for aught. Gradually the silly prejudice of over-timid capitalists, which has too long handicapped the industry of mining, is disappearing, and the grand opportunities for the profitable investment of capital are being realized. Miles upon miles of mineral lands are found in Northern Idaho, and our country is blessed with a bustling, ambitious, intelligent community, who are straining every nerve toward its development. The workings of our

mines are yielding rich returns that are dropping rapidly into the big financial basket, causing all eyes to turn in admiration to the wealth of Cœur d'Alene."

MONTANA.

Montana still stands at the head of the bullion-producing regions of the United States, having made a splendid record last year, as for several years past. Butte is now the most important mining "camp" in the country, having long since eclipsed Leadville and Virginia, and is apt to keep this position for some years to come.

Some idea of the immense amount of ore treated in Montana may be gained by a glance at the reduction works in various parts of the State. Those of Butte and Anaconda consist of mills, smelters and concentrators. In Butte the following quartz-mills are in operation: Blue Bird, 90 stamps; Lexington, 50 stamps; Alio, 80 stamps; Moulton, 40 stamps; Silver Bow, 50 stamps. At Anaconda there is a 60-stamp wet-crushing mill. Total number of stamps operating on Butte ore, 350. These stamps together crush an average of 600 tons of ore per day, or 18,000 tons per month, or 216,000 tons per annum. The great bulk of Butte ore, however, is treated in the great smelters designated as follows:

	Daily capacity, tons.
Butte & Montana	1,000
Parrot	400
Butte & Boston	100
Colorado & Montana	100
Butte Reduction Works	150
Anaconda (limited account of fire)	1,500

The Boston & Montana's new smelter at Great Falls, when completed, will treat not less than 2000 tons per day, and the Butte & Boston's new smelter, when completed, 1000 tons per day. Together they will equal the Anaconda's full blast capacity of 3000 tons. The total ore output of the Butte mines will be as follows:

Number of smelters on Butte ore	8
Capacity for the year 1889	3,250 tons
Capacity for the year 1890	6,750 tons

In addition to the great mills and smelters of Butte, there are many others located in various portions of the State and contributing liberally to its mighty output. Among the mills, the principal ones are the Granite (2), Hope, Black Pine, Cable Pyreneas, Bimetallic and Champion in Deer Lodge county; Drumlunnon (3 mills, 120 stamps), Jay Gould, Empire, Gloster and Sterling in Lewis and Clarke; Elkhorn in Jefferson; and five gold-mills in Madison and others in Beaverhead, Meagher and Missoula. There are no fewer than 900 stamps in operation in the State, other than those of Butte, numbering 350 and making a grand total of 1250 stamps pounding out silver and gold. Without knowing exactly, it is fair to assume that these stamps treat not less than 2000 tons of ore every 24 hours.

The smelting plants outside of Butte and Anaconda are few, though many are projected. The largest in operation are the Hecla Con. at Glendale, one of the best managed and most profitable institutions in the country; the Helena Mining and Reduction Company's works, near Helena, and the Great Falls smelter at the city of that name. The total capacity of these is 1500 tons per day.

From these figures an intelligent idea can be obtained concerning the amount of ore treated daily in this State. It may be more plainly set forth as follows:

Ore treated in Butte silver mills	500
Ore treated in Butte and Anaconda smelters	3,500
Ore treated in other silver mills	1,500
Ore treated in other smelters	1,500
Total	7,000

It is impossible in the space at command to even mention any except the most prominent properties. The Butte *Inter-Mountain* in its holiday "souvenir," which is very handsomely printed, gives a vast amount of information concerning the mines, but we can only make room for a few extracts.

The basis of the present great commercial prosperity of Butte rests very largely upon the number of men employed by the mining and reduction companies and the amount of wages paid out. Each year shows a great increase in the sum of money thus distributed, for the list of employees is constantly growing while the scale of wages remains the same. The following table will be of interest to those who would understand the prosperity of Butte:

Company.	Men Employed.	Monthly Pay Roll.
Anaconda (Smelter included)	500	\$300,000
Butte & Montana	300	30,000
Parrot	400	40,000
Butte & Boston	300	30,000
Blue Bird	250	25,000
Colorado	300	30,000
Butte Reduction Works	100	10,000
Lexington	250	25,000
Moulton	200	20,000
Alio	75	7,500
Cora, Wabash, Volunteer, Stevens, Ramsdell, Parrot, Star West, Clear Grit, etc.	500	50,000
	8,175	617,500

The Blue Bird produces from \$1,250,000 to \$1,600,000 a year, and the Anaconda makes yearly profits of \$5,000,000. It never has declared a public dividend.

Below appears a table of the production of the mills and smelters of Butte for the year 1889, based upon official or other reliable information. In the totals, copper is figured at 11 cents and silver at 93—about the average value of those metals during the year. The silver

bullion is figured at 800 fine. The 20-stamp mill of the Alio has been long undergoing repairs, and the great Blue Bird has been closed for nearly four months, thus accounting for the small reduction in the bullion shipments as compared with last year. The copper shipments show a great increase, as do also the silver contents of the copper matte. Had copper sold for as much in 1889 as it brought in 1888, the product of the district would show a total value of \$26,801,887.35, the depreciation in the price of copper having cost the district \$4,796,000. But the showing with copper at 11 cents is magnificent and healthy. The tabulated production is as follows:

BOSTON & MONTANA COMPANY.	
Silver, 283,107 ozs. at 93c.	\$244,689 61
Copper, 20,000,000 lbs. at 11c.	2,200,000 00
Gold, 000 ozs. at \$20	13,320 00
	\$3,118,009 61

PARROT COMPANY.	
Silver, 800,000 ozs. at 93c.	\$744,000 00
Copper, 12,000,000 lbs. at 11c	1,320,000 00
	\$8,064,000 00

ANACONDA COMPANY.	
Copper, 70,000,000 lbs. at 11c, exclusive of silver in matte	\$7,700,000 00
Bullion silver, 2,000,000 ozs. at 93c.	1,860,000 00
	\$9,560,000 00

BUTTE & BOSTON COMPANY.	
Copper, 2,500,000 lbs. at 11c.	\$275,000 00
	\$275,000 00

SILVER BOW MILL PRODUCT INCLUDED IN EXPRESS SHIPMENTS.	
	\$275,000 00

COLORADO COMPANY.	
Silver, 840,000 ozs. at 93c.	\$781,200 01
Copper, 2,400,000 lbs. at 11c.	264,000 00
Gold, 1500 ozs. at \$20	30,000 00
	\$1,051,200 00

BUTTE REDUCTION WORKS.	
Silver, 4,000,000 ozs. at 93c.	\$396,000 00
Copper, 7,000,000 lbs. at 11c.	770,000 00
	\$1,130,000 00

HORN BROOK SAMPLER.	
Silver, gold and copper value of shipments	\$560,000 00
	\$560,000 00

MISCELLANEOUS SHIPMENTS.	
Placers and small mills	\$350,000 00
	\$350,000 00

The silver bullion shipped by Wells-Fargo, American and Pacific Express Companies from the Alio, Bluebird, Moulton, Lexington and Silver Bow (Butte & Boston) mills aggregate 3274 bars, 259,913 ozs. in weight. The above bars contained on a basis of 800 fine 4,158,038 ounces of fine silver, which at the average market value of 93 cents per ounce amount to

Grand total	\$22,005,689 35
-------------	-----------------

The total amount of dividends paid by the incorporated mining companies of Montana makes an interesting and important table. During the past ten years the dividends paid by those companies only whose stock is listed have aggregated as follows:

Mine.	County.	Amount.
Alio	Silver Bow	\$800,000
Amy & Silversmith	Silver Bow	334,520
Boston & Montana	Silver Bow	925,000
Butte & Montana (gold)	Lewis & Clarke	520,000
Elkhorn	Jefferson	150,000
Empire	Lewis & Clarke	70,500
Granite Mountain	Deer Lodge	7,600,000
Helena Mining & Red'n	Lewis & Clarke	192,310
Hecla Con.	Beaverhead	1,375,500
Hope	Deer Lodge	233,000
Jay Gould	Lewis & Clarke	375,000
Drumlunnon	Lewis & Clarke	2,417,000
Moulton	Silver Bow	350,000
Original	Silver Bow	183,000
Parrot	Lexington	1,045,000
\$565,000	Silver Bow	1,045,000
Total		\$16,455,830

During the year the declared dividends of the companies above mentioned amounted to something over \$4,000,000, but it must not be supposed that the profits of the mining industry of Butte and of Montana are represented in the above table. Many of the richest mines are owned by private parties who make no public statement of their profits, while others are close corporations, having no stock on the market, and under no obligations to make dividend or other statements.

NEVADA.

Notwithstanding the many districts in the State of Nevada, the bulk of the bullion product still continues to come from the Comstock lode. The *Virginia Chronicle* states that the total bullion yield of the State in 1889 did not exceed \$8,500,000, against a total product of \$10,525,000 in 1888. The falling off is due to a lack of milling facilities for handling Comstock ore, and not an exhaustion of the resources of the mines.

Of the total bullion yield of the State in 1889, the Comstock lode produced about \$5,250,000, the product of the lode being outtailed more than a million below what it would have been had there been sufficient water-power to operate the Carson-river mills throughout the summer, which, from that cause were shut down from early in June until the middle of November.

The snowfall of the present winter has been ample to supply water for milling purposes two months later than last year, and the prospect is, therefore, favorable that the yield of the lode in 1890 will exceed that of 1889 by at least \$1,000,000, as the draining of the Gold Hill mines will add a large area to the present ore resources.

The assessments levied by Comstock mining companies in 1889 foot up to a total of \$1,831,050. The bullion product of the lode exceeds

by nearly \$4,000,000 the total sum of assessments levied.

The total ore product of the Comstock lode during 1889 aggregates about 215,000 tons, the royalty on which, when paid, will add that number of dollars to the treasury of the Comstock Tunnel Co. The income of the Virginia & Truckee Railroad Co., for the transportation of the bulk of this ore to the Carson-river and Nevada mills, will not fall far short of \$175,000, and the revenue of the mill companies for crushing it foots up to \$1,225,000.

Dan De Quille, in a letter from Nevada to the *Salt Lake Tribune*, says that from what is now to be seen it is safe to say that Nevada's yield of the precious metals for 1890 will fall little short of \$12,000,000. This will be owing to a milling season that will probably last until the middle of July (so great is the depth of snow already heaped up in the high Sierras), to the opening of new mines in the eastern part of the State, and to the yield of gold placers which will next spring be opened near our eastern border at Jeff Davis peak, and in places in White Pine county, where good prospects have been obtained.

The Comstock mines are still showing large quantities of ore. This is of a low grade compared with that taken out in the old bonanza days, yet, with plenty of water and economical working, can be made to pay a fair profit. At the Gold-Hill end of the Comstock lode preparations are being made for pumping out the old lower levels and the resumption of mining below the level of the Sutro drain tunnel. The Gold Hill mines still have considerable bodies of low-grade ore above the Sutro tunnel, but as large areas of better ore are known to exist in some of the old higher levels, the companies having enough ore naturally desire to be mining it; also it is desirable to have it in order, that it may be mixed with the ores of lower grade.

As there is a heavy fall of snow on the interior ranges of mountains, the miners in those mountains will have a good season this year, as well as all the ranchmen of the interior valleys.

The heavy fall of snow will give the Hydraulic M. Co. at Osoola a grand season. Undoubtedly they will next spring and summer wash out a vast deal of gold. Much gold will also be likely to be taken out at the newly discovered placer mines in Robinson district. These placer mines will no doubt be of great assistance to the people of White Pine county, and indeed to all in the eastern part of the State.

In Pioche the prospects of the miners are brightening, and the day may come when that town will enjoy more than its old-time prosperity. A railroad would give that whole region a big boom.

Some good mines are being opened in Nye county and in Lander about Austin. Also about Eureka some good strikes are being made both in old and new mines, and the prospects of the town are beginning to brighten.

Tuscarora holds its own well and much bullion is being shipped from the leading mines. The people of Tuscarora anticipate good times next season. The Paradise Valley mines are also doing well, and in Humboldt county some mines are being opened that bid fair to prove very valuable. Hawthorne district, in this part of the State, continues to prosper. Nearly all the veins worked are gold-bearing and some are astonishingly rich. It is "the poor man's district," as very many of the veins pay from the start, and though generally small, pockets are occasionally encountered that yield snug little fortunes.

At Aurora times are improving, and at Candalaria the Mt. Diablo is still making fair shipments of bullion.

About Silver City the miners are so situated as to make the most of the water that will flow through their town next spring. They will this winter get out a good deal of ore from the many little gold veins for which their town has been famous the past 30 years. This ore the mills near there will be able to reduce when the snows begin to melt on the mountains.

At Eureka, notwithstanding the comparative inactivity of the Richmond and Eureka Con. companies, the prospects of the camp are brighter than could have been expected a year ago, and if business is dull there are at least reasons for believing that the spring will open with greater activity than any preceding season for years past. The *Eureka Sentinel* says these reasons are the sale of several mines on Prospect Mountain, the fine developments and excellent prospects of those and neighboring properties, the strong probabilities of sampling work to be erected in the near future, and the great reduction of rates for the transportation of ore to other markets, that have made it possible to work and mine the low-grade ores of the district.

There are a large number of mines that are lying idle where pay ore may be found, many of them having large deposits of low-grade material that, differing from the past, can now be worked with big profit to the owners.

We have each week during the past year given in our "Mining Summary" a record of progress in the various camps in Nevada, and it is impossible to mention the hundreds of mines that are being developed. The great mineral region bordering on the Carson & Colorado railroad has scarcely been touched, and there are abundant opportunities for capital in most of the districts. Many of these camps have been neglected by capital for years, and the miners themselves can do little toward developing these

properties unless they are assisted. There are plenty of good properties in that region, which, if handled by moneyed men, would be very valuable. This is not only the case in the section referred to, but elsewhere in the mountains of Nevada.

NEW MEXICO.

The record of bullion production of this Territory is given elsewhere in this number of the Press. The Silver City *Enterprise* published on the first of this year an illustrated edition giving details of work in the various camps, and from these articles we condense the statements here presented. The Georgetown region is the most prosperous mining section of the Territory. The output from the camp for years past has been so regular that the public in general now regards it as a matter of fact, and the shipment of \$10,000 or \$15,000 in bullion and several cars of rich ore in a week or month attracts but little attention.

From Alex. McGregor, now in charge of the property, the *Enterprise* learns that the lowest grade ore taken from the mines averages 51 ounces, while the average of the mill-run for the year was \$6 6 ounces. This does not include the very rich ore, which is usually shipped to Socorro for treatment. Seven tons of this class of ore shipped last month returned \$5000. This is somewhat above the usual high-grade ore, and is given simply to show that Georgetown can produce ore of as high a grade as any other camp in the country. During the past year the output of the Mimbres Cons. Mining Co.'s property was 290,400 ounces, which was unusually light, owing to the immense amount of deadwork being done.

The leasers last year took out of the McNulty mine \$20,000. Rahy and Vellines are the names of two new camps, distance respectively six and eight miles from Georgetown, in a southeasterly direction. They appear to be an extension of the Georgetown mineral belt.

In Grant county (where Silver City is situated), the mining industry leads all others in point of capital invested, returns received and the almost unlimited field for exploration which yet remains open for the energetic prospector. As yet, the various mineral zones throughout the county have, at the very best, been imperfectly prospected, in short, indulging in a term in common parlance, that which has been accomplished consists of the merest scratching.

The silver-bearing areas may be divided into two distinct districts—the one at Georgetown and Bear Mountain (Fleming), and Chloride Flat, constituting the lime, quartzite and porphyry, and Black Hawk the granitic, or, as it is frequently termed, syenite, the other. Following the discovery of gold came the location and development of the wonderful deposits at Georgetown, Chloride Flat, Fleming and Black Hawk, which unitedly have yielded, in a little more than a decade, over \$15,000,000 in silver; and, while to many the term deposit is indicative that complete exhaustion of ore bodies follows development, late explorations of the lime areas conclusively show that the virgin ground is proving to be fully as rich and as productive as the territory first exploited. The larger portion of the ore is free milling, and the advantage of home treatment of the low grades has built up and sustained a population noted for its energy, thrift and enterprise. The higher grades, carrying from \$100 to \$500 per ton, are shipped to distant points.

The lead ores are principally carbonates, yielding from 20 to 60 per cent in lead to the ton, and from \$20 to \$150 per ton in silver. Cook's Peak has been carefully exploited and developed, and the yield has proven a bonanza to the owners.

The zinc interests are specially noted for their extent, high percentage, and the purity of the mineral carrying this metal. The mineral zone bearing this metal is confined to the southeastern portion of Hanover gulch, in which a dozen or more claims have been located. Zinc smelters in the East are offering \$24 per ton for zinc carbonates, which leaves to the miner a small margin after all mining expenses have been paid, which includes transportation to the eastern side of the Mississippi river. Carload lots are now transported at rates not exceeding \$10 per ton.

There are three gold-mining districts in Grant county—Pinos Altos, Carlisle and Gold Hill. The veins in each are true fissure, and occur in the granite rocks. In width they range from 6 inches to 20 feet, and the general strike is from a few degrees east of north to an east and west course. Free vanners and other machines are used for concentrating the ores, and the resultant concentrates are shipped to distant smelting establishments, where they are sold. Pinos Altos at present is the leading producer, but it is a mere question of time before Gold Hill and Carlisle will rapidly come to the front and show up quite as handsomely as their more fortunate neighbor. It is a noteworthy fact that the gold mines in the districts alluded to are easily and cheaply mined, and the attendant expense of timbering is not nearly so great as in other countries as favorably situated as New Mexico for mining purposes. The gold bullion produced annually foots up about \$750,000, which is mined at an expense of about \$500,000, leaving a profit of \$250,000, or 33 1/3 per cent on the investment. There are several large companies constantly engaged in developing their property.

Among other districts, Hanover gulch is pre-eminently rich in copper ores. Thousands of tons of iron are also shipped annually to the smelting establishments of El Paso and Socorro.

Bald Mountain is among the latest discovered of the many districts tributary to Silver City. The Silver King mine, in that district, is a wide and defined vein with a value of \$15 to \$25 a ton. The "Three Sisters" Peaks and district of that name is a very prominent landmark of the southern-central portion of the county. The yield of ores has been remunerative and the faith in the future of the camp has prompted several of the owners to protect their claims by U. S. patents. A sale of \$15,000 was consummated during the early summer of 1889.

At Hachita the "blanket veins" are of extraordinary width and the lead riches have an average of 30 per cent of lead to the ton. The discovery of these deposits is quite recent, and the investment of El Paso capital is intended to foster the smelting enterprises of that city. Thus far the mines have proved better than represented, and it is more than probable that the present output of 350 tons per month will by the first of May be increased fully 100 per cent. The ore carries from \$8 to \$30 per ton in silver.

The Sierra mines of Lake Valley, after some vicissitudes, are making ore shipments from 15 to 20 cars per month. The mines of Lake Valley are not second in importance to any in New Mexico. They have paid about \$2,000,000 in dividends to their owners. All the mining claims of the group are now owned by one company, the Silver Mining Company of Lake Valley.

Lordsburg is surrounded by rich mining camps, all of which are directly tributary to it. To the north are Carlisle, Malone and Gold Hill. To the south are Hachita, Pyramid and Shakespeare, and to the west is Stein's Pass. Shakespeare is one of the oldest mining camps in the southern part of the Territory, having been a large producer before the Southern Pacific road was built. There are in this camp some of the largest ledges of low-grade ore in the Southwest. Two large companies are now operating in the camp. The Hercules Co. headquarters at Memphis, Tennessee, has a 10-stamp mill at work, and intends soon to largely increase its capacity. The Standard Mutual Co. of Baltimore has a small mill at the camp and is now negotiating for a reduction and smelting plant, which will handle 100 tons of ore per day.

At Carlisle, 100 men are now employed. The lead contained in the ore on concentration has been quite profitable. Concentration is effected by the aid of 36 Frue vanners. The monthly output averages \$10,000. A Westinghouse electric plant is being placed in position for the use of the mill and buildings occupied by the company. Under the new management the company is rapidly regaining lost ground.

At Pinos Altos, the gold camp, are a number of producing mines. The outlook for the camp, notwithstanding adverse circumstances, is flattering, and the oft-repeated alarm which has been sounded that values in the ore cannot be saved is without foundation in fact, and with careful business tact and skillful management, the output for the year, \$350,000, will be increased during 1890 to at least \$3,000,000 in gold.

OREGON.

In a recent address before the Board of Trade of Baker City, Or., Hon. James P. Faulk said: Among the first counties that attracted attention as a favorable field for mining, Baker county was foremost. Away back in 1862, when but little was known of what now constitutes the Great Inland Empire, gold was discovered at Auburn, and a stampede of miners, speculators and many others flocked to the new gold-field. Other discoveries followed, such as Winterville, Parkerville, Robinsonville, Granite Creek and a number of others, which, during the following season, produced about \$5,000,000 worth of gold-dust. No attention was at that time paid to quartz mining, and no quartz mines of a productive character had been discovered except the Virtue mine, which produced many thousands of dollars and was worked spasmodically for many years, and produced nearly three millions of money.

After the exhausting of the rich placers, mining remained quiet for a number of years. Attention was diverted toward mines of gold, silver and copper and other precious and useful metals, and each succeeding year added new and important mining properties to those already uncovered, until now we are the most important county in the whole State in the production of metals, both precious and useful. Among the important mining companies operating in this county I will name: The Connor Creek Mining Co., located at Connor Creek; mill of 35 stamps; the Eureka & Excelsior M. Co., located at Cracker Creek; mill, 20 stamps; the Gold Ridge M. Co., mill, 10 stamps; Bonanza M. Co., mill, 10 stamps; Virtue M. Co., mill, 20 stamps; White Star M. Co., mill, 10 stamps; Elk Horn M. Co., mill, 10 stamps; Cleveland M. Co., mill, ten stamps; Oregon Gold M. Co., Cornucopia, mill, 20 stamps; Auburn M. Co., mill, five stamps; Miner M. Co., mill, ten stamps; Elk Horn Extension M. Co., mill, ten stamps; La Bellevue M. Co., mill, 20 stamps; Monumental Silver M. Co., mill, 20 stamps; Golden Monarch M. Co., mill, ten stamps; Baker City M. Co., mill, ten stamps; Worley M. Co., mill, ten stamps; Phoenix M. Co., mill, ten stamps; Evening Star M. Co., mill, ten stamps. Added to these are as many that are operating with arrastras.

Many additional mines ship their product to the smelters at Denver, Salt Lake, Puch-

lo and San Francisco, and many more are only in an incipient stage of development, which will be among the future bonanzas of the Pacific Northwest and enrich the owners and the State millions of dollars. Take a retrospective glance over the past five years, and see what has been accomplished in our mineral development. When the railroad was completed, our mines had received no attention from capital. We were a terra incognita to the adventurous speculator, and they both turned from us with contempt or pity when we mentioned our mines. All this is now changed. Capital now seeks investment in our mining properties, and the ever-necessary middleman and promoter is always with us. Our limestone and lime have attracted much attention, and shipment of many trainloads has been made. That which has been made is only an atom of what will follow.

UTAH.

A tabular statement of the bullion product of Utah is given on another page, showing in some detail the character of the metal output.

Mining in the Territory has been generally successful. Still the status of the lead question, as regards foreign importations, has been unsatisfactory to the lead miners, and the discount on silver has also been a detriment. The base metal and ore output from Utah to foreign points for the year show a decided increase over last year.

The Salt Lake *Tribune* gave the best summary of the mining industry of last year of any paper on the coast, including not only the mines of Utah, but those of Montana, Idaho and Wyoming. From the various articles in that paper we make up the following notes:

Tintic district had a very prosperous year, and has developed so well as to establish it as the next to the best in Utah. The Eureka Hill property is now down 900 feet and they employed last year an average of 200 men. The Bullion Beck and Champion property is doing well, having divided \$300,000 among its owners last year. The Centennial-Eureka product in 1889 was 1,827,000 pounds, which gave a net product of 243,141 pounds of lead; 29,287 pounds of copper; 86,656 ounces of silver, and 292 ounces of gold. A dividend of \$22,500 was paid. The Gemini group, the Eagle, Summit and Lookout and others have done well. The Northern Spy produces very high-grade ore. The Mammoth paid \$120,000 in dividends last year.

In Beaver county, as to the Horn Silver, the full work of the property has not been made public, but shipments have gone on steadily all the year.

The Hanauer smelter output last year was 4635 tons of lead; 582,650 ounces silver and 6250 ounces of gold, valued at \$900,000. The Germania lead works made a good showing for the year, and yet were idle part of the time. The Germania furnace's production for the year ending Dec. 31, 1889, estimated from December 18th to 31st. The furnaces were out of blast January 1st to June 15th.

	Gross wt. lbs.	Lead wt. lbs.	Oz. Silv.	Oz. Gold.
Base bullion...	4,796,730	4,761,686	364,516.53	4,361.31
Selected lead...	2,359,540	5,859,540
Copper matte...	270,943	14,176	8,350.64	7.22

The Mingo Co. statement is as follows: During the year this company ran through its furnaces:

Ore, matte and fine dust,	79,660,000 lbs.,	39,830 tons.
Fluxes:		
Iron ore,	5,654,698 lbs.,	2827 tons.....
Limestone,	17,382,125 lbs.,	8691 tons.....
Fuel used—		
Coke and charcoal,	10,090,000 lbs.,	9545 tons.....
Coal and slack,	9,335,000 lbs.,	4669 tons.....
		16,730

Lead,	11,978,639 lbs.,	5939 tons.....
Copper,	538,610 lbs.,	269 tons.....
Silver,	592,517 ozs.,
Gold,	6168 ozs.,

At Park City the Octario property still stands at the head of producing mines of the district. During the year 1889 its product was:

Bullion from ore crushed.....	\$901,798 42
Ore shipped 9330 tons.....	763,000 00

Total.....\$1,654,798 42

The Daily property moved along with its production and development regularly during the year and is now in better condition than ever. During the year its product was 296,163 ounces silver, 296 ounces of gold of a gross value of \$253,017. The ore sales were \$328,264. The sulphides sold for \$435,420.

The Crescent shipped 3273 tons of ore and cinnabar, valued at \$145,564. During the past year mining operations have been conducted steadily on a moderate scale in Little Cottonwood district. The Emma, Flagstaff and Vallejo have been industriously prospecting for bonanzas similar to those that made this camp famous in years not long passed, and the indications are such that those interested have well-grounded hopes that large bodies of ore will again be developed.

At Stockton the Honerine Co. shipped 2200 tons of \$40 ore. At Bingham the Lead Mining Co. made an output of 16,200 tons first-class ore and concentrates. This yielded 5500 tons of lead and 150 ounces of silver. From this camp there were shipped by various mines 21,041 tons of ore; showing a very prosperous condition of affairs. At Silver Reef the Stormont shipped last year \$37,504 and the Christy \$46,201. The Utah coal-fields are now quite important and make large shipments. The Pleasant Valley Coal Co. shipped 141,049 tons, Union Pacific 65,711 tons, and Home Coal Co. 36,135 tons, besides a home consumption of about 63,000 tons.

Assessment Notices.

Gray Eagle Mining Company. Location

of principal place of business, San Francisco, California. Location of Works, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 21st day of January, 1890, an Assessment, No. 16, of Four (4) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-fifth (25th) day of February, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 17th day of March, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUEFINGTON, Secretary,
Office, Room 11, No. 303 California St., San Francisco, California.

List of U.S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING JAN. 21, 1890.

419,998.—PILE COVERING.—H. Anderson, S. F.
 419,938.—GOLD-SAVING APPARATUS.—O. H. Bagley, Knappa, Or.
 419,919.—SPITTOON.—A. F. Brown, S. F.
 419,820.—HARROW AND CULTIVATOR.—A. C. Brown, Eugene City, Or.
 419,632.—MACHINE FOR CLEANING FIBER.—W. L. Brown, S. F.
 419,842.—PIANO SOUNDING BOARD.—A. J. Dewing, S. F.
 419,843.—FILTER.—J. G. Divoll, Oakland, Cal.
 419,705.—CAP, PILLOW AND LIFE-PRESERVER.—F. Frank, Grass Valley, Cal.
 419,851.—MACHINE FOR WRAPPING BLOCK MATCHES.—Geo. Grisel, S. F.
 419,992.—CABLE RAILWAY.—L. Heynemann, S. F.
 419,679.—FIFTH WHEEL.—H. P. Kelly, S. F.
 419,680.—TRANSON LITTER.—James Kelly, San Diego, Cal.
 419,681.—TRANSON LITTER.—James Kelly, San Diego, Cal.
 419,691.—CULTIVATOR.—S. T. Likens, Amity, Or.
 419,692.—SASH FASTENER.—D. O. Livermore, Los Gatos, Cal.
 419,874.—VALVE GEAR FOR FLUID RAMS, ETC.—John Parker, S. F.
 419,726.—NEUTRALIZING SULPHO-CHLORINATED ORGANIC COMPOUNDS.—A. Sommer, Berkeley, Cal.
 Note.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PIANO SOUNDING BOARD.—A. J. Dewing, S. F. No. 419,842. Dated Jan. 21, 1890. This improvement in the sounding-board for pianos consists in certain details of construction. In the usual construction of sounding-boards they are made of selected spruce or pine cut into narrow strips having parallel sides, these strips being glued together until a board of sufficient size has been formed, and the board is further strengthened by suitable cross-braces secured upon its back. The method of applying strings to the piano is such as to obtain a proper length of strings for the various portions of its register from the lowest bass to the highest treble, and the construction of the sounding-board before described is such that the boards become very short at either end. This invention is designed to give a greater length and a corresponding improvement to the tone of that portion of the sounding-board upon which the bridge supporting the bass and longer strings of the piano are fixed; and it consists in making a central portion of the sounding-board of strips which are narrower at one end than the other, so as to gradually change the direction of the strips and bring those toward the lower end of the sounding-board into such a position as to extend from side to side instead of diagonally.

GOLD-SAVING APPARATUS.—Olin H. Bagley, Knappa, Oregon. No. 419,908. Dated Jan. 21, 1890. This is a machine principally intended for saving gold from black sand. The riffle has a recessed face formed by turning the material at one side of the riffle back upon itself, said riffle having projecting end flanges or wings. The whole table is suspended at an inclination on hangers so it gets an end-bump and side-shake. The gold-bearing sand and sufficient water are fed upon the head of the table, and, passing first over a grooved plate, the current is broken and sufficiently retarded to prevent the stuff from rushing too fast over the first riffle of the series. Then meeting said riffle, a separation of the gold from the sand takes place, the gold being caught by the beveled or recessed face of the riffle, and spreading out to each end thereof, leaves the sand and water about the center of the riffle over which it flows, and repeats the action on the next riffle. At the ends of each riffle the flanges or wings prevent the water from splashing sand or gold over the ends and keep the sand and water nearer the center.

STATIONARY SPITTOON.—Alonzo F. Brown, S. F. No. 419,919. Dated Jan. 21, 1890. This stationary spittoon is specially useful for railway cars or carriages. It consists of a concaved depressed surface which is fitted into the floor of the car or other place where it is to be used, and has a central opening through which the contents may escape, and in combination therewith of a valve which may be opened either automatically or by pressure of the foot upon the connecting or operating pin. This pin extends up through the floor, and by simply pressing the foot upon it, the elasticity of the spring will be overcome and the valve will be opened so as to allow the contents of the spittoon to be released. Immediately upon releasing the pressure, the spring closes the valve again and thus keeps out the wind and dust.

VALVE-GEAR FOR FLUID-RAMS AND PISTONS.—John Parker, S. F., assignor of one-half to Hugo P. Frear. No. 419,874. Dated Jan. 21, 1890. This invention relates to that class of

machines to be operated by water or other fluids, and usually known as fluid-rams or pistons, and the invention consists in the novel mechanism for operating the valve and controlling the motion of the ram or piston. The object of the invention is to provide a simple and effective mechanism for safely controlling the motion of the ram.

PILE-COVERING.—Henry Anderson, S. F., assignor to R. J. Davis. No. 419,998. Dated Jan. 21, 1890. This is an improved covering for piles which are driven for building wharves and other similar purposes. The pile is oased in sections of sheet metal curved to fit the pile and having flanges by which they are united together by bolts when placed about the pile. This patent covers a method of breaking joints and also protecting the pile at the place where the joints occur.

MACHINE FOR WRAPPING BLOCK MATCHES.—Geo. Grisel, Golden Gate, assignor of two-thirds to Frank Severio and J. D. Case. No. 419,851. Dated Jan. 21, 1890. This invention relates to that class of wrapping machines designed for folding or wrapping paper about such things as block matches. The invention consists in a series of traveling axially-rotary holders for the match blocks, whereby said blocks are rotated and wrap the paper about them. There is also a paper feed clamp for holding the paper to the blocks, knives for cutting it into suitable lengths, a roller for pressing the paper down on the blocks, means for discharging the wrapped blocks from the holders, and various mechanical powers and movements to effect the several operations. The object of the invention is to wrap such articles by machinery.

FILTER.—J. C. Divoll, Oakland. No. 419,843. Dated Jan. 21, 1890. This invention consists of a flattened disk-shaped filter chamber connected at the top with the faucet or inlet pipe and having a discharge pipe below. Within the horizontal disk is fixed the filtering medium. A faucet plug extends down through a central barrel, and by means of passages arranged in this plug, and openings in the sides of the barrel, above and below the filter, the water may be admitted either above or below the filter. This is effected by simply turning the plug half around, and when the water is admitted to one side of the filter the passages in the barrel allow it to enter the barrel from the opposite side of the filter so as to be discharged. The filter is reversed by turning the plug half around and is thus easily cleaned.

A New Music-Leaf Turner.

A Welcome Invention in the Musical Line.

Many attempts have been made to produce the means that would enable a performer to turn the leaves of music without any assistance from the hands, but complete success has only been achieved recently.

Mr. Daniel Schuyler of San Diego, California, who is a musical enthusiast, has given considerable time for 22 years in solving this problem, which has so long agitated the minds of musicians, and the result is a completed machine that seems absolutely perfect for this purpose. It is adapted for use with any musical instrument and all sizes of sheet music and music-books. It is pleasant to note that so ingenious a device has been perfected by a California musician and inventor.

When the music is placed upon this apparatus, the leaves are clasped by artificial fingers, and the performer can then, by a slight movement of either foot, turn the leaves to the right or left, back and forth, quickly or slowly, any required number of times, and with more certainty and precision than if done by the human hand, thus relieving him from one of the greatest annoyances while rendering rapid and difficult music.

The leading artists of San Francisco, as well as the dealers in musical merchandise, have carefully examined this device of Mr. Schuyler's, and, without a single exception, have indorsed it in written testimonials, two of which we give below—one from an artist who has but few equals in this world, and the other from a well-known commercial house.

SAN FRANCISCO, Jan. 24, 1890.

Mr. D. Schuyler—DEAR SIR: Permit me to express to you my great appreciation and delight on examining your "music turner." I heartily indorse it, and feel it will be a great boon to all musicians and lovers of music. The turning of the leaves back and forth has excited my greatest wonder, and I hope you will meet with abundant success. Very respectfully,

S. MONROE FABIAN,

Professor of Music.

HISTORY B'LO'NG, SAN FRANCISCO, Jan. 25, 190.

Mr. D. Schuyler—Having personally seen and examined your instrument for turning the leaves of music, which you term the "D. Schuyler music turner," we wish to express our unqualified appreciation of it, and confidently predict that as soon as you have the apparatus ready to place on the market, either as a permanent attachment to a piano or separate, it will have a large sale. We hope that you will keep us thoroughly posted, and send us a sample with prices as soon as you have them ready to supply, as we are confident that we can dispose of a great many in connection with our piano and organ department. Wishing you every success, we are very truly yours, THE BANCROFT COM'Y.

By W. B. BANCROFT, Sec'y and Man'r.

We are informed that this long-awaited-for "musician's friend" will soon be placed within reach of those desiring to keep pace with this progressive age.

The patent business in connection with this invention was transacted by the firm of Dewey & Co.,

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.**NEW COMMON SENSE STEEL WHIM.****All Complete for \$150.**

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be hauled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer
and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

**BUTTE, MONTANA,**

The railroad, mining and commercial center of the new State, offers some of the best inducements for investments in

Real Estate, Mines & Mining Stock

of any locality in the Northwest. For particulars address The Evans-Terry-Clausen Brokerage Co., 41 E. Broadway, Butte, Montana.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Silmo Tables. Trommels, Wire Cloth and Punched Plates. Oro Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❖ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL. ...

IMPROVED STEAM STAMPS

Holisting Engines,
Safety Cages,
Safety Hooks,

ORE CARS, WATER & ORE
BUCKETS,

Air Compressors,
Rock Drills, Etc.

GENERAL MILL AND

General Offices and Works: **FULTON AND UNION STS., CHICAGO, ILL.**

BRANCH OFFICES: NEW YORK, Room 43, No. 2 Wall St. DENVER, COLO., 1318 Eighteenth St. SALT LAKE CITY, UTAH, 7 W. Second South St. LONDON, ENG., 23 Bucklebury, E. C. CHIHUAHUA CITY, MEXICO, No. 11 Calle de Juarez. LIMA, PERU, South America. JOHANNESBURG, TRANSVAAL, South Africa.
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels especially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents,

Successors to CHAS. CALLAHAN

IMPORTERS AND DEALERS IN

CAST and WROUGHT IRON SCRAP
SECOND-HAND BOILERS
AND OLD MACHINERY
Of every description.

The Highest Price paid for all kinds of Metals.

OFFICE AND YARD: 128 and 130 Folsom St., S. F.
Telephone No. 67.

FOR SALE

Hydraulic Mining Property in Southern Oregon. Good, Extensive. For particulars (Principals only) address,

"A. M." Box 77,
Grants Pass, Oregon.

THOMAS PRICE & SON,

Assay Office, Chemical Laboratory,

BULLION ROOMS and ORE FLOORS,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

SELBY

SMELTING and LEAD CO.,

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY
And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

MANUFACTURERS OF

BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

68 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Agents for the Morgan Crucible Co., Bathurst, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Jan. 30, 1890.

The weather and general transportation business have gone from bad to worse, with the end apparently not yet. Trade is in about as badly a demoralized condition as it can possibly be, notwithstanding which all business men are buoyed up with the impression grounded on past experience, that the future holds in store more general prosperity than has been witnessed for several years past. Confirmed advices are at hand going to show that previous to the rains a large majority of the farmers and others who overbought during the land-boom of two or three years ago, have either about worked out of debt or had arranged their indebtedness in such a way as to meet it without any great inconvenience. The call for men to work on the different railroads has given employment to a large force of idle hands. Previous to this there was great suffering among many day laborers. Even now there are large numbers out of employment, only finding work during fair weather.

Money is not, as a rule, close. The disbursements since the beginning of the year have been quite heavy. Remittances from the country are light, owing to bad roads. A steamer from Portland, Oregon, brought in the past week over \$235,000. Other coast steamers brought in sums ranging from \$500 up to \$50,000 and over.

MEXICAN DOLLARS—There was fair trading during the week, chiefly by Chinamen. The price ranged from 76 to 76 1/2 cents.

SILVER—The English market advanced up to Monday, when bullion was quoted at 44 1/4; on Tuesday it fell off two points, being quoted at 44 1/4, and yesterday four points, closing at 44 1/4. The sensitiveness of silver confirms its friends in their previously expressed opinion that the metal is not only scarce, but also that the production is not equal to the world's requirement. This is quite marked when India or any other large buyer enters the market, by the rapidity with which the price advances, and after each upward move it does not fall to as low a figure as it started from. It now looks as if silver will offer for some time, or until the United States comes to its rescue, a fine opportunity for speculation. Mail advices from Washington report the Silver Committee appointed by the St. Louis Convention actively at work trying to secure free coinage, and to that end they are in consultation with representative bimetalists in all parts of the Union.

In our market, silver bullion gradually advanced, until on Tuesday as high as 98 cents was paid by the Mint, although the largest proportion of its purchases on that day was made at 97 1/2 cents. At the latter price the market was cleaned up of all small parcels. Large holders of silver are not in the market as sellers except at higher prices. On Tuesday, with silver at 44 1/4 in London, and at that day's quotations for sterling exchange, the parity of silver in our market was about 98 1/2 cents. Exporters had an advance the past week for silver, going as high as 97 1/2 cents last Monday.

London cablegrams came through to-day quoting silver at 44 1/4. At to-day's rates for sterling exchange, the parity would be in our market about 98 1/2 cents. There is no silver offering here, but as this is "Department Day" in Washington city, that which has been offered there was not known up to this writing; however, as the Mint had cleared up our market of all available parcels, it is not at all likely that any was offered for sale to the Department.

QUICKSILVER—Receipts the past week aggregated 150 flasks, and exports by sea 40 flasks to Mexico and 24 flasks to Mazatlan. Bad and almost impassable roads have largely reduced receipts, causing quite an advance in the market. Sales were made the past week up to \$50, at which price the market closed.

BORAX—Receipts the past week aggregated 500 casks. The market continues strong at full figures. There was exported 100 lbs the past week, to Mexico.

LIME—Receipts the past week aggregated 477 hhls, and exports by sea, 200 hhls to Honolulu. The demand is still slow, owing to unfavorable weather.

LEAD—Imports the past week aggregated 489 pigs from London. The market is essentially unchanged. The output of the mines, owing to bad weather, is considerably curtailed.

COPPER—The market has held fairly strong throughout the week. The absence of late telegraphic market reports (not quotations) of the Eastern and European markets, leave us in the dark as to late influences on the market. The following late mail advices we obtain from the Paris correspondence of the London Mining Journal, under date at Paris of Jan. 9:

"It is generally believed in France that the copper possessed by the Comptoir d'Escompte can be gradually disposed of at considerably above \$40 per ton. The shareholders' action in indorsing the policy of the liquidators has had the effect of further strengthening the market for copper mining shares, and these are rising in prices. Rio Tinto shares have advanced to francs during the past few days. Financial authorities in Paris speak, as a rule, pretty hopefully upon the future of the copper market. They regard it as probable that it will continue to maintain the firmness which it has lately developed, and that prices will be subject to a movement of steady advancement under the legitimate influence of decreasing stocks and expanding consumption. The action of the shareholders of the Comptoir d'Escompte is taken as conclusive proof that no attempt even will be made to reconstitute the former monopoly. It is urged that the present conditions of the copper market afford every reason for the belief that it will be able to absorb in time the stocks that have been left as the outcome of the unfortunate syndicate incident. The great extent to which copper is being used in new engineering and electric-lighting schemes is another important point in favor of a hopeful view of its future. The only danger which is regarded as really likely to interrupt the prosperous development of the copper market is that of overproduction."

TIN—Imports the past week aggregated 38,499 boxes of plate. The market for spot plate is heavy and dull under liberal offerings by weak holders. The last reported sale was \$4.60 to a leading can manufacturer. For shipment, no business can be

done at asking prices. For pig tin the market is slow and easy.

IRON—Imports the past week aggregated 120 tons of pig iron from Irondale. The market is slow but very strong. Holders are not willing to make concessions, believing that with renewed business they may be able to obtain an advance. The destruction of bridges, etc., by high water, it is claimed, will create a more active demand for pig to be used in the building of new bridges.

COAL—Imports the past week aggregated as follows: From Baltimore, 1812 tons; Coos Bay, 1200; Port Townsend, 1149; Seattle, 2500; Departure Bay, 2350; Sydney, 850; total, 8851 tons. The market continues strong at unchanged quotations for prompt shipment of Australia. The spot market and near-by arrivals of Australian are steadier. In coast coals there is nothing new to report. The demand for coals is only fair, but a decided increase in the consumption of steam coals is looked for with more settled weather.

Eastern Metal Markets.

By Telegraph.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

BELTING—Alex Heins, successor to Heins & William, commenced operating in 1887 a leather and felled rawhide belting factory, located at 504 Front street. His business was increasing so much that it was necessary to look for more room, and he has lately removed to 134 Main street, where he now has one floor of 46x120 feet, with steam-power. This shows that Mr. Heins is making progress with his business, and mining men will do well to call on him for anything in his line.

Mining Share Market.

Trading the past week under review was quite light; hardly enough business was done to deserve calling the transactions "a market." The snow-blockades having laid an embargo on news from the principal speculative mines, the outside public groped in the dark worse than ever before; and to see cinchers of insiders or any other persons searching for points how to get the best of those who supply through tools, the street points, is very much like blind persons trying to get other blind persons to lead them by echoes. The return of Capt. Voll is looked upon by some as a forerunner of a market, or in other words he is a John the Baptist of the market; but who is to be the Savior of the market is not yet decided by the special friends of the three absent magnates—Col. Mackey, Louis Schloss and Herman Zidig. So far as the average outside traders are concerned, they care very little who will offer himself a sacrifice so long as they make the money. They only "lick" when they lose and "the other fellow" makes. Points are now out for lower prices in the Comstocks, notwithstanding the outside have been steady sellers. Continued bad weather and big hear reports have disgusted many. Outside stocks have also been dull. The Tuscaroras have been easing off; the Quijotas were barely steady, while the Bodies appeared to be the firmest.

The Western Union Telegraph Co. ought to see the Commonwealth Mining Co. for damage, for each time the line gets to working a telegraphic shipment of bullion is sent from the mine, when down goes the line, probably to keep company with McGinty. A patron is informed that there is no truth in Charley Elliott and J. W. Pew having formed a trust mining secretariety under the firm name of Elliott-Pew Secretary Trust Co. Probably it is owing to Mr. Elliott's being secretary of so many of the Comstock mines and Mr. Pew of its outside mines that such a report originated, if it originated at all.

Owing to the heavy deposits of snow at Virginia City, only three mines, the Occidental, Justice and Alabama, are reported to be crushing ore. It is claimed that the others will resume crushing ore within a few days.

The net cash bullion output of the Crown Point mine in last December was over \$40,000, which paid up all indebtedness and allowed of the carrying over of a surplus into January.

A subscriber sends the following: "Will you please inform a stockholder if A. C. Hamilton, superintendent of Chollar, Potosi, Alpha, Exchequer and New York Con is paid a salary while he is traveling around the country? Also if Sam Jones of the Crown Point and Belcher is paid a salary from the assessments of those mines while he is visiting mines in California and Alaska? Also if Col. (?) Keating, of the Norcross and Savage, is allowed his salary of \$50 per month while he visits the Tuscaroras mines and spends at least one-half of his time in San Francisco? By answering the questions you will greatly oblige a stockholder."

In reply to the above we will state that a prominent mining official in this city, when asked if the superintendents drew salaries while absent on other business than that of the mines, said, "Why not? Of course they do. What do you take them for?" We know of quite a number of persons, the writer included, who would for less than one-half the salary agree to remain away from the Comstock all the time and write up the work going on in the mines besides.

News from the mines on the Comstock is difficult to get. If our previously received advices were reliable, the work in two or more of the mines ought to have either reached or will soon reach very interesting points. With mail communication resumed between San Francisco and Virginia City, we ought to get more bullish news, such as should favorably influence the mining share market. From the Tuscaroras the same old reports come to hand, which bring assessments. From the Bodies no news is at hand, but those who ought to know are very confident of good results following the change in the superintendence of Bodie; at any rate they claim that there are rich bowlders in the mine, one or more of which are liable to be run into at any time, and if reported favorably the stock could be made more active at higher prices. Of course these men are too honest to sell stock on a bowlder strike to outsiders—unless to collect assessments so as to run the mine. From the Quijotas good news continues to come to hand, but the stock does not advance; which causes persons to doubt the news even if it is given in official letters.

NO BULLION SHIPMENTS—Owing to the continued blockade of the railroads in the mountains, no bullion shipments have been received from the mines for two weeks past.

Table of Lowest and Highest Sales in S. F. Stock Exchange.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds,
has a capacity of three tons per hour of hard
quartz to 40 mesh; has been thoroughly
tested; we guarantee its work as
represented, and we will give
long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small
amount of ore without injury. The attention of parties having Cement Gravel is called to this
Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with
record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, 59 & 61 First Street, San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

PERFECTED DOUBLE Economic Quartz Mill.

Attached to each Mill
is an effective
**Automatic Ore
Feeder.**

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of
two heavy castings, the bottoms of which are slightly circular in form, and each provided with
our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of
the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working
parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 9
to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

THE GATES CRUSHER

Is beyond all question the most important improvement that has ever been made in this class of mining machinery. It will do more than twice the work with a given amount of wear than any other Crusher made, besides crushing so much finer that for mining uses, the capacity of the mill is greatly increased. It has the same relative superiority for macadamizing purposes, affording the cheapest and most reliable machine for this use.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents, MINING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

JOSHUA HENDY MACHINE WORKS,

(INCORPORATED SEPTEMBER 29, 1882)

Nos. 39 to 51 Fremont Street,

San Francisco, Cal.

Manufacturers of NEW and Dealers in SECOND-HAND BOILERS, ENGINES, PUMPS and MACHINERY OF EVERY VARIETY.

"SENSIBLE" HORSE POWER HOISTING WHIMS.

These Hoisting Whims are built entirely of iron and steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

ROCK AND ORE CARS.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready to work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We Carry in Stock the Following Sizes, viz.:

NO. 1.--

Capacity with One Horse and Single Line, 800 Pounds, 75 Feet per Minute.

NO. 2.--

Capacity with One Horse and Single Line, 500 Pounds, 125 Feet per Minute.

Weight of Machine, 1200 Pounds. Total Shipping Weight, Including Sweep, Levers and Sheaves, 1400 Pounds.

Concentration of Iron Ore.

Last year John Birkinbine and Thos. A. Edison contributed to the American Institute of Mining Engineers a paper on the above subject, which gave the results of concentrating magnetites in several parts of the Eastern States. In their paper they described the various magnetic machines need for concentrating these ores. Fig. 1 shows the Buchanan separator, which consisted of a pair of rolls and a large horseshoe magnet properly wound (as shown in outline). It was employed in separating magnetite from the fine sea sand from the shores of Long Island sound, and an extensive plant was sent to New Zealand, where the sea sand carries a remarkable amount of finely comminuted magnetite.

A pair of these rolls has lately been operated at the Croton magnetite mines, near Brewsters, N. Y., by the Messrs. Cheever, to prepare concentrates from the waste-piles of lean ore. The ore, a dense magnetite, is reduced by jaw-crushers and Cornish rolls so as to pass through 16-mesh screens.

The Wenstrom magnetic Fig. 2 separator has a stationary field magnet and an armature barrel consisting of a number of soft iron bars, separated from one another by a non-magnetic material. The whole is bound together by non-magnetic end-rings. The bars are on away alternately on the inside to make one bar project only toward the north poles of the magnet and the next only toward the south pole. This gives each succeeding bar opposite magnetism. On each of the four sections of the magnet are wound 15 pounds of copper wire. An Edison dynamo furnishes a current of ten amperes and 33 volts. The ore is fed in the barrel from a hopper. The magnetite adheres to the bars of the barrel and is carried downward past the first delivery chute. Below the machine the bars, departing from the influence of

MAGNETIC MACHINES FOR CONCENTRATING BLACK SAND.

the electro-magnet, which is placed eccentrically, lose their power to hold the particles of magnetic iron-ore and they drop off. The particles of rock in the ore being non-magnetic drop from the barrel almost immediately and fall on the first chute shown in the engraving.

The Conkling magnetic separator is a belt machine of the general form indicated by Fig. 3, which merely shows the principle and not the detail. The ore is fed on a belt and car-

ried along under a series of belts, running at right angles to the first. These cross-belts pass between the magnets and the ore lying on the distributing belt, and may be placed at varying distances from the latter. As the ore, reduced to the proper size, passes along on the distributing belt, the magnetic belts, which may be influenced by magnets of different powers, pick up and carry to one side the magnetic particles of the ore, while the non-magnetic

portion of the gangue is carried off as tailings.

The Edison unipolar non-contact electric separator differs from the forms described in that it has no moving parts. Except such facilities for altering the relative position of the parts as are essential for adjustment in treating different ores, or are required to secure certain results, all parts of the apparatus are fixed. The separator, which is illustrated by Fig. 4, consists simply of a hopper, a magnet and a partition to separate the concentrates and tailings into different receptacles. The illustration shows but one hopper, but in practice the ore can pass on each side of the magnet, thus doubling the capacity. The simplicity of the construction, which is the result of patient and thorough investigation of many different designs and methods, will commend itself.

The ore after being properly crushed and sized is placed in hoppers, from which its discharge is controlled by bars closing slots which extend the length of the hopper. These slots are made adjustable so as to suit the size to which the ore has been reduced. The hoppers are adjusted to appropriate heights above the magnet.

The material falling from the hopper passes the face of the magnet, but does not touch it. The distance of the magnet from the vertical plane of the falling material is so chosen that its attraction causes the magnetic to separate from the non-magnetic particles sufficiently to alter their direction. By reason of the force of gravity, this deflection of the trajectory, while sufficient to draw the magnetic particles away from the non-magnetic, does not draw them against the magnet, but should any ore accumulate on the magnet it can be instantly dropped by breaking the current. The exact distance, however, is maintained so that none can stick to the magnet. Owing to the altered trajectory the magnetic ore falls upon one side of the partition, which is so adjusted as to secure the best result, while the gangue material drops upon the opposite side.

In many ores there are particles of magnetite attached to some non-magnetic material which prevents them being carried over with the concentrates, but cause them to be drawn sufficiently from the vertical to separate them from the tailings, or when the stream of material permits several layers to pass the magnet simultaneously, particles of non-magnetic material may retard the movements of magnetic portions so that they do not pass into the concentrates. In such cases an intermediate grade is collected called the "mugwump," because it is neither concentrates nor tailings. This mugwump may be returned to the hoppers or passed before a second magnet. A series of magnets may be arranged so the concentrates, mugwumps or tails are each subjected, as in other machines herein described, to repeated magnetic influence, thus insuring more perfect separation, and maintaining the capacity which is a strong point of the Edison apparatus. The capacity of a two-face machine is 300 tons per day.

As but ten members of the Academy of Sciences attended the meeting on Monday last, an adjournment was taken for want of business and a quorum.

SILVER MILL, FOR CRUSHING ORES DRY.—See page 93.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Copperopolis.

The New Copper Smelter.

[From Our Own Correspondent.]

The snow and accompanying rain has retarded mining operations throughout the State. Oslaveras county, with Copperopolis included, has come in for its share of "the beautiful." Notwithstanding the uninterrupted storm, operations have been continued right along, while the outdoor work has necessarily been checked. The superintendent, Mr. J. A. Ferson, has found plenty of rainy-day work for all hands. The works of the company are now on so extended a scale that it is but a shift from one job to another on the part of the men, but the results are not the same at present, as the storms put out the fires in the roasting-piles and prevent the completion of the smelter. This smelter is "Lakes" patent blast furnace of the Orford Copper Co. of New York."

The manufacturers claim superiority over other copper smelters by reason of the peculiar construction of the "Orford." This consists mainly in an air-box underneath the hearth, thus saving the making of immense copper hot-toms and consequent expense in removing the same; the greater ease with which the smelter can be regulated, and the increased output. The 43x11-foot furnace has a capacity of 200 tons of ore a day (24 hours), and an average capacity of 125 tons a day, handling the ores of the Union mine at a cost of \$4.75 a ton. The smelter is not an experiment, but is in successful operation at this time at the Orford Copper Works, N. J., Orford Nickel & Copper Works, Capleton, Conn., and the Butte Reduction Works, Montana. The owners of the patents show their faith in their smelter by guaranteeing its successful and profitable operation on ten-per-cent ore. Of course these results are not obtained by the merits of the smelter alone, but are due in good part to the knowledge of the manager in charge.

On this plant Mr. F. F. Hunt, formerly of the Butte Reduction Works, has been placed in charge, and everything goes to show that under him the smelter will do all that is claimed for it.

The smelter will, for the present, be used only as a concentrating plant, making copper matte of 45 per cent, which will be shipped to the Orford Reduction Works in N. J. This smelter can be set up in New York for \$2500. The Copperopolis smelting plant, when complete in all parts, will cost \$15,000 to \$18,000.

All of the ores of the mines carrying less than 10 per cent of copper will be roasted and leached; those over 10 per cent smelted. The smelter and roasting and leaching plant will handle 300 to 400 tons of ore a day, and give employment to an average force of 150 men. Mr. Ferson has kept a force of miners steadily at work in shaft No. 1, sinking the same an additional 140 feet and running levels, everything being pushed as steadily and rapidly as the weather will permit. But for the long siege of "mistiness," the Copperopolis plant would now be in full operation; and Mr. Ferson, together with the owners of the mine, rewarded by a handsome output from the best equipped copper plant in the State.

E. H. SCHAEFFLE.

Murphy, Cal., Jan. 25, '90.

Inspection of Mines.

EDITORS PRESS:—In a late issue of the MINING AND SCIENTIFIC PRESS, I notice an article entitled "Prevention of Mine Accidents." The writer is certainly not well posted when making the assertion that "we have no governmental or State officials to inspect mines and see that proper precautions are taken against mine accidents," unless he refers only to California and Nevada. That all the large coal-producing States have corps of inspectors for the past 15 years is a well-known fact. Of the metalliferous mining States, Michigan has six inspectors in the iron and copper producing counties; Missouri one, whose duty demands of him to inspect the lead and zinc mines of that State; Montana has recently appointed a State Inspector, and Colorado has a State Inspector of Mines and three assistants.

To prove to you that the office is no sinecure, I would state that in the last six months of '89, in my official capacity (Inspector of 3d District of Colorado) I visited and examined into the methods of working over 200 mines. While the majority of the mines were found to be working under intelligent management, and with a due regard for the health and safety of the toilers underground, still many were found in bad shape, and demands upon owners and managers for betterments were made, and have been complied with.

Statistics carefully prepared prove what is not generally known—that there are far more accidents to the number employed in metalliferous mines than in coal mines. A miner injured here, and killed over there, in the aggregate make a list, if compiled annually, that is startling; and the question arises, how can those accidents be prevented? That many so-called accidents are better termed suicides is a fact. For instance, many who are

injured and killed by explosions in our mines, contributed toward the result by acts of their own carelessness. Very few mine managers favor accidents of any kind, but that they do often work their mines without any regard to proper ventilation, and thus compel the workmen to breathe the poisonous gases given off from the strata and from decaying timbers, explosions of powder, candle smoke, and so forth, is a fact also. More miners die from being "leaded" and "miners' consumption," from the lack of pure air, than from all accidents in the mines; and much good in this respect follows the passing of wise inspection laws. The law in this State is in its incipency and does not meet fully the requirements of the mining industry of Colorado. Many valuable sections of the bill introduced were cut out in its passage through the Legislature; but that good will be accomplished by the imperfect bill passed all will readily agree.

GEORGE KISLINGBURY,
Asst. Inspector of Mines.

Silverton, Colorado.

Californians in Antwerp and London.

EDITORS PRESS:—You can hardly realize how happy we are that we are in a land where the English tongue is spoken, and are understood and can understand. For nearly two months we have been where not one in a thousand could communicate to us in an intelligible manner. It has been by either signs, pantomime, demonstrations, exemplification, or broken jargon. We have ridden whole days with intelligent foreigners, through their own country, who, no doubt, were well informed of its history and doings, and all that some of them were able to say in our language was "sheep," "knife," and such words.

We had Gaze's tourist tickets, which saved us a great amount of trouble. Our tickets were mostly printed in English on one side, and the language of the country in which we traveled on the other. The names of the places through which we traveled are neither spelled nor pronounced as we spell and pronounce them, and it is almost impossible to tell when you are at a place where you wish to stop from the guard's pronunciation. All five of us had to frequently consult our map, tickets, and name of the station pretty sharply, before we could fully decide whether to alight from the car. It frequently resulted in sharp and amusing discussions. It seems so good to get where the English language is spoken that we feel we are almost home again.

We staid in Antwerp (Avers) one night. Antwerp is no such city as Brussels—less life, less business, poorer class of buildings, dirty streets, not so well-dressed citizens, and not in such good circumstances, and do not show such thrift. The Grand hotel that we stopped at was three times too large for the amount of business they were doing and seemed to be an elephant on their hands. They charge you so much a day if you take wine at dinner; if not, they charge you a little more for the room. If they cannot make their profits on wine, they will make it up in the room.

When I was paying my bill a temperate Englishman was reading a lesson to the proprietor for his method of doing business. The landlord claimed there was more profit on wine than hoard. I think that was an honest and candid statement. They charge for a common kind of table claret not less than about \$2.50 a gallon, 3 to 3½ francs a bottle. That seems rather dear when it can be bought in California for about 15 cents a gallon by the wholesale.

Antwerp has a fine, large cathedral with lofty and well-shaped spire. The interior is built after the same style as most of those that we have seen—high arched roof supported by large fluted columns. It has some marvelous wood-carving, saintly pictures and numerous crucifixes in all parts of the church.

A good many devotional persons were present to listen to and participate in high mass, which was being repeated by five or six priests in their wonderful tinselled robes.

There is a very good picture gallery here, and, to my notion, some of the best pictures I have seen on this side. They are large, bold and more life-like, and show splendid coloring. Rubens, the great painter, has quite a number of his works here. One of his masterpieces, "The Descent from the Cross," is in the cathedral.

High earthworks and walls are built around the city. The bank of the river next the city is walled up with large cut granite, making a splendid dock for nearly half a mile, covered with iron and glass sheds. They have the largest and best conditioned horses here that I have seen in any country. They are used on trucks to haul freight and coal around the dock. The most degrading thing I saw here was two large young girls, 18 or 20 years old, unloading a car of fruit in baskets and putting them 50 yards away under a shed. A young, stout man was on the car handing the baskets to the girls. I should judge the baskets weighed 50 or 60 pounds. Longshoremen were working all about them on oars and boats. The girls did not seem to mind it more than they would to carry a handful of wood or coal into the house. I do not think the girls were employed at the dock, but came in with the car from the orchard to unload it.

Some 200 yards back and parallel to the dock is a channel half or baron nearly a quarter of a mile long and 200 feet wide, dug out and walled

up with large cut granite for canal-boats, schooners and sloops to load and unload. There are two or three sets of heavy flood-gates that close the water in at high tide and bring the vessels near the top of the dock; otherwise it would be difficult to discharge their cargoes on account of the extreme high and low tide. Coal and mussels seemed to be the chief traffic. I saw several cargoes of the black mussels being unloaded into sacks, harrows and carts, which the women draw around the streets, and when they find a purchaser will stop their cart and open the mussels the same as oysters. The little children around the dock go for them just as ours do for gum. I learn that they will spoil in a few days unless kept in salt water. They seem to be used as a substitute for oysters.

Antwerp is a famous place for making the dogs work, and I must confess that I had but little idea of the amount of work that could be got out of a dog, and the dog enjoy it. I saw three dogs to one cart, and they running and barking as though it was real fun for them. They have a little cart with shafts, and when the master is gone too long with his milk they will lie down and rest.

Most all dogs on the continent are muzzled with leather or wire, and are led when on the streets. They have some of the largest dogs over here I ever saw.

Crossing the Channel.

Thursday was very rainy and windy and we dreaded crossing the channel in the night, as we had to leave at 6 o'clock P. M. The Oolchester was a good-sized, strong vessel, and I believed she would take us over safely even if she did shake us up some. As the sun went down, so did the wind somewhat. The arm of the channel makes up to Antwerp, a distance something like 20 miles, and it was about 12 o'clock before the vessel began to rock us to sleep. I had a good berth and did not pay much attention to her rocking. The ladies did not enjoy the trip very much, and looked pale and restless the next morning.

In England.

We arrived at Harwich the next morning at 5 o'clock, about 90 miles across the English channel. Took train at 6, and arrived in London at 9 o'clock A. M. There had been a good deal of rain of late, and the trees and grass looked green and fresh as spring.

We return to hedge fences and leave most of the tile roofing. We have left the flat country, and now we find it rolling, which is a pleasant relief. We find a good deal of grain and turnips in the fields; some few apple orchards. We see a good class of buildings, and but little timber land. The tall brick chimney is seen all over England and Scotland, and it indicates manufactures and industry.

London appears to be just as large, just as busy and mysterious as she was six weeks ago. I can hardly realize that I am in such a large city—the very financial and business center of the world. There is a market and a price for anything and everything that is capable of moving or having a being.

I had a desire to see the Queen's horses, kept at Buckingham palace, on exhibition between 2 and 4 each day. I had a ticket of admission during the Shah's visit in London, but the horses and men were kept so busy the horses and coaches could not be kept in a condition for exhibition, so visitors were excluded for a few days. Finally, presenting my ticket to a large, well-fed and well kept man with tall hat with rosette, red coat and knee breeches, signed my name in a register-book under a San Francisco man who had just passed the rounds before me.

This red-coated man signaled to a tall, young, fine-looking man in black to show me around, which he did in a gentlemanly and intelligent way.

The horses were kept in a number of stables, and the most I saw in any one stable was 36. These 36 were bays with black points and about 16 hands high, and groomed until they glistened. No two could be picked out but what would make good matches. Another stable contained 10 or 12 bay saddle horses for grooms, servants and outriders.

The large carriage is a marvel of size and workmanship. It takes eight horses to pull it, is 120 years old and took five years to build; two kings and Queen Victoria rode in it to be crowned—Victoria when she was 19. One of the great masters from Italy came over and painted the panels, which are said to be unsurpassed in artistic skill and seem quite fresh now. The carriage part rests on thorough braces, and is so nicely poised that a person with one hand can rock it with ease.

There is a wide, long inclosure with tanhark floor to exercise the horses on in bad weather. I have not seen a haly horse, mule or dog, or a runaway on this side. I have seen horses stuck with overloads, but they would pull every time they were called on. I have seen horse cars operated in every city that we have visited except Venice and have not seen one car run off the track. The upper side of the rail to a street car is divided by a groove running the entire length, the wheel resting on the larger part of the rail, while the flange or rim of the wheel runs in the groove, the smaller part of the rail being on the inside. By that means the car never runs off the track. The track lies level with the street and carriages pass over it without damage or any perceptible difference. Most every city has some little difference in the mode of collecting fares. The hell-

punch method seems to be used as much as any kind. Most every one gives a small card as receipt, with the amount paid printed on it.

I was in London during the great dock strike and saw them parade the streets several times with their banners, bands of music, bundles of bones tied to sticks suspended in the air, and a blockade of London bridge, so that the traffic of teams and buses was suspended for a long time. When you take into consideration the thousands of teams that pass over London bridge every hour, you can judge something of the distance the blockade extended on either side.

I was sitting on the top of a "bus" on the south side of the Thames looking on as patiently as my nerves would admit during the passage of this throng. The men seemed well dressed, and looked and acted like intelligent men, and made but little disturbance for such a large gathering.

Quite a body of soldiers followed them up, to quell disturbance, I presume. As near as I could learn, I concluded the strikers were justified in making demands for more pay for their work.

Hundreds of vessels were in and coming all the time with cargoes on either side of the river and at anchor in the stream, which could not be unloaded for want of labor. It appeared the dock-owners have invested so much in the docks that they do not receive the dividends they desire and were trying to make up from labor.

We left London at 2 P. M. for Liverpool via London & Northwestern road, a distance of about 200 miles, and arrived at 6:23 P. M., 4 hours and 23 minutes, with three stops. It was good, healthy riding when a man wants to get a change of fresh air.

I did not suppose there was so much grain grown in England. Some of it lay flat on the ground and grass growing up through it. The larger proportion was in shocks, but a good deal was bound, but still lying on the ground. It has been very wet since harvesting began, and farmers have not been able to put their grain in the stack yet. The fields looked green and beautiful. I think they sow olive with the grain, as I see it coming up in fine style in all the grain-fields. I should think the grain was wheat, barley and oats, but we went so fast through the country it was impossible to tell.

On Saturday we took a run over to Dublin, via Holyhead, an extreme point that makes out from Wales. It takes a little over four hours from Liverpool to Holyhead on the cars, and about the same time on the boat to Dublin. The weather was fine and water smooth for the Irish Channel. Dublin is quite a business place, and a vast amount of money has been spent on the seawalls, lighthouses and walling up the banks of the River Liffey for a long distance through the city. She has five docks, where they close the vessels in at high tide the same as Liverpool.

In the streets of Dublin are several statues and columns of some of Ireland's celebrated men. The old Parliament House from the outside looks like a Roman amphitheater. It is used now for the Bank of Ireland. For some distance around this square every other building seems to be occupied as an insurance office.

I thought I had seen poor people enough in Liverpool, bare-headed and bare-footed women and children, but this surpasses everything seen before. How a city will allow its unfortunates to walk its streets in such abominable filth and rage I cannot conceive. Perhaps these few are an exception, for most of the people were well dressed and looked like industrious people.

I should never expect that I was treading on the green turf of old Ireland, or in the sound of the twang of Erin's harp, by the brogue or pronunciation of its citizens. I did not bear as much brogue as I would in one day in Sacramento.

The fashionable or most used conveyance here is the jaunting car, or "outside." It is built over two small, stout wheels. Four persons sit over the wheels, with backs to each other, facing outward; the other two with backs to each other, one toward the horse and the other to the rear. They ride very easily and every stranger wishes to try one. I became quite interested in the city and regretted very much that we could not take a little more time to look around here and through the country. We went back on Monday in the same boat, the Rose. The weather was not very pleasant; cold wind and fog, and a little motion to the boat, which made some of the ladies look over the side of the boat and make up awful faces to some imaginary demon down below.

We performed the feat of going around the river Mersey the same as you would go around a log. We first went under it in the cars through the tunnel, then we braced ourselves up a little with some tea and lunch at Birkenhead and then returned on the ferry-boat. It took about three minutes to pass through. It is a double track arched over with brick. Ferry-boats and ships passed over our heads as frequent as horse-cars in the streets. A great deal of walking has to be done at either end to get down or up from the cars. The fog is so dark to-day that I had to move up close to the window to see to write, and the merchants on the other side of the street had to light their gas. I suppose this is what is called the black fog of London. It is so near a rain that about half of the people are carrying umbrellas.

This is the last letter I shall send to the

PRESS from this side. If they have served to amuse or instruct its readers, I shall feel fully compensated for my trouble. These letters have been written more as a matter of duty than anything else. If any of my fellow-Grangers should make a similar tour, I should most certainly expect them to give their impressions of the country and people to their fellow-members left behind.

I hardly know what disagreeable things there may be in store for me arising from writing these letters. A part of one of my letters was published in a Glasgow paper and cut out and underlined and sent to a friend of mine for me to see.

The press and my friends have noticed me, and why cannot I take the same consolation that a man did when he boasted to his companion that Gen. Jackson had spoken to him during the procession to his inauguration. One asked him what the General said to him. The General told him if he did not get out of his way he would allow him to sit on the toe of his boot standing up.

We expect by to-morrow night at this time the how of the good ship City of Rome will be

The Olive in California.

There is so great interest at present in the growth of the olive in this State, because of the notable success attained by the pioneers in this specialty in California, that the views which we present on this page will be welcome to many readers. When we speak of our pioneers in olive culture we do not mean the *padres*, though they were pioneers *par excellence*, and not only demonstrated the success of the olive on this coast, but secured in some way a variety which now bears the name of their establishments and does not yet yield the palm of excellence to other later-coming varieties from Europe, although it may have to share the honor with them. Though the *padres* did grandly under their conditions, it remained for another race of pioneers, about a century later, to bring olive culture upon its present basis commercially and industrially. While we recognize Cooper of Santa Barbara with his characteristic care in investigation and liberality in investment, and the Kimballs

newer plantations. It is the practice to plant vines and peaches between the rows of olives, with the idea of giving the latter the whole ground when they need it. The appliances for oil and wine making on the farm are well adapted to the purposes, and the establishment has a reputation far and near for enterprise and intelligence in its management and development.

New Mexican Camps.

Cooney Camp is in the southwestern portion of Socorro county and has a number of valuable mines, but there is a need of mills to reduce the low-grade, free-milling ores. Klagston is a bustling mining-camp about seven years old. From the Lady Franklin mine, one of the half-dozen mines on the hill, over a million and a half of silver dollars have been taken, with many thousands in gold out of mere prospect-holes. From the Comstock, adjoining, while running a tunnel to prospect the claim, a chamber yielding \$350,000 was found. Immense bodies of low-grade ore, and much high-grade,

being milled, yield an amount of treasure exceeding that which has already made the property famous. The low-grade ores have almost been valueless, and it was for a long time a positive loss to attempt to treat them. This defect has been remedied, and Mr. Bremen is now saving 90 per cent of the assay value of the ores, which leaves a fine balance to the credit of the mine after deducting the expense of mining, transportation and milling.

The Monarch, at Lone Mountain, by reason of the extended and continued development, is rated as a leading property and belongs to Frank Bisbee & Co. Monthly shipments are made, the average grade of the year's shipments being considerably over \$100 per ton.

Black Hawk district has a number of producers; among them the Blue Bell, Alhambra, Rose, Hobson group, Red Cloud, Good Hope, Horn Silver and Silver Klag.

East camp, about four miles in an easterly direction from Carlisle, is rapidly coming to the front as a producer. The Nagget mine is proving to be a first-class mine. Cook's Peak has been coming to the front rapidly during

VIEWS ON THE QUITO OLIVE AND VINE FARM, NEAR LOS GATOS, IN SANTA CLARA COUNTY.

headed toward the West, and may she not stop until she lands in New York. D. FLINT.

GEN. BIDWELL IS REMINISCENT.—"I have no recollection during a residence of nearly 50 years in California," said Gen. Bidwell, "of any rainy seasons equalling the present one to date for rainfall, snow and amount of cold weather, with the possible exception of 1841-42 and 1849-50. The highest water I ever saw in the Feather river was on April 1, 1853. I was in Marysville at the time, and the water then stood about three feet on the present site of the Western hotel, at that time the highest ground in the city. This was before the era of hydraulic mining, and placer mining had not affected the stream to amount to anything." —Chico Enterprise.

A METAL BILL.—A bill introduced by Representative Thompson of Ohio provides that copper, lead and nickel may be imported in ores, bars, etc., for refining, free of duty, provided that an amount of copper, lead or nickel equivalent to that imported shall be exported within six months in a refined state.

CONGRESSMAN MORROW has introduced a bill to relieve the Union Iron Works of the penalty incurred by the cruiser Charleston not coming up to the required 5000-horse power. The penalty amounts to over \$33,000.

of San Diego, with their well-known seamen and energy, as earliest claiming public attention by their achievements with the olive, we come next to El Quito in Santa Clara county, as a leading olive-oil producing establishment. There are, of course, olive plantations away from the Missions older than any we have named, but their owners did not regularly use their fruit as a commercial product.

The pictures upon this page give the reader a partial view of the olive plantation upon El Quito olive and vine farm, the property of E. E. Goodrich, situated in Santa Clara county, about 3½ miles from Los Gatos and eight miles from San Jose. This farm, comprising about 80 acres, came into the possession of Mr. Goodrich in 1882. There was at that time a number of old olive trees growing on the place. A view in the old orchard is given in the lower right-hand corner, and upon the left is another old tree standing in the midst of newly-planted ones. This tree was 16 years old at the time the photograph was taken. Mr. Goodrich has been obliged to renovate his older plantation; the trees set at 16 feet apart soon interfered with each other's progress and were thinned by removing alternate ones. Recently Mr. Goodrich has been doing much grafting in introducing new varieties, and has thus given new heads to many old trunks.

The landscape at the top of the picture gives something of a general idea of the lay of the ground on El Quito farm and the extent of the

are found on Cave and Garfield creeks, at McCann's camp, around Danville, and the Ingersoll group. Rich flat and well-defined vein are found on nearly every mountain-side. The North Peroha crosses the belt and exposes mineral all the way for the five miles of its course. From the Virginia group down about midway is the town of North Peroha, immediately southeast of which are the Eclipse and Charm group of mines. At Gold Hill there are some 50 gold and as many silver ledges, and the great need of the camp is a custom mill, that will save the ores to within 85 per cent, and we guarantee the founder a fortune in a few years. It would impart a new impetus to the miners and inspire their hearts with renewed energy.

Chloride mining district, as applied to the "flat" and surrounding hills, is distinctively appropriate, owing to the fact that a major portion of the values contained in the mineral products of the Bremen group, Providencia and other properties, consists largely of chlorides of silver. From the date of discovery up to date Chloride flat has been a constant producer, and the output from the Bremen properties is but little short of three and a half millions of dollars. The ore, as a rule, does not lie deep, and hence the cost of mining has not been so expensive as in less favored localities, and it is within the bounds of reason to assert that the developments of the past year in the Bremen mining estate will undoubtedly, on

the past two years as a producer and is now in shape to make a fine record for itself and the county. The ore is usually of a lead character, but averaging from \$60 to \$90 per ton in silver. —Silver City Enterprise.

STUDENTS OF MINERALOGY.—The attention of the secretary of the State Mining Bureau has been occupied for several days past in explaining the wonders of the mineral world to the young ladies of the High School. The teachers have recommended the study of mineralogy, and the young ladies are availing themselves of the splendid collection at the museum of the Bureau.

DOWN A SHAFT.—On the 30th ult., during the excitement caused by a fire in the hoisting works of the Quaker City mine at Chili Gulch, Edward Hanford, a carman, ran his car into the shaft, and was instantly killed by falling with it. Four men who were working at the bottom of the shaft escaped being crushed to death by the car becoming wedged in and stopping a short distance above them.

THE discovery of gold on the San Marcos creek, a few miles northwest of Paso Robles, continues to create considerable excitement. Prospectors are getting good returns panning out in the creek bottom and the neighboring gulches, and in two cases promising ledges have been uncovered.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—*Ledger*, Feb. 1: The water has been very troublesome at this mine since the last storm. For several days the water-tank was kept going steadily day and night, and still the water gained on them. They hoisted at the rate of 130,000 gallons per day. In an ordinary season 50,000 gallons is considered an unusual flow. This constant activity of the water bucket has necessitated hanging up 20 stamps of the mill. The other 20 are kept going on rock hoisted from the other shaft. The flow of water has materially decreased the last few days, and if the weather continues fine everything will soon be running full blast.

KEYSTONE.—At this mine water is being hoisted out of both shafts; indeed nothing else is being done except taking out water, and still it is all they can do to keep the water from gaining. It is reported that good rock has been found on the 1400-foot level, in the drift running south. How much of a ledge this is cannot be known as yet. The prospecting operations were stopped to devote all energies to keeping the water out. The woodpile is getting low; enough to run till March; the outlook is that they will be run extremely close.

MISCELLANEOUS.—The pipe which carries water to the Drytown Consolidated mine was carried away by the flood, and brought the operations to a standstill for several days. The McKenzie Bros. mill near Irishtown has been started again with water-power. The Gover mill has been kept running with 20 stamps. The water is troublesome, but they have been able to handle it so far without hanging up the stamps. At the Kennedy they are hoisting 175,000 gallons of water per day. They are well fixed to handle water, and manage to keep 20 stamps of the mill going steadily. Supt. Tibbitts reports that the ten-stamp mill of the Sutter creek mine was brought to a standstill this week on account of heavy landslides occurring on the Amador canal. Stopping has been in order above tunnel level. Ore-bin now full. Mill will resume crushing Sunday.

MINES AROUND IRISHTOWN.—*GARDINER.*—Cor. Amador *Ledger*: The Gardiner mine has again resumed operations. Since January 15th the weather has been such as to necessitate stoppage for a few days. Last Monday the old hands resumed work. The intention is to crosscut the ledge, to ascertain its full extent. Indications point to the existence of one of the finest ledges in Amador county. The tunnel is running between two ledges, namely, the Faugh and Union. On the hanging-wall there is a fine-looking ledge, and on the footwall is the Union, with indications as promising as could be wished. Prospects taken from this ledge have yielded satisfactory results. With the return of good weather, there is every reason to look for steady, progressive work under the supervision of James Gleason.

MCKENZIE.—Situated on the creek, below the Gardiner, is the McKenzie mine, one of the most favorably located in this vicinity. Owing to inclement weather, it was brought to a standstill for want of wood. The mill, however, has again started with water-power. There is rock enough to keep the stamps going for 30 days, and it is said to be rich enough to clear off all incumbrances on the property, as well as pay running expenses for some time to come.

REED & MCKAY.—This mine has been at a standstill for some time, on account of a controversy between the owners; but there are hopes of a speedy settlement. Mr. Reed expects to commence operations as soon as the weather will permit.

THE REED & ASKEY is about 1 1/4 miles from Irishtown. Some of the richest rock ever seen in the county has been extracted from this mine. Owing to bad communication between mine and mill, everything is idle until the roads become passable for teams.

LAVERZO.—The rock assays from \$15 to \$20 per ton, with an output of from 25 to 30 tons per day. With a little capital to provide easy access to the mill, this ought to develop into one of the best paying properties hereabout.

LAST CHANCE.—This mine is owned by Messrs. Dwyer, Conlon and Fahey, and is an extension of the Going mine. During the last few days an excellent looking body of ore has been opened. The ledge can be traced for 600 or 700 feet from the tunnel, and shows a fair prospect throughout. The writer saw a test made from samples from the claim, yielding rich-looking sulphurets and a good showing in free gold. The property was discovered by Patrick Fahey, one of the oldest miners in the county, and formerly foreman of the Going mine.

Butte.

BIG BEND WILL BE WORKED.—*Oroville Mercury*, Feb. 1: Supt. Beaton of the Big Bend mine has returned from Arizona, where he went to meet Dr. R. V. Pierce, president of the mine. Mr. Beaton states that just as soon as the river goes down sufficiently, a force of 100 men will be put into the mine and worked as long as the season will permit. The splendid results of last season's work with a small force has greatly encouraged Dr. Pierce, and he hopes that this season's work will prove profitable in proportion to the increase of men.

NUCKET.—Geo. Carr of Miner's Ranch came to town yesterday and brought a nugget of gold picked up in a ravine near that place by a miner. It was pure gold, about the size of an apricot, and he sold it in the bank of Rideout, Smith & Co. for \$45.20. The rain had uncovered it, and the lucky man came along to find it. Such things happen very frequently along the ravines leading to the Feather river.

THE GOLDEN GATE MINE.—Work has been going on at the Golden Gate mine, near Oroville, all winter. "We are paving the way for an early commencement of active operations at the mine in the spring," said Major Frank McLaughlin, the energetic manager. "In a few months a large force of men will be set to work preparing and gathering the rock for the head-dam, and when this work is fairly started the gigantic flume will be again built. Surveyor McGann has just completed a survey of the route for the immense flume. It will be constructed with less bends and angles than the one we had last season; will be much stronger and carry 50 per cent more water. I have contracted with the Sissons Lumber Co. for all the lumber we shall use. Yes,

we are ready for an early start. Our plan of operation is laid out, and we know just exactly what we can do; that is, so far as the engineering skill of man is concerned. But we don't pretend to be able to handle the elements; that is beyond the power of man. But we hope for a good season, so that we can once more see the bottom of the Feather river; and not only see its wealth laid before us, but liberally help ourselves from its treasures of gold."

Calaveras.

WORK FOR THE DEAD BODIES.—*Angels Echo*: We have given, and shall continue to give, the public some idea each week of the work going on in the Utica mine for the purpose of getting out the dead bodies buried beneath the cave. A large drift is being run in the south end of the mine, in the direction of where the dead bodies are supposed to be. The work is being prosecuted as rapidly as possible, under the unfavorable circumstances, and no stone will be left unturned to exhumate the bodies at the earliest possible moment. The management seems every bit as much concerned and as anxious to get the poor fellows out and give them a Christian burial as the public, or even their nearest friends and relatives. Since the above was in type one of the dead bodies has been unearthed and brought to the surface. The body is supposed to be that of James Casey.

El Dorado.

SLATE.—*Placerville Observer*, Feb. 4: The Strahle Slate Co. are shipping a carload of slate from the depot here. The railroad company and the slate quarry companies have made arrangements for the construction of large sheds on the vacant ground across the track, for use in shipping slate. The industry has grown to such proportions as to necessitate special arrangements for the speedy handling of slate cargoes.

PELTON WHEELS.—Several large Pelton wheels have been sent down to the McNulty mine recently, and to-day D. C. Wickham goes down to put them in place and reconstruct the workings at the mine.

Lake.

PROSPECTS.—*Avalanche*, Feb. 1: As yet Lake county has no mines except those for quicksilver, but from the prospecting which has been done and is being done we are led to believe that ere another year passes, Lake county will have some veritable silver and gold mines. Judge Hudson and some others have discovered a ledge west of town, somewhere in the vicinity of the Watenberger place, that pans out from the cropping \$2 to \$3 of precious metal per ton, and this from croppings indicates that when the ledge is traced into solid walls and becomes more compact, it will produce paying ore. They have organized a Co. and intend to work and prove their prospect as soon as circumstances will admit. On the other side of the lake, Lil Boggs et al have been doing some work between showers, and they also have first-class indications. They have had some ore worked which paid from \$3 to \$6 per ton, and this too from near the surface. There is not much doubt but this prospect will lead to paying ore.

Nevada.

NORTH STAR MINE.—*Grass Valley Union*, Jan. 30: Underground work has been resumed at the North Star mine, and the pumps and mill are being run by water-power. Several of the lower levels of the mine have filled with water, and extra pumps are to be put in to relieve them.

NORTH STAR.—*Grass Valley Tidings*: A report of the North Star Co.'s operations will be ready for publication shortly. Two dividends, each of \$50,000, were paid in 1889. Development work is going on steadily. The 1900-foot level is being extended, and sinking for the 2000-foot level has been commenced. The superintendent's latest reports show that 35 stamps of the company's mill are crushing quartz and five are on "stope waste." It seems that the stopes in the upper levels are gone over, and the rock which in years past was thrown back as waste is now being taken out and milled at a profit. Mr. Hague says that this waste will yield on an average from \$3 to \$4 per ton, and it costs about \$1.50 per ton to raise and mill it.

EMPIRE MINE.—*Grass Valley Union*, Feb. 1: The Empire mine is now receiving 150 inches of water from the South Yuba reservoir which enables the water in the mine to be handled by water-power. The Empire, like all the other mines, is receiving much sewage water, and in addition to running the pumps it has been found necessary to resort to bailing to prevent the water filling the lower levels. This is being done successfully now, and when more water is received, which is expected in a few days with the continuance of the present mild weather, there will be no difficulty in handling the water. No underground work is yet being done in the mine.

NORTH STAR.—The three lower levels of the North Star mine have been filled with water, on account of the seepage, and no work can be done below the 17th level for the present. An extra 10 and 8-inch pump is to be put in to get rid of surplus water. The mine is now receiving the hence fit of 350 inches of water from the Greenhorn ditch for water-power and has no further occasion to use steam.

Placer.

JAKE NEFF'S BONANZA.—*Herald*: About two years ago Jacob Neff and ex-Governor Perkins purchased the Church mine at El Dorado, county of the same name, and not long ago equipped it with a complete and adequate hoisting plant, subsequently giving the shaft depth. Lately, at the 500-foot level, a 22-foot ledge was tapped. It is stated that the rock is rich, and that from the outlook the property promises to be a bonanza.

THE NEVERSWEAT MINE is one of the group of Ophir mines, and situated on Duncan Hill. There has never been much said about this mine, as the owner prefers to go along his own way, and does not court notoriety. The ledge is well developed, and of sufficient width to be easily and profitably worked. The rock shows gold, and from tests that have been made, there is no doubt of its richness. The shaft is now down several feet, and the owner feels justified in sinking deeper as soon as the water will permit.

EMPIRE.—F. C. Halstead of Yankee Jims will start up the Empire mine, near Duncan Hill, about the 15th of this month.

CALIFORNIA IRON AND STEEL CO.—*Grass Valley Union*, Feb. 5: The California Iron and Steel Co., whose furnace is at Hotelling, Placer county, has been involved in litigation for several years, but

negotiations have recently been entered upon which it is thought will end in a satisfactory settlement. The company as a corporation is impecunious, although owning much property in Placer and Nevada counties, but its principal stockholders, George W. Gibbs, Egbert Judson and A. P. Hotelling, are wealthy men, and against them individually has a suit been pending to meet certain liabilities of the company. They have signified a willingness to make terms, and hence legal proceedings against them have been suspended.

San Bernardino.

MINERAL PROSPECTS.—*San Bernardino Times-Index*, Feb. 1: On Saturday evening last our reporter called upon J. H. Crossman, a member of the State Mineralogist's corps, who was sent to this county to examine and report upon its mineral deposits. The reporter asked the gentleman what he thought of the mineral resources of the county from the examinations that he had made during the past two months. "I am more than pleased with the country as I have found it, and I have seen some of the largest ore bodies that I believe exist in the world. In the Morongo district at the Black Hawk mines there are immense bodies of rich gold ore, and an English company is now preparing to erect a 20-stamp mill. The Oro Grande mountains contain immense deposits of rebellious ores, but at present they are not worth taking out, as the cost of fuel is too great, but when the Utah Southern comes through (and I know for a fact that it will) smelters will undoubtedly be built at Oro Grande or San Bernardino on a large scale, and then all of this ore will be worked, and millions of dollars taken out. The galena of these mountains can all be profitably used when smelters are erected. In the Ord district there are immense bodies of copper and gold-bearing veins extending through the entire mountain, and these mines, as above stated, only await the arrival of cheap fuel before being worked. San Bernardino county and a portion of Inyo, which I have visited on this trip, is the greatest mineral country that I have ever examined, and I believe that it is the greatest mineral-producing country in the world. These desert regions cannot be traversed in the summer and work must be done in the winter and spring months. All that is required to make this one of the richest and most populous regions in the United States, whose supplies will be drawn from commercial and mining centers and more favored agricultural regions, is a railroad, and this much-needed want will soon be at your doors. The Mojave desert contains large deposits of gold, silver, borax, soda, copper, salt and other minerals, and when silver reaches 100 cents, this section will become very populous. Utah has the fuel that we want, and when the iron horse comes across that desert with coal that can be laid down here for \$5 per ton, a million dollars worth of smelting works will be erected in your city, and thousands of dollars will be put into circulation daily, for then the miner with a small grub stake can go to work on his mine, take out a few tons of ore, sell it to the smelter for cash for its assay value, and go back to his work and develop his mine, the ore in the same paying all expenses. The magnetic iron deposit in the Ord district is an immense one, and so powerful is it that it ruined my watch while passing over it. When your fuel problem is solved, Resting Springs will contain a population of 150,000 operatives."

San Diego.

BANNER.—*Julian Sentinel*, Feb. 1: The Bell and Walker mine is showing up fine and the boys are happy. Within the last two months only four millists have been located in Banner, and more in view. Lane and Smith of the Cincinnati Belle mine are expected back to resume operations.

Sierra.

DAMAGE AT PIKE CITY.—*Transcript*, Feb. 2: It is reported that the snow falling in the late storm did much damage at Pike City. The hoisting works of the Alaska mine were broken—how badly is not stated—and 2000 feet of the tramway shed went down. Several buildings in the neighborhood were broken.

WORK STOPPED.—*Mountain Messenger*, Jan. 25: Work in all the mining claims in this section has been suspended by the storm.

YUBA CO.—*Grass Valley Union*, Feb. 1: P. Campbell was up from Smartsville yesterday. He said drift-mining had not been interfered with by the storms, and that the snow did not reach Smartsville. Smartsville is situated in the semitropics, where the best of oranges are raised.

NEVADA.

Washoe District.

OPHIR.—By Telegraph, Feb. 3: On the 1300-foot level from the end of the east crosscut from the shaft station a south drift is advanced 313 feet from the end of the east crosscut, 316 feet from the shaft station. Its face is in porphyry, mixed with quartz, showing value. No work was done last week.

CON. CAL. AND VIRGINIA.—On the 1650-foot level repairs are in progress to the raise above the end of the east crosscut from the end of the north drift from the winze sunk 60 feet below the end of the south drift. The snow blockade on the Virginia & Truckee Railroad has caused a necessary reduction in the force of miners, as it was impossible to ship ore to the mills or bring wood to the mine. We have on hand in the assay office bullion valued at \$14,476, and enough more at the Morgan mill to make an aggregate of about \$32,000.

CROWN POINT.—Ore shipments will be resumed next week.

BELCHER.—The 850-foot level east crosscut continues in porphyry. **SEGREGATED BELCHER.**—Ore bunches are still showing in the 1200-foot level drift from the winze. The 1000-foot level east crosscut is in low-grade quartz.

SILVER HILL.—The usual progress has been made in the 160 and 260-foot level explorations. **JUSTICE.**—The mill is crushing the usual amount and quality of ore.

ALTA.—The mill is again in full operation, crushing the usual amount of ore. **SAVAGE.**—A large area of ore is stripped ready for extraction, and exploratory work is in progress as usual.

HALE & NORCROSS.—The usual exploratory work is in progress, and ore extraction will be resumed as soon as it can be got to the Nevada mill.

CHOLLAR.—The Nevada mill stamps are temporarily hung up, but the usual exploratory force is

employed in the explorations above the 350-foot level.

Floche District.

THE RAYMOND DEEP WINZE.—*Pioche Record*, Jan. 28: On Sunday last the large pump, for ten years under water at the 14th level, was uncovered, and found to be in almost perfect condition. The valves had been set wrong and that no doubt was the immediate cause of the failure of this pump to drain the winze when formerly working. When the pump had been cleaned and the valves set as they were made for work, the compressed air was turned on, and pumping commenced with such force that the old pipes leading from the 14th to the 13th level could not carry the volume of water sent up, and burst under the pressure. This defect has been remedied, and yesterday morning the water had been lowered to a point 15 feet below the 14th level.

Tuscarora District.

NAVAJO.—By Telegraph, Feb. 1: The upraise from the south drift on the 150-foot level is extended 8 feet. No. 2 crosscut from the south drift on the 350-foot level is extended 24 feet.

NEVADA QUEEN.—The north gangway from the 600-foot station of the North Belle Isle shaft has been extended 23 feet. The face of the drift is in a softer formation.

BELLE ISLE.—The crosscut from the north gangway, near the south line on the 250-foot level, is extended 21 feet. The west crosscut from the north gangway, 350-foot level, has been extended 12 feet. The rock is extremely hard.

NORTH COMMONWEALTH.—On the first level the north drift from No. 1 east crosscut has been extended 16 feet. The face continues to show high-grade ore. On the second level the joint crosscut is extended 17 feet, and has cut into the vein, face being in low-grade ore, assaying from \$33 to \$108 per ton.

NORTH BELLE ISLE.—The south drift from station C crosscut on the 300-foot level is advanced 19 feet. The south intermediate drift from No. 3 chute above the 300-foot level is extended 7 feet. The ore continues in size and quality about the same. The north gangway on the 600-foot level is extended 23 feet. The rock in the face is softer.

GRAND PRIZE.—The 400-foot level west drift from the north crosscut is extended 10 feet. The north crosscut is extended 7 feet. The drift from the bottom of the winze in the south drift is extended 14 feet. The 500-foot level north crosscut is extended 26 feet, and has cut north lateral vein No. 2, showing stringers of good ore. The face of the west drift from the north crosscut is advanced 21 feet without change.

DEL MONTE.—On the first level the north drift from No. 1 east crosscut is extended 13 feet, exposing fine ore. On the second level the joint east crosscut has been extended 17 feet, the face being all in low-grade ore. We will have to go about 25 feet to reach the ore body opened by the first level. On the third level No. 1 north drift from the east crosscut has been extended 12 feet, and continues to look well.

COMMONWEALTH.—On the first level the east drift from No. 1 north drift is extended 10 feet; the ore continues to show well as the drift is advanced. The west drift from the same point is advanced 5 feet, and chutes are being put in preparatory to stopping. No. 3 upraise from the Dolan drift has been extended upward 9 feet, developing fine ore. The north drift from No. 5 chute has been advanced 11 feet; it has about 30 feet yet to go to the North Commonwealth line. There is very high-grade ore being opened up by this drift. On the third level stopes are being opened and are looking well. Very little work is being done on this except to open the stopes ready to extract ore. On the fourth level the north gangway has been advanced 11 feet. We have had to timber 75 feet, which has retarded the work somewhat. The stopes in the different parts of the mine are looking as well as at any time heretofore. They have yielded 125 cars of ore per day, which has been sent to the mill and concentrating plant. The average pulp assay for the week was \$251.83 per ton. Bullion shipped to the secretary was valued at \$37,898.93. Crude bullion is on hand worth about \$12,000. The concentrator crushed 525 tons, the assay value being \$17.04 per ton. The average concentrate assay was \$247 per ton. The mill is running nicely and doing good work.

ARIZONA.

SHIPPING ORE.—*Prescott Courier*, Jan. 28: Frank Kuhne has a big force of men taking shipping ore from the Belle mine, Walker district. Joe Chambers makes an occasional run with the mill in said district. Snow has been too deep for constant running. N. L. Griffin and other owners of mines keep taking out ore. Paul Johns, one of the lessees of the Cococin mine, arrived in town Saturday. His partners are taking out ore. Jas. O'Hara, just from Martinez district, says the Congress 20-stamp mill is pounding out plenty of gold. The mine is yielding well. Owners of other mines in the district are developing them. The superintendent of the Black Horse mine is having new machinery put in place and will give the mine a thorough prospecting. The company that owns the mine is very wealthy. Quartz Mountain mill is crushing good ore. The gold is shipped to Kansas City. The Hillside mine is not shipping ore just now. Road's too muddy. Owners and lessees expect to ship \$500,000 worth of ore next spring and summer. Placer miners of Weaver, Hassayampa, Walker, Big Bug and Black Canyon district, have, during the past month, shipped \$20,000 worth to Prescott and other places. Miners of this section are hoping that Mr. Williams, manager for Mr. Dodge and his partners, will, in the spring, put up and run regular reduction works, and save to this section the money that is now paid to foreign smelters for working our richest ores.

DISTRICTS AROUND PRESCOTT.—*Courier*, Feb. 1: Mr. Giroux, Supt. for W. A. Clark, is preparing for a vigorous spring and summer's campaign in United Verde. His smelters are in first-rate condition; mines filled with rich ore. The district has a great many veins which carry gold, silver and copper; is about 25 miles northwest of Prescott. Wood, water and grass are abundant. Cherry Creek district is near by. Its principal mines are the Etta and Mocking Bird. Both have mills and have paid well in gold. Ore is coming out of the Mocking Bird. The Etta mill is being put in good order. Owners of the Wire Gold mill and mine, near Squaw

Peak, are preparing to start their mill. Miners of Ash Creek district are not making much of a stir. They have good mines and should work them. All is quiet in Agua Fria district, but its neighbor, Big Bug, is moving along in fine style under the able management of Mr. J. J. Williams, who understands every twist and turn of mining and whose management cannot be improved on. The district has a great many mines of gold, silver and copper; has wood, water, grass and a fine working climate. It has, also, a great deal of gold in gravel claims. Further south and east is Black Canyon district, in which there are such good mines as the Beaver, Mesa, Iconoclast and Valencianna. There is not a mill in this district. Miners work their ores by arrastra process, or ship it away. Still further south is Tip Top, famous for its rich silver ores, some of which have paid thousands of dollars to the ton. Castle Creek district adjoins Tip Top on the west. It has a mill and several good mines. Coming north toward Prescott, Bradshaw district, with its four mills and ever so many mines; the Peck, Turkey Creek, Hassayampa, Groom, Walker and Slate Creek districts, are passed through. Active mining and milling are being conducted in all of them. Still west are the districts of Walnut Grove, Weaver, Martinez, Eureka, Harqua-Hala and others, whose quartz and placer mines have paid, are yet paying and will continue to pay for hundreds of years to come. These districts, with Silver Mountain, cover a country 80 by 100 miles long by about 60 wide, in the heart of Arizona. There are other mineral regions to the north, the south, the east and the west of it, but none so large. So Yavapai county may be said to lead all of her sisters in the number of her mines, as well as in timber, grazing, etc. The other great mineral counties are Graham, Gila, Cochise, Pima, Pinal, Maricopa, Yuma and Mohave. Apache county has not, as yet, been prospected to any great extent, but it is known that she is rich in coal. To work our mines successfully, and so develop other interests, we must have more people and capital, more railroad facilities, general quartz reduction works at proper places. These, with reservoirs for the storage of water, would soon make of this struggling Territory a great State.

STOCKTON HILL.—Mohave *Miner*, Feb. 1: Jas. Orr is down from Stockton Hill with a carload of high-grade ore from the Black and Tan mine, which is being treated by the Kingman Sampling Company. John K. Mackenzie has a bond on the Cincinnati mine owned by W. H. Hardy and has a force of men at work developing it. A good many thousands dollars have been taken from the working of the Cincinnati, and it will yield many more. C. H. Park has purchased the interest of A. J. Coon in the Sabbath Bell mine at Mineral Park, paying \$2000 therefor. There is now considerable good ore in sight in the mine, and it seems probable that it will be as good as any claim in that place.

IMPORTANT MINING SALE.—Wilcox *Southwestern Stockman*, Jan. 30: The sale of a valuable group of lead and silver mines located in Aravaipa canyon, and owned by John P. Harr, Charles White, the Dunlap Bros., W. C. Bridwell, Charles McGary, Tom Horn, Charles Cunningham and George Zeigler, was closed early this week, and a large per cent of the purchase-money was paid the above-named gentlemen on Monday. The total amount to be paid is about \$40,000. The purchasers, Messrs. J. W. Goddard of New York, and John Heard, Jr., of Boston, left for their homes on Monday night, but will return here in the course of a few weeks. They will organize and incorporate a company, to be known as "The Aravaipa Min. Co.," under the laws of the State of New York. Dr. Alex. Trippe of Globe, one of the most thorough and experienced mining men in the West, is to be general manager of the new company, which is a guarantee that operations will be conducted in a practical manner. Before active operations can be commenced on the mines, several roads will have to be built, and this work will first claim the doctor's attention. A large smelter is to be constructed near the mines, work on which will begin in a few months. Mr. Goddard, one of the purchasers of the mines, is a gentleman of great wealth. Wilcox will be greatly benefited by the opening up of these mines.

RICHMOND BASIN.—Arizona *Silver Belt*, Jan. 28: Wm. Gill, who was in the Globe from Richmond Basin yesterday, reports that chloridizers at that camp are all getting some ore. Joe Henry, Wm. Gill, Paul Johnson and Ben Hardin have a lease on the Mack Morris, and are sanguine of striking good ore. Lou Scanland, Bud Woodson and Ikenberry are sorting ore from the Helen mine, preparatory to shipment. Moyle and Viette are engaged in the same work, the ore coming from the Harrison & Morton claim, which is a good one. Joe Brewster and Clarence West are winning wealth from the North Star.

COLORADO.

BIG SIX.—Leadville *Herald-Democrat*, Feb. 1: The Big Six M. Co. evidently means business, as they have started in for work, the snow being cleared away from the immediate vicinity of the Big Six shaft, preparatory to the building of a large and commodious shaft and engine-house, while negotiations are now pending for the purchase of a large plant of machinery to go on that shaft. This starting up of the reorganized company means a great deal for that part of our camp, as without doubt all that section of country lying to the eastward of the Breece fault, up to the Highland Chief and Little Johnnie, is undoubtedly underlaid with mineral and only requires a little prospecting to develop it. At the time the old organization was working these claims, the ore from that section was not considered of very great value, but during the past three years such a change has come over the spirit of our dreams—of ore—and such an enhancement of the properties has occurred through the increased value of silver produced here, that they may now be worked, even on what ore was showing at the time of the closing down, to a profit. That the Big Six M. Co. will make a success of the undertaking would appear certain, though in our opinion the shaft selected for the commencement of operations is not the best one to begin on. The fact that nearly all of the ore found in these claims carries a very fair percentage of gold must not be lost sight of either, and that feature of the mining on that side of Breece Hill will eventually prove to be a very important

one, the gold assays alone, as we remember them, going as high as 18 ounces per ton, while the average breast samples, by control assays, would run an ounce of gold to the ton, and carry from 35 to 230 ounces in silver. There is now standing in the Netie Morgan a body of iron ore that will carry enough silver, together with the large percentage of iron in excess of silica, to make it pay a reasonable profit, and we are glad to see this district being taken hold of by energetic men who intend pushing the development. Our camp only requires a few more such practical undertakings to cause 1890 to be a year long to be remembered in the annals of Leadville prosperity. The Woodford Brothers, on the Champion, are said to be doing exceedingly well, some reports placing their output at such a point as to net the fortunate lessees some \$20,000 per month. They are undoubtedly doing very well, and probably are in no hurry to throw up the lease. The concentrating-mill at Recen is soon to be started up, after being placed in thorough repair, and is said to be doing this work in order to handle overflow from the White Quail, Aftermath and Delphos. Messrs. Ross & Co. are starting it up.

DAKOTA.

TO CONCENTRATE PYRITES.—Deadwood *Pioneer*, Jan. 28: Within hearing of a *Pioneer* reporter was dropped the remark a few days since, that an enterprise was projected which will prove of importance to Deadwood. It was further stated that capital to carry through the project was subscribed, and that some of the contracts had already been let. After not a little difficulty a clue was discovered, which being assiduously followed enables announcement that the projected enterprise is one to concentrate the Black Hills pyrites, treat them by a chlorination process and thereby add many millions of dollars to our annual yield of gold.

IRON ORE.—A force of from four to six men is now employed developing a ledge of iron ore on Elk creek. Average assays of the ore show it carries about 46 per cent metallic iron. The property is owned by Messrs. Blackstone and Grier of Lead City.

SYNDICATE SMELTER.—Fireclay and firebrick ordered from Rapid have not yet been received, so the little plant remains cold and lifeless. As several hundred dollars' worth of ore-fuel and coke yet remain on hand, Supt. Carpenter has concluded to start it up again as the cheapest way to get the money out of the supplies yet on hand. The *Pioneer* is informed that ore, etc., sufficient for a three days' run was upon hand at the time of the accident.

IRON HILL.—Elsewhere appears call for proposals to furnish lumber for rebuilding the Iron Hill hoisting works. The company proposes to lose no time in completing the plant, and will have it running and hoisting ore again most probably before the first day of March.

LOWER CALIFORNIA.

ALAMO.—Lower *Californian*, Jan. 28: It has been snowing nearly every night at Alamo lately, and in place of the mud which the people have been enjoying for some time there is now slush, and plenty of it. The weather is mighty cold, too, up there at Alamo, and the unlucky fellows who have not where to lay their heads are daily reminded that even in this Italy of America there are times when Nature is not all sunshine and singing birds. But a spell of cold and disagreeable weather cannot knock out the old miners, for the most of them are used to camps where there is more snow and ice than at Alamo, and they are staying with it. Don Pedro Miramontes has received a piece of rock from his ledge of decomposed quartz, located between the Remember and the Nuestra Señora de Guadalupe mines at Alamo. The specimen is one of the prettiest ever brought in from the camp, and sparkles with gold. This ledge has been worked for a month past by Juan Drew and old man Murietta with gold-pans, and they have averaged \$30 per day between them. The El Paso, the Lucas and the Lane mines are running and doing good work. Robert Frey and Cad. Preble were in town this week from Camp Nacional, where they have been sluicing, making \$30 a day between them for a few weeks. They had to abandon the work when the ground froze.

IDAHO.

LITTLE QUEEN'S RIVER.—Elmore *Bulletin*, Jan. 25: Speaking of this mining section and its possibilities recently with a gentleman from Atlanta, we learned of a mining district that has for years been under a cloud, but which in the near future bids fair to be a veritable El Dorado. The mines in question are on Little Queen's river, about 10 miles northwest from Atlanta, and are in a section well supplied with timber and water. There are at present: First—the Alvina lode, easily traced upon the surface a distance of 700 feet, showing a width of from 7 to 10 feet, the croppings at any place giving assay returns of from \$5 to \$30 per ton, and in a tunnel 235 feet to where it taps the lode and about 150 feet from the surface, the quartz returns \$45. Next in size is the Craigmoor lode, which is very uniform in width, being on an average about six feet. On this property there has been something like 700 feet of tunneling done, the ore giving assays of \$7, \$9, \$50, \$6, \$37, and in one place a pay streak from three to four inches wide on the footwall going \$280. On the opposite side of the hill is the Craig location. The assays from the Craig, however, do not go higher than from \$28.50 to \$30. The Wayward has a tunnel run 300 feet to the face, from which there is a raise 60 feet. This lode is about 4½ feet in width from wall to wall, and runs \$35 to the ton. South of these mines is the Letitia, having a tunnel driven near 150 feet from which there has been very rich ore, extracted going as high as \$400 per ton. Immediately south of the Letitia is the Finis lode claim. There are seven tunnels driven into the hill, and in six of them there are well-defined quartz ledges carrying pay ore from \$10.50 to \$700 per ton, chiefly in gold, and free milling mostly, although there is some of this quartz that yields very rich sulphurets. The last-named mine is the only one that has milled ore to any extent. It being mostly free-milling rock, there was a chance to make money out of it even in the early days when these properties were worked. The plant erected for the reduction of this gold ore was an early-day Huntington two-stamp rocker-mill, copper-plate process, capable of crushing not more than two tons per day. There

was not to exceed 100 tons of ore worked, and rock that did not go \$50 or more was never taken out. These mines have not been worked for the past 10 or 12 years, and until recently were owned by different parties located all over the country, but now the entire property is owned by Mr. C. W. Joy of Atlanta, Idaho.

MONTANA.

COPPER-PRODUCERS.—Inter-Mountain, Jan. 25: Little can be said of the mining industry for the week last past other than to note the improvements as they progress and the fluctuations of the copper market that regulates the opening up and shutting down of some of the prominent producers of this district. Almost all of the large copper-producers are doing all the work possible in extracting ore sufficient for the smelters, the latter not being half sufficient to answer the production of the mines, and some talk is going the rounds that improvements will be added to some of the already large smelters the coming summer so as to answer to the demands made upon them.

SMELTERS ALL BUSY.—The smelters are all working at their full capacity and making their regular shipments of copper matte and a vast amount of ore is being shipped out of the State for reduction in other parts. The new Silver Bow smelter is completed and is turning out its regular amounts. This company at first did not produce as pure matte as some of the other smelters, but the furnaces have been remedied and are now turning out the article as high or higher in grade than any smelter in the camp.

BUTTE AND BOSTON.—The mines of the Butte & Boston Co. are coming to the front, the rich strike continuing in the West Gray Rock, and if anything it increases in richness as the drifts progress. Sinking also continues in the East Gray Rock, though no ores are produced from this mine. The Silver Bow mine has encountered a much better quality of ore of late in the drifts on the 400 that tends to greatly enhance the value of the property. The mine is systematically worked and placed in a condition to work it on an extensive scale the coming summer. Much water has to be contended with and the drifts are as wet as any in the camp, one of the best indications of ore.

CHAMBER'S SYNDICATE.—At the Chamber's Syndicate of mines, the substitute for the Anaconda and St. Lawrence, they are meeting the demand made by the smelter at Anaconda. Their shipments run between 65 and 70 cars of 20 tons in each car every 24 hours, and at times the supply is such that the mines have to suspend for a day for the trains to pull the chutes down. All sinking has been stopped and only stopping is being conducted with a force of miners equal in number to any ever employed in the camp before. However, the output as yet does not equal that of the larger mines now suspended on account of the fire.

THE ST. LAWRENCE FIRE.—There is nothing of importance to note concerning the fire in the St. Lawrence, but that the water from most of the syndicate mines added to that of the Moulton Water Co. is still being used in endeavoring to extinguish the flames, but with what result cannot be determined. Water must by this time have reached the 800 of the Anaconda, though it would take an age to flood it, owing to the very dry condition of the mines in the upper workings. Nothing further is heard as to the intention of the company to sink a new shaft, but there is no doubt that (unless upon investigation the fire is found to be not nearly as extensive as surmised) they will have to sink a new one before the property can again be worked. No smoke or gases are discernible about the works.

THE MOUNTAIN VIEW OF THE BOSTON & MONTANA CO. is still cutting a station on the 900, and no crosscuts will be run at either the 900 or 1000 to tap the lead until the pumps are in perfect readiness to handle the water that is bound to be encountered. Pumps sufficient are in the mine and a thorough and competent foreman, Richard Dawe, stands ready to cope with any emergency that may arise. The Big and Little Colusas are plodding along as in the past, with ore in reserve to last for a generation. The great drawback of this corporation is the lack of smelting capacity, which the company will increase by the works at Great Falls.

COPPER PROPERTIES.—Most of the copper properties of lesser magnitude that laid idle for some time, owing to the low stage of the copper market, are again to the front. The sight at the Ramsdell, Shakespeare and Bricker Parrots resembles those good old days long since past, and puts one in mind of future prosperity. It seems pleasant to see the long line of miners of evenings coming home and going to work, where not long since quiet reigned supreme.

THE PARROT.—The Parrot mine is working steadier the present month than for many months past, producing about 250 tons of ore every 24 hours. The hoist has received a coat of whitewash and presents an elegant and brand new appearance.

THE LEXINGTON. where the most attraction is centered, owing to its great depth, is within two sets of what is called the 1500 level, which is really 1400 feet below the surface, the deepest in the camp. It will yet be some time before the company can determine the value of development, and it may be that the company may prospect the ground by the diamond drills and crosscut afterward. The company has diamond drills on hand and such very likely will be the mode of procedure. Ore for milling is taken all the way from the 600 to the 200, though considerable custom ore is being put through the company's mill.

THE WEEK'S BULLION.—Following were the shipments of bullion made from the camp this week: Moulton, \$22,481; Lexington, \$16,208; Lexington, \$35,441; Butte & Boston, \$21,152; Alice, \$47,200; Lexington, \$6760; total, \$66,032.

WEST OF THE GULCH.—The old Anselmo, which has so long lain idle, is to again assume its place among the ore producers of the camp, a lease having been given to Herman Hauswirth and his brother Robert. This mine has been dormant for a long time, while all the mines surrounding have been running steadily, producing their thousands.

At Lyon City. M. T., two miners were killed by a snowslide this week, and a great amount of property was destroyed.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

	Cash.	Debt.

*Unsold bullion \$44,893 and further shipments to hear from.

†With more assessments to be collected.

‡Offset reported of \$95,000 in bullion and further shipments to be heard from. Mine expenses to come out.

§January bullion returns not received, also mine expenses.

||Including the company's note for \$20,000 given in payment for mill.

Owing to snow blockades, many of the mines, expenses in last month not included.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, department 10, San Francisco:

BELVIDERE M. Co., Feb. 1. Location, Sierra Co. Capital stock, \$100,000. Directors—Charles E. Cahn, Edward Lande, Bert Schlesinger, John Cain and Edward J. Jackson.

CENTRAL AMERICAN DEVELOPMENT Co., Feb. 4. Object, to deal in real and personal property. Capital stock, \$1,000,000. Directors—W. L. Merry, W. B. Ewer, Richard Hoskin, Geo. W. Ostom, Thos. W. Jackson, Frederick Holmes and W. C. Quinby.

MASCOT M. Co., Feb. 5. Location, Nevada. Capital stock, \$1,000,000. Directors—Wm. Gauge, David Hunter, Herbert Spencer, H. W. Waller, and L. C. Fraser.

J. A. FOLGER Co., Feb. 5. Object, to carry on the grocery business of the late James A. Folger. Directors—Elizabeth B. Folger, Charles J. Paddock, Henry Wadsworth, Robert R. Vail and John H. Titcomb. Capital stock, \$400,000.

RIVER, HARBOR AND CANAL DREDGING Co., Feb. 5. (Incorporated under the laws of Colorado.) Capital stock, \$1,000,000. Directors—W. L. Merry, W. W. Montague, A. Boschke, W. H. H. Hart and F. Burrell.

Meetings and Elections.

Annual meetings and elections have been held by the following mining companies:

CALIFORNIA POWDER WORKS, Feb. 3: President, G. T. Lawton; superintendent, B. Peyton; secretary, John F. Lohse; Directors—G. T. Lawton, J. B. Haggin, John Birmingham, M. A. de Laveaga, B. Peyton.

PACIFIC ROLLING MILL Co., Feb. 5: Directors—William Alvord, N. Luning, James G. Fair, Edward Coleman and L. C. Bresse. Subsequently the following officers were elected: Wm. Alvord, president; L. B. Benchley, general manager; Patrick Noble, superintendent, and C. M. Keeney, secretary and treasurer.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Commonwealth, Feb. 2, \$15,000; Cons. Cal. and Virginia, \$80,000; Young America South, \$5015; Hanauer, Jan. 28, \$4200; Germania, 29, \$6192; Hanauer, 29, \$3175; Germania, 30, \$5439; Commonwealth, 6, \$19,000. Total for January, \$117,000.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall not be held responsible for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MECHANICAL PROGRESS.

Is the Blacksmith in Danger?

Several articles have recently appeared in our technical exchanges which seem to imply that the ancient and time-honored trade of the blacksmith is in danger of coming to an end through improvements in machinery. A correspondent of the *Blacksmith and Wheelwright* takes up the cudgel for the trade, which that journal specially represents, in the following somewhat vigorous manner:

Undoubtedly machinery has damaged some trades and entirely destroyed others, but just as long as wrought iron is used, the blacksmith's trade, though it may be modified, will not be destroyed. And further, until a metal as good and as abundant, and as cheap can be found, and one that can be welded—mark the word welded, for the weld makes all the difference between the smith and the tinker—there is no fear but what good blacksmiths will be in demand. A recent correspondent of your journal says: "Once he—the smith—needed skill to make horseshoes, horse-nails, and sometimes part of his simpler tools. His spare hours need to be occupied in producing a supply of these requisites of his trade. Now they are manufactured by machinery, etc." All that is true and more too; the blacksmith once made all his own tools, and also made the tools for every other trade, but not in my day. If the smith is a good workman he makes and repairs many of his own tools yet, and makes better ones than he can buy. In the large cities they are still generally making horseshoes by hand, for the reason that machine-made shoes are too soft and soon wear out on paved and macadam roads.

Let me tell the author of the above, a good blacksmith needs all the skill he ever did, just as much now, in fact, I think more. Sixty years ago there was no farm machinery either manufactured or to be repaired. The thrashers, the corn-shellers, both steam and horsepower, the reaper and mower, the sulky and gang-plow, the seed-sower, both for corn and small grain, to say nothing of the various kinds of harrows, the horse corn-cultivator, the horse hay-rake, and many other of the farmers' machines have all come into use within the last half century, and all of them are American inventions.

Fifty years ago the blacksmith had very little work during harvest-time, and many of them left the shop to mow grass or grade small grain. Now for six weeks before and during harvest he is kept busy repairing farm implements. Yes, and it requires no little skill to successfully repair such work. Then again, in the Eastern States, at least, in those days there was no such thing as a steel plow, all cast iron; now they are nearly all steel. Does that look as if the blacksmith was in much danger? But some one may say he will be seriously damaged by the nailless horseshoe. Not much. Read what they say: "It is requisite that a horseshoe that can be applied without the skilled labor of the farrier, should be easily adjustable, should require the use of no special tools, should be anatomically suited to the form of the foot, should entail no inconvenience to the horse in his daily work, and should not be liable to set up new dangers and difficulties as had, perhaps, as those it was designed to cure." Now does not that read just exactly like what is said about patent medicines? And still further, describing the nailless shoe, it says: "The manufacturers claim for it that it causes no pain to the animal either in putting on or taking off the shoe, assists instead of preventing the free and easy action of the animal, obviates sand cracks, thrashing or cutting, is not heavier than the ordinary shoe, is more durable, and last, but certainly not the least in its favor, is, that a stable boy can quickly adjust it. The shoe is adapted for all purposes, and of all kinds."

What do you think of that, horseshoers? One paragraph begins, the other ends up, by putting you down on a level with the stable boys! So any man or boy can easily fit horseshoes, can they?

HARDENING AND TEMPERING STEEL.—It has been remarked that, in the whole range of the mechanical arts, it is scarcely possible to find another process at once so simple and so common in principle, and yet so little understood in theory, as the hardening and tempering of steel. This is illustrated, for instance, in the hardening and tempering of the cold chisel, usually done at one operation. Thus, after heating the point, it is dipped in cold water, the tool in this way becoming hardened, and after cooling, the operator lifts the steel from the water and watches it closely as the heat remaining in the body of the metal diffuses itself through the hardened portion. As the heat spreads, the color passes from a white luster to a pale yellow, to a straw color, to a brownish orange, the point being now dropped into water again, that after cooling the temper may be that desired. If delay had attended the operation, the brown would be dappled with purple, then passing successively into full purple, light blue, full blue, dark blue, each color giving its own temper upon cooling, as bright blue for swords and watch-springs, dark blue for saws, etc. The philosophy of this has baffled scientific research, although upon the correct solution of the problem depends that bleeding of maximum hardness and

toughness which is such a desideratum. Now either is procurable at pleasure, as the colder the bath the harder the steel, and the slower, as in oil, the tougher; but extreme hardness is produced at the cost of tenacity, and vice versa.

Disposing of Old Rails.

There are two ways of cheaply economizing old rails. One method is that recently introduced by Edwin C. Wassel of Pittsburgh. This method consists of a process whereby old rails can be readily converted into a soft merchantable bar steel, suitable for horseshoes and kindred purposes. The old rails are first treated in the furnaces and then rolled into billets through the muck rolls. These are then transferred to the bath furnace and submitted to a slag bath, after which they are removed and run through the nine-inch mill, whence they are turned out and put into merchantable shape. Experiments thus far, says the *Industrial World*, justify the claims made by Mr. Wassel in behalf of his invention, and a company is in progress of organization for the purpose of operating the patent. Another process consists of

A Machine For Reducing Large Rails

To those of smaller dimensions. Says an exchange: There are thousands of tons of old rails of large pattern that have done long service and are more or less battered and worn. These rails are in too bad a condition to continue in use with safety, and yet too good to throw away. There is abundant use and demand for small rails for lighter purposes, and the large rails can just as well be utilized, as they are already in good shape to reduce and elongate. Messrs. Schell & Wolf, of Scranton, Pa., have devised an attachment to the rail rolling mill, whereby old rails of the large patterns can be readily reduced, and each rail greatly extended in smooth, finished condition, entirely new and good for a full term of additional service. The first requisite in the reduction of the large rail is to compress the web vertically to bring the crown and base closer together, enabling the rail to be inserted into the annular forming creases of the rolls. At a suitable point on the lower roll is an annular groove to engage the crown of the inverted rail. Correspondingly above is a smooth peripheral space of the upper roll that engages the base of the inverted rail, and the mutual compressing of the engaging rolls compacts the web of the rail, which is of course previously heated in suitable fire-heats. In order to maintain the rail in a true vertical position, the inventors provide longitudinal guides, which closely embrace the side recesses of the rails, and hold them from canting over or from misshaping the web. These guides are secured to vertical guard posts, and are arranged to be removable when not in use. A roller journaled at the point of introduction to the guides enables the rail to glide easily toward the rolls. One, two or three of these compressing courses may be provided, as desired. After the rail is reduced in size, it can be run through the regular reducing series in the usual manner until the required size is arrived at. Aside from the value of this device in the service it is capable of rendering, it is additionally important from the fact that the rail guides can be added to the regular guards with but little expense, and without any material alteration of regular working arrangements; hence hundreds of dollars and valuable space are saved in not requiring a special machine to compact the web of the rail to get it into working shape.

ABOUT SPIRAL SPRINGS.—The *Boston Journal of Commerce* says: How many have undertaken to wind a coil spring only to find that they have got it much larger in diameter than what they sought for, and the only way out of the difficulty has been to draw the wire out straight again and try it once more on a smaller arbor. It is much better to leave the coil as it is and fasten one end to a shaft of the right size and reduce the diameter by means of a hood-clamp such as the carpenter's use. Place the clamp over four or five coils and tighten them up solid and set the shaft in motion. The clamp will be carried along as if it were clamped on to a screw-thread, and the coil will be much reduced by the operation. Again, the same journal said: We have been asked how we should enlarge a spiral spring so that it will slip on easily over a steam pipe. For a slight enlargement it can first be screwed on to quite a large arbor by turning it in the right direction, and then given a set by screwing the hand-clamp tightly on three or four coils, and allow the spring to revolve till the clamp has traversed from one end to the other. The clamps also work well in winding a spring by first taking three or four turns by hand, winding the coils as far apart as may be desired, then clamping them firmly with a wooden hand-clamp, turning the arbor either by power or with the crank motion. The coils sink into the wood, form a nut, and the spring comes screwing out of the clamp with a true and even pitch throughout.

WELDING STEEL TO BRASS.—It is said that the Thomson Electric Welding Company has just made a successful experiment in welding steel pipes to brass in a way that the steel will split longitudinally without affecting the welding. The aim was to weld brass boiler flues to steel safe ends, which is of much importance, as steel will stand more heat than the brass.

SCIENTIFIC PROGRESS.

Strange Phenomenon.

A Phosphorescent Arch Observed in the Sky.

A curious phenomenon of nature was witnessed near here, says a special from Hearne, Texas, to the *Philadelphia Times*, by the north-bound passenger train on the Houston & Texas Central, which passes this point at 2:25 o'clock in the morning. It was in the form of a luminous arch of a phosphoric or electrical character. The luminous mist was first observed by the engineer when it was still several hundred yards ahead of the train, and thinking it a prairie fire, he slowed up, thus arousing the passengers, who, with the crew, crowded to the windows and platforms to look at the vast hueless rainbow spanning the heavens.

As the arch was more closely approached, its dim, white radiance was seen to be clearly defined against the sky as though painted there by the sweep of a brush dipped in white fire. The stars could be seen shining close against the rim of it, and all around and under the arch. The shape, as near as could be guessed at, was half a mile in diameter, though it seemed gradually widening and was in form the half of a perfect circle, one leg resting on the earth, while the other appeared to have been broken off near the base.

The arch rose directly over the track, and as the train approached it seemed to gather a quicker tincture of luster, as of the diamond or some clear, glittering star, though it threw no gleam upon the air beyond its own irradiation, as could be seen by the stars shining in close proximity to it. When the train passed directly under the bridge of light, the surrounding country spanned by it became plainly visible, appearing to be bathed in pale moonlight.

A curious feature of the luminosity was that while it gave all objects a weird, unreal aspect, the shadows which it caused them to throw were black and as clearly defined as silhouettes. In a few minutes after the train passed under the arch it seemed to fade away, melting gradually into the starlit sky. The night, as it will be remembered, was fair and fogless. There was no moon, so the arch must have been self-luminous.

[Such occurrences as the above, although rare, are not without precedents. We well recollect an occurrence of the kind which was seen in many parts of New England in the summer of 1834, and which exhibited precisely the same phenomena as above described. The writer was at the time pursuing his studies at Brown University, Providence, R. I. The first appearance of the phenomena was about nine in the evening, and in the northern portion of the sky. It formed a complete arch across the sky and gradually moved toward and a little past the zenith, just beyond which it slowly faded away. Its duration was an hour or more, as we now recollect it. The students were all called out upon the "campus," in front of the college buildings, where one of the professors improved the opportunity by giving us an impromptu, but very instructive and interesting, lecture on "the northern lights," with which phenomena it was, in the mind of the professor, intimately connected.]

The Forming of a Waterspout.

It is not often, if ever before the occurrence hereinafter noted, that any one who was capable of particularly observing the phenomena, has observed the actual origin of a waterspout either on sea or land. The following facts were recently communicated to the *New York Times* by Mr. F. W. Williams, who was an eyewitness of the occurrence. On the 1st day of January, 1840, the ship *Splendid* of New York, while on her voyage from that port to Canton, China, was lying becalmed off the west coast of the island of Borneo. It was very hot, and there was not wind enough to be felt with a wet finger. At 6 in the morning, about eight rods from the ship, a rippling of the water over about half an acre was seen. We watched it closely, supposing it to be made by fish; but no fish being seen, a tide rip was thought to be the cause. All hands were looking at it. The rippling increased in violence, steam in small puffs arose all over the rippling surface, moving about with a jerky motion, then it began to gather in a body and rise upward with a circular motion, assuming a cone shape. This caused all to look upward to the sky. To our surprise we saw a small, white, fleecy cloud directly over the rippling water, from which was coming down a cone-shaped white cloud. The white cone from cloud and water approached each other and joined, making the form of an hour-glass; the water of the ocean began to go up with a circular motion, and went up the white cloud in the sky. As the water rose, the column became dark, showing a hollow in the center like a thermometer tube. When the water reached the cloud in the sky, we could see it spread over the cloud like water poured on the ground; as the water spread the cloud became almost black in color.

The column remained near the ship until the cloud in the sky had become large and black. Then a current of wind above started the cloud, moving it very slowly to the eastward, dragging the column of water along, the water still rising from the ocean, and the black cloud growing larger all the time. It went about six miles from the ship. Then the column parted in the middle—one cone shape was drawn upward, the other dropped back into the ocean. During this time (about one hour) and until 12 o'clock noon a dead calm prevailed on the water. Not a cloud was to be seen in the sky except the one mentioned. It was a grand and beautiful sight, never to be forgotten.

We had seen many waterspouts at a distance before this one, and supposed, as we had been taught in school, they were caused by whirlwinds. Some time after arrival at my home in Syracuse, N. Y., Lieut. Manry, United States navy, came there and gave a lecture on the "Winds and Currents of the Ocean." When he was through I went to him and asked what caused waterspouts on the ocean. He answered: "Whirlwinds." I then asked: "If one is formed in a dead calm, what then is the cause?" His answer was: "When such things happen, for which we know not the cause, we say electricity may have done it. From observations on the ocean I am certain that electricity will be found to be the cause of many things that there occur."

DISEASE MICROBES.—The microbe, says a contemporary, is the first living thing which makes its appearance in organic matter undergoing decomposition. It is so small as to be scarcely distinguishable in its various species. The fact that the germs of disease cause terrible maladies was discovered by M. Pasteur. Among the contagious diseases spread by microbes are smallpox, tuberculosis, bronchitis and yellow fever. The microbe which attacks the human system is threadlike and cylindrical in form, and breeds at the rate of a thousand a minute. Pasteur holds that the quickest way to destroy them is to inhale oxygen freely, but physicians say there are some diseases which this gaseous treatment would destroy, while there are others which would not be likely to be affected materially by it. If a man shut himself up in a room and kept the air therein loaded with sulphur fumes, the chances are, of course, he would not fall a victim to any distemper caused by bacteria; but an occasional inhalation of such is not, by any means, likely to prevent infection. The most active of all microbes yet discovered is said to be "la grippe" microbe. When seen by the aid of a microscope of 5000 diameters only a faint outline of their various forms can be discerned. The covering or coat of the bacteria, so far as can be ascertained, is a gelatinous matter nearly transparent. The powerful lights required to illuminate the disc on which the semi-transparent germs are shown sometimes prevent their being seen, the rays of light being much coarser than the microbes themselves. There are two special recognized forms of poisons, gases and fluids; both are known to be filled with these germs, and large numbers of them are inhaled daily, many of which manage to impact themselves in the system. It is coming to be a generally recognized fact that all diseases are due to fermentation, and that the presence of microbes in the system is the cause of the same.

THE CORPUS CALLOSUM is a small spongy body situated just at the base of the brain. The object and functions of this portion of the human anatomy has long puzzled the minds of our most learned physicians. There is a certain class of spiritualistic teachers who have made the human anatomy a special study, who hold that this organ is a separate but as yet undeveloped brain, which will gradually develop with the mental and spiritual development of the race, and that finally it will become the ruling organ of mental and moral activity—that it will at some future time become the medium through which man will become perfectly familiar with what are now sometimes called the "occult sciences," or those sciences upon which depend the phenomena of mesmerism, modern spiritualism, clairvoyance, foretelling of future events, etc. Quite recently, according to a late article in the *Electrical World*, Dr. A. H. Stevens of Philadelphia, a gentleman of some considerable note as a medical student, has put forth the idea that this organ constitutes the apical location of the soul or mind of man. He says: "The corpus callosum is the seat of the imperishable mind, and is the great reservoir and storehouse of electricity, which is abstracted from the blood of the arteries and conveyed through the nerves up the spinal cord to the corpus callosum."

THE ORIGINAL GATLING.—According to *Notes and Queries*, the Gatling gun and revolver were foreshadowed as long ago as 1720. About that time one James Puckle, an original and inventive genius, published an engraving on which was represented a large revolving gun, mounted on a tripod, the breech of which was to be turned by hand, and which contained six chambers similar to the earliest revolving pistols. The piece could be elevated or turned in any desired direction. The part containing the chambers was removable at will.

CORK.—A sheet of cork one pound in weight will support the body of a man in water.

GOOD HEALTH.

Turpentine Treatment.

A writer in the *Medical and Surgical Journal* says: "I have been using pure oil of turpentine in affections of the throat and lungs for some time, and find better and more satisfactory results than from any other remedy I ever tried. I use the ordinary hand atomizer, and throw a spray of the liquid into the throat every few minutes, or at longer intervals, according to the gravity of the case. The bulb of the instrument should be compressed as the act of inspiration commences, so as to insure application of the remedy to the whole surface, which can be done in cases of children very successfully. It is surprising how a diphtheritic membrane will melt away under an almost constant spray of pure oil of turpentine. I now use the turpentine spray whenever a child complains of sore throat of any kind. In cases of tuberculosis of the lungs, bronchitis and the latter stages of pneumonia, I have found the turpentine inhalation very beneficial. I use an atomizer, or paper funnel, from which the turpentine may be inhaled at will. I hang around the bed and in the room flannel cloths saturated with oil of turpentine, in all cases of catarrhal bronchitis—in fact, in all affections of the air passages, and my patients invariably express themselves as being very much relieved."

Terebenth.

Quite recently we are told of a new preparation from turpentine, which is probably less harsh in its action than the oil, and, perhaps, quite as effective. This preparation is known as "terehene." It is a clear, colorless liquid, with an odor of "fresh sawn pine wood." It is prepared from turpentine by the action of sulphuric acid. This is practically a new remedy, and has been but little used by physicians in this country, but some in England have evidently given it a good trial. Its special efficacy appears to be in diseases of the mucous membranes, as is the case with turpentine. One physician reports having used it in over one hundred cases of what he terms "winter cough," which is evidently part acute and part chronic. He found that, in very many cases where every form of treatment which had been employed had proved valueless, terebenthine had a marvelous effect, expectoration becoming freer, the breathing better, and the general condition much more comfortable. The medicine was usually given in ten-drop doses, on sugar, every four hours at first, and less often as the cough improved. In the most obstinate cases the dose was doubled. Terebenthine is practically harmless, but twenty drops is as much as one ought to take, and the physician in question says it is best to begin with five or six drops on sugar every four hours and gradually increase to the maximum dose given. The remedy has also been found to act exceedingly well in acidity and flatulence, from which so many victims of chronic bronchitis suffer more or less. In terebenthine it is evident that physicians have a valuable addition to their list of remedies.

TAKE A DAY IN BED.—There is no better preventive of nervous exhaustion than regular, unhurried, muscular exercise. If we could moderate our hurry, lessen our worry, and increase our open-air exercise, a large proportion of nervous disease would be abolished. For those who cannot get a sufficient holiday, the best substitute is an occasional day in bed. Many whose nerves are constantly strained in their daily vocation have discovered this for themselves. A Spanish merchant in Barcelona told his medical man that he always went to bed for two or three days whenever he could be spared from his business, and he laughed at those who spent their holiday on toilsome mountains. One of the hardest worked women in England, who has for many years conducted a large wholesale business, retains excellent nerves at an advanced age, owing, it is believed, to her habit of taking one day a week in bed.—*Boston Traveller*.

OZONE AND HEALTH.—One of the great causes of the excess of sickness in cities over country residence comes from the lack of ozone in the city. Sir Edwin Chadwick, known in England as "the father of sanitary science," says there is no ozone at the surface of the thickly-built streets of London—at the base of St. Paul's for instance—but there is at the summit, and if pumping machinery which would pump down the ozone from above were put in motion, the health of great cities would be much better than at present.

GRIEF AND PAIN come alike to all, and cannot be escaped by any; broken hearts are to be found in palaces as well as in cottages, and the bond of brotherhood seems strongest when love and pity unite all hearts, and reverence for what is good lifts up our souls.

CARELESSNESS THE CHIEF CAUSE.—A man in Cincinnati who has preserved a record of 320 railroad accidents in this country during the past year finds that only 13 occurred from causes beyond human control.

ROOM AT THE TOP.—Yes, there is plenty of room at the top, and there always will be, unless facilities for getting there are improved.

USEFUL INFORMATION.

THE MEANING OF "F. O. B."—A correspondent of the *Iron Age* writes to that journal as follows: "Please give me through your columns the correct meaning of the business term 'f. o. b.' I claim that it means no charge for boxing or cartage; that there should not be any charges of any kind added to the cost of the goods. Some shippers claim that the term applies only to cartage and has nothing to do with boxing, etc." The *Iron Age* answers as follows: We presume there are few business terms that create more discussion than "f. o. b." During the summer of 1887, the matter was brought up, and we secured opinions from a very large number of business men all over the country and printed the correspondence. The replies were very numerous, and we continued the discussion of the subject through several months. Our correspondent could not do better than to look up the files of the *Iron Age* and read the contributions to this subject published between July and October, 1887. The opinions expressed in these letters were pretty evenly divided between the two interpretations of "f. o. b."—whether it meant deliver free of all charge, or whether it only referred to the cartage and left the boxing to be charged extra. It is generally conceded, however, that the best interpretation of the term means free of all charge, and that if boxing or crating is to be added, it should be so stated at the time the goods are sold. This, however, is a matter of opinion, for so far as we know the interpretation has never been absolutely fixed.

STAMP AND OTHER COLLECTORS.—There seems to be a mania for the collection of useless things. It has been called the "philatelic mania." One of the latest hobbies in this direction is a man who the *Washington Post* says is devoting his time to collecting old bottle corks, which he classifies according to the liquor their bottles contained. So expert has he become that when he picks up a cork in the street, he will tell on the instant to what class it belongs. Of course, no man's mind can be of a very high order to be satisfied with doing nothing but collect bottle corks or letter stamps. It is said that in Germany, Austria, and in some of the petty kingdoms of Europe, the stamp collectors are getting into bad repute with their respective governments. It is thought the passion leads to disloyalty if not to anarchy, for the reason that the collector is always anxious for a change in rulers, as that leads to changes in stamps, which widens his opportunity for business. There are said to be at least 200 old stamp-shops in Europe which are looked upon as hotbeds of addition. They even have a newspaper conducted in the interest of the business, called the *Philatelic Record*. A travesty on the old saying reads as follows: "Uneasy lies the head that's on a stamp," for the fear that a new face may appear thereon.

THE GULF STREAM NOT RESPONSIBLE.—The theory that the Gulf Stream is responsible for our abnormal weather, by hugging our coast closer than in past years, is denied. It is pointed out that the warm current issuing from the Gulf of Mexico can only affect the weather by conveying heat and moisture to the air overlying it, and then transferring these conditions to the land by air currents. But the truth is that the prevailing winds passing over the Gulf Stream blow toward the northeast, and away from our coast. They modify the climate of Northern Europe, just as the air passing over the Japan current gives a mild climate to British Columbia and California. Of course, at times, we have southeasterly winds, and the temperature and rainfall of the Atlantic seaboard is materially affected thereby; but the difference of a hundred miles or more in the position of the Gulf Stream would have in itself little effect on our home climate. The distribution of barometric pressure and marked departures from normal pressure, from whatever cause they may arise, are much more likely to bring about abnormal weather, and we must study such changes rather than the ever-winding and waving Gulf Stream.

REDUCING THE NUMBER.—The arrival of Chinese by the Canadian Pacific Railway steamships from China in British Columbia during the year 1889 were 500 less than the departures for China. If to that depletion is to be added the great numbers who are crossing the line into the United States, British Columbia will soon be a "happy land."

MIXED FARMING DESIRABLE.—The big wheat farms have not been profitable in Dakota for some years past, and, as a result of the great drought this year, they will probably be subdivided and mixed farming will be introduced. This will make things much more lively in that part of the country and will introduce mechanics and machinery of all kinds.

PROHIBITION TOWNS.—The *Banning Herald* says: Southern California has ten prohibition towns, with a good prospect of adding Redlands and Oceanside to the list.

A GOOD IDEA.—Each division of the Boston police force is to be supplied with a long wooden pole, to which in the day-time will be attached a blue pennant, marked "Police,"

and at night a blue lantern, which will be carried to fires for the purpose of indicating where the superior officer can be found, the pole being shifted as occasion requires.

An international exhibition of postage-stamps will be held in Vienna next year in commemoration of the 50th anniversary of their introduction.

ELECTRICITY.

Safe Electric Lighting.

The superiority of electric lighting over all others is now very generally recognized, and the great problem is how to furnish it in large installations and in a manner which shall render its use both simple and safe. The fact that, as now distributed, it is not safe should not be regarded as any reason why it should be abandoned. As the practice now is, it may be said that all sorts of wires are run in all sorts of ways except the correct ones. That there may be found a correct and a safe way to distribute electric-light currents, there can be no doubt. "We can't" is an expression which should not be allowed. "How can we?" is the important question which just now should engage the attention of all electricians.

Placing the wires underground would eliminate many of the causes from which accidents arise. There are well-understood safeguards which might be brought more generally into use. The conversion of high pressure, continuous currents to low-pressure currents by means of "direct current" or dynamo converters is being rapidly developed. Much might be accomplished by a more careful placement of wires both inside and outside of buildings. We have already many methods for securing safety which have not yet been generally introduced, and there can be no doubt but that many other and still more practical ones will from time to time be devised and introduced for accomplishing the much-desired result of practical safety.

The limited experience of the cities of Chicago, Philadelphia and New York in the use of underground cables, to say nothing of the wider experience in this direction in the cities of Berlin, Milan, Rome and other European cities, indicates that the success of properly constructed underground conduits, whether for currents of high or low tension, has been quite well established.

We can hardly expect to see the best results obtain in the short time which has elapsed since electric lighting was first introduced. The best and most inventive minds in the world are just now bending all their energies to this work. Let us go slow, work cautiously and patiently, and await the time which will surely come when a perfectly safe, cheap, efficient and universally applicable system of electric lighting will be presented to the world.

ANNEALING STEEL.—There are two ways of annealing steel. It can be heated to a dull red heat, covered with dry, warm sand and left to cool slowly, or heat and cover up in the forge fire and leave it there until the fire is out and all is cold. The other method is to heat the steel red hot; heat gradually, let it "soak," as the smith says, until it is evenly heated, then remove from the fire and go to some dark corner. Let the steel cool until you lose sight of the dull red in the dark, then cool off in cold water. A good "dark place" may be made by throwing your coat over a harrel, leaving just room enough to look in at the iron. This method is called the "water anneal," and is based upon the theory that steel softens when cooled at a certain temperature.

THE ELECTRIC LIGHT is being more and more used among the manufacturers of the wood-working class. It is practically the only light in use at the present time in sawmills, cash and door factories, furniture factories, and all the wood-working establishments where a superabundance of inflammable material and more or less dust is unavoidable. Manufacturers recognize that they cannot afford to risk the lighting of their plants with lamps, or even gas, with the danger from fire which these illuminators offer. And as a rule, where motive-power is abundant and cheap, electricity, besides affording the best and safest light, is in the long run the cheapest.

LIGHT WITHOUT HEAT will probably be the next thing to which serious attention will be called after the perfection of the present system of electric lighting. The possibility of such an attainment is foreshadowed in the light produced by the fire-fly. But the full understanding of the phenomena connected with that insect is too far ahead of our present philosophy to hope for anything more than an imaginary picture of what may be possible during the next few decades. That such a result will come in time may be considered as a thing almost certain.

FOOD FOR THOUGHT.—The *Electrical Review* opens up a new field of thought and discussion by asking why the mere magnetization of a bar of steel makes of it a machine for the transformation of energy. It is said that a magnetized horseshoe will lift a pound of iron and hold it for an indefinite period of time. In every second of that time it is not only expending energy, but also increasing its actual power; and the question is, where that shaping potency

comes from—whether from gravity, atmosphere, solar rays or earth currents. We seem yet to have hardly reached the confines of investigation into the forces of nature.

A NEW ARC LIGHT.—George Westinghouse announces that his company is about to supply New York City with a new system of arc electric lighting, which will be perfectly free from danger. It will consist of main currents underground, each lamp to be operated therefrom by an inducted current. An announcement from such a source carries with it a belief that it contains something more than mere words, and encourages the thought that electric lighting will soon be as safe as light from a wax candle.

ENGRAVING BY ELECTRICITY.—Engraving on glass and crystal by means of electricity, the discovery of which has already been noticed in these columns, is said to be now in practical operation. The glass is covered with a concentrated solution of nitrate of potash and put in connection with one of the poles of the battery, and the design is traced out with a fine platinum point connected with the other pole. By this process it is claimed that marvelously delicate work can be done.

THE BUILDER.

Properties of Quicksand.

The properties of different kinds of sand is a matter of very great importance to builders. The properties of quicksand are described in the *Mechanical News* as follows: "The difference between building sand and true quicksand is most easily explained by comparing building sand to road metal, while the quicksand must be represented by fragments no larger than large huckshot, but shaped like very smooth potatoes. In a word, the quicksand is small and thoroughly water-worn, so that every fragment has been deprived of all its angles and fairly well polished. Its particles are very small as compared with those of the building sand. The smaller the size, and the more complete the rounding, the more nearly will the sand approach a liquid condition when it is moistened. The first glance at a fairly mounted sample of quicksand under a microscope is sufficient to show that the quickness of the sand is amply accounted for by the innumerable friction-wheels which the particles themselves furnish. Sharp or building sand, on the other hand, will show few round corners, many angles, corners, and a general condition like that of broken stone.

"Sea sand is often unfit for building, even though perfectly deprived of its salt, the reason being that the particles have been worn and polished till they have no more hiding powers than so many cobblestones. It is well to remember that quicksand when dry, if very fine, shows the same properties as a liquid. In holding up the centers of large bridges it is sometimes put into cylinders with a plunger on top of it. It will, when thus confined, hold up the load like a column of water. When it is desired to strike the center, a plug is drawn out of the side of the cylinders, and the sand flows out like so much water. The advantage, of course, is that the sand does not need a packed piston and does not leak out, though the work be prolonged for years. Quicksand when dry and confined forms an admirable foundation, and when wet can be loaded over its whole surface, and give a good support if side openings can be avoided."

Preparing Loose Sand for Foundations.

A new process of preparing foundations has been patented by F. Neukirch of Bremen. Its object is to make loose sand firm and resisting as solid rock. At present, the universal method of doing this work, if under water, is to remove all loose material and then make a beton or other similar substructure. The process under consideration, which is only of use where the materials are fairly clean silicious or calcareous sand, aims at consolidating the grains by covering them with a film of cement, which is forced into the spaces between the particles by compressed air, steam or water under pressure. Sheet piles are employed to prevent the spreading of the cement over more ground than is necessary. The system has been largely used in the harbor of Bremen with gratifying results and is to be tried in preparing dry foundations.

BUILDING ASSOCIATIONS.—The success of co-operative building associations in the United States has been marvelous. They were first started in Philadelphia in 1831. There are now 450 organizations in that city and many more in other portions of the State. There are 80 associations in Rochester, New York; no less than 170 in New Jersey. The total number in the United States is estimated at 4000, and that number is increasing at an estimated average of two each day. It is estimated by a London daily that there are about 2500 building associations in the United Kingdom. The amount invested by these associations in that country in 1889 was about \$100,000,000.

CONCRETE WALLS FOR BUILDINGS are built of one part of cement to six or seven of clean broken stone or gravel. Boil some soap to the consistency of paint, and apply freely with a brush, to the planks of the molds, to prevent the adhering of the cement.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Silver Mill for Crushing Ores Dry; Magnetic Machines for Concentrating Ores, 91. Geological Map Showing Mining Districts in Southwestern Colorado, 99.

EDITORIALS.—Concentration of Iron Ore, 91. Passing Events; A Dry-Crushing Silver-Mill; Listing Mines on Stock Boards; Geology of S. W. Colorado; Drift Mines and the Laws, 98.

CORRESPONDENCE.—Copperopolis; Inspection of Mines; Californians in Antwerp and London, 92.

MISCELLANEOUS.—Gen. Bidwell is Reminiscence; A Medal Bill; The Olive in California; New Mexican Camps; Students of Mineralogy; Down a Shaft, 93.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 94-95.

MECHANICAL PROGRESS.—Is the Blacksmith in Danger; Hardening and Tempering Steel; Disposing of Old Rails; About Spiral Springs; Welding Steel to Brass, 96.

SCIENTIFIC PROGRESS.—Strange Phenomenon; The Forming of a Waterspout; Disease Microbes; The Original Galling; Cork; Miscellaneous, 96.

GOOD HEALTH.—Turpentine Treatment; Take a Day in Bed; Ozone and Health; Carelessness the Chief Cause; Room at the Top; Miscellaneous, 97.

USEFUL INFORMATION.—The Meaning of "F. O. B.," Stamp and Other Collectors; The Gulf Stream Not Responsible; Reducing the Number; Mixed Farming Desirable; Prohibition Towns; A Good Idea, 97.

ELECTRICITY.—Safe Electric Lighting; Annealing Steel; Food for Thought; A New Arc Light; Engraving by Electricity; Miscellaneous, 97.

THE BUILDER.—Properties of Quicksand; Building Associations; Miscellaneous, 97.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 104.

Passing Events.

Although heavy snowing has stopped in the mountains, there are still more or less inconveniences as the result of the great storm. The rivers are all high, and railroad traffic is uncertain. The Oregon road will not be open for some weeks, and we are without many exchanges from distant quarters.

The mines of this State and Nevada are pretty well at a standstill. High waters, frozen ditches, snowdrifts and had weather have combined to stop ore transportation and mining or milling work. As a consequence, there are many idle miners just now. The coming season, it is hoped, will make up by its prosperity any damages occurring now.

The recovery of the winze pump in the Pioche Cons. mine means a good deal for Pioche, Nev., for the mine will now be cleared of water. The local papers say the condition of the pump was such as to suggest that the abandonment of prospecting below water was not on account of not being able to handle it, but was some sort of a job. The valves of the old pump were said to have been set wrong.

AN UNSUCCESSFUL STRIKE.—At a meeting of the Boiler-Makers' Union held last Friday evening, the boycott against the Risdon Iron Works was withdrawn. It will be remembered that the boiler-makers struck over 12 months ago, since which time their places have been filled by non-union men. No concession whatever was made by the Risdon Works.

Copper.

While the year 1888 will be memorable in the history of the copper trade for the rise of the French syndicate to control all the supplies of this metal, the year 1889 will be also memorable for its fall, which latter entailed a loss upon France of \$75,000,000 to \$100,000,000. The want of capital was the primary cause of the collapse, as the contracts made were too high. Instead of closing the contracts with American and other mining companies simultaneously, they were arranged with one after the other, giving the later ones a chance to get big prices. The effect of the syndicate's operations, extending over a period of one year and five months, was an increase of the stocks of copper in this country, England and France—from the minimum of 58,000 tons at the end of 1887 to the maximum on May 1, 1889, of 179,000 tons—of 121,000 tons, about one-half of which was due to increased supplies, and the other half to diminished consumption.

James Lewis & Sons of Liverpool, in their annual report, give statistics which show that the direct import of copper into England and France in 1889 was 14,077 tons less than in 1888; that, exclusive of the Chili bars transferred from England to France, the export of copper from England exceeded that of 1888 by 26,118 tons; and that the apparent consumption of England was 23,197 tons greater than in 1888, while the apparent consumption of France was 3338 tons less. Taking the average English and French consumption and English export for the two past years, 123,640 tons, it is 2700 tons per annum less than that of the previous two years, nearly 11,000 tons less than that of the years 1885 and 1884, and nearly 7000 tons per annum less than the average of the four years 1884 to 1887. It is therefore evident that the large deliveries of the past nine months have hardly made good the great depletion of stocks all over the world, without in any way supplying the greatly increased demand due to the present revival in trade, and the special demand arising from the extended use of electricity and of sulphate of copper.

The value of telegraphic wires and apparatus exported in 1889 was £1,040,082 against £521,055 in 1888, or more than double, as the cost of the copper used in 1888 was higher than in 1889, and the value of machinery and mill-work exported in 1889 was £15,254,658 against £12,939,267 in 1888; in this case, however, the value of the iron used was greater in 1889 than in 1888; 1,286,426 tons of steamers and sailing vessels were built in 1889, against 903,687 tons in 1888 and 578,600 tons in 1887, the orders in hand at the end of 1889 representing 810,000 tons irrespective of government orders. This is the largest amount of tonnage ever produced in one year, and the promise for the present year is most favorable.

The consumption of the United States has exceeded that of 1888 by 27,500 tons.

The impetus given to production by the high prices paid by the syndicate increased the import into England and France from 117,000 tons in 1887 to 160,000 tons in 1888, but during the past year it has fallen to 146,000 tons under the influence of the low prices which followed the collapse of the Syndicate. The most notable decrease has been in shipments from Chili, 8500 tons, and from "other countries," nearly 8000 tons, while from the United States it is 500 tons, from Australia 500 and from Japan nearly 2000 tons. The increase from Spain and Portugal is, however, 1500 tons, from the Cape of Good Hope 2700 tons, from Quebrada 700 tons, and from Mexico 1800 tons. The total production of the world for the past year is estimated at 263,000 tons against 260,000 tons in 1888.

The quantity of copper produced during 1890 will mainly depend upon the level at which the value is maintained. At £50 for good merchantable copper, there is little doubt that most, if not all, of the large producers can work to a fair profit, while this price will in no way interfere with consumption.

This latter promises to be very large with the great extension of the use of electric light and power, the increasing demand for sulphate of copper, the brass required for the numerous war and other steamships in course of construction, and the locomotive and machinery for which makers are full of orders up to nearly the end of the year.

A Dry-Crushing Silver-Mill.

Silver-milling ores are either free or base, and the latter require a preliminary or chloridizing roasting. The free-milling ore passes through the same process as gold ores (described in last week's PRESS) until the battery is reached. The ores are crushed wet on the battery; but battery amalgamation is not practiced. From the battery the pulp passes through sluices into settling tanks, where the superfluous water is drained off. The pulp is then shoveled into the pans, where salt and bluestone or other "chemicals" are used. Here the ore is first ground and then amalgamated. After several hours the pulp is run into settlers, where it is diluted with water, and the heavy amalgam and quicksilver settle to the bottom. This is then collected and strained and the dry amalgam re-torted.

Base or rebellious silver-milling ores contain too much sulphur, arsenic, antimony, etc., to be treated by free-milling process. After crushing in a rock-breaker, they require a previous chloridizing roasting to adapt them to the pan-amalgamation. They are "dried" before stamping, and then stamped dry. The mortars have double discharge. The pulverized ore is discharged through the screens of the mortars is carried by conveyers to elevators, which lift it to the furnace floor. The White and the Howell furnaces are supplied with pulp by a gravity chute.

There are several types of furnaces in use, notably the Brookner, the White & Howell, the Stetefeldt, the O'Hara, and the ordinary reverberatory furnace.

The time of adding salt depends on the mineralogical character of the ore. When there is much arsenic or antimony present, salt is economized by a preliminary oxidizing roasting of the ore. The salt is crushed either separately or with the ore. It should be thoroughly incorporated with the pulp. To obtain a high degree of chloridation, sufficient sulphur must be present to effectually liberate the chlorine of the salt. Calcepar, braunspar and fluorspar, etc., retard the chloridation by absorbing a large part of the sulphuric acid produced. Minerals containing arsenic, antimony, tellurium, selenium, etc., increase the loss of silver arising from volatilization. Zincblende requires long roasting to convert it into sulphate. The subsequent process of amalgamation is similar to that described with reference to the treatment of free-milling ores, though the grinding process is usually omitted or curtailed in the pan-amalgamation of roasted ores. The cut on page 90 is a dry-crushing silver-mill designed by the Union Iron Works of this city.

Listing Mines on Stock Boards.

EDITORS PRESS:—Can you kindly inform me what are the requirements of the San Francisco Stock Exchange as to listing mining stocks. Is the stated amount of output, or development and production considered in any way?
Mariposa, Cal.

Mr. Fred Hadley, the secretary of the S. F. Stock Exchange, informs us that the fee for listing a mine on the board is \$1000. Afterward the annual dues are \$100. The application is referred to the Stock-List Committee, who, if satisfied that it is not a "wildcat," and possesses merit, will put the stock on the list.

It does not seem, from experience, that any very rigid examination is made in these matters, not half as much as should be the case. A good many "wildcats" have been listed first and last, greatly to the detriment of the whole mining-stock business.

It is, perhaps, not practicable for the Stock Board to send an expert to examine every mine to learn whether it is fit to be listed; but if more care had been taken in the past the mining stock market would be in better condition than it is to-day. If people were sure of a certain degree of protection in these matters, and knew when a mine was listed, so its stock could be bought and sold; that it was a bona fide operation, they would feel more like investing occasionally. As it is, the principal requirement seems to be the fee.

JOHN J. DORSEY, who has been for 35 years Wells, Fargo & Co's agent at Grass Valley, died last week. He was the owner of the Maryland mine, which adjoins the famous Idaho, but which has never been properly opened or developed.

Geology of S. W. Colorado.

In a paper read some time since before the American Institute of Mining Engineers, Mr. T. B. Comstock went at length into the geology and vein structure of Southwestern Colorado, or that portion of it in the southern third of the Colorado Highland, with a part of the neighboring plateau upon the west. We have not the space to give his views on the general geology of the district, but the character of the formation is given in the accompanying geological map. See opposite page.)

In this district are three or four types of mineral veins, structurally considered, but there are really close genetic relations in all of them.

Beginning at the eastern edge of the area covered by the geological map, the Summit district occupies a small patch of territory set like a nook in the mountains. From this westward nothing appears until the Continental divide is crossed in the northeastern portion, where the Lake City district introduces us to the general features of the deposits which are crowded over the wide region occupying the largest part of the map, culminating in San Juan county. Intimately connected with the latter area, but unique in character, is the restricted Red Mountain district, largely in Ouray county, and off to the southwest lies the Reco field.

Although the great central San Juan area proper is very complex, and made of many distinct groups, there is yet such a kinship in the whole as to indicate a common genesis, with structural variations due to secondary causes. In the Summit and the Reco districts, however, there is not this close relationship either to the San Juan area or to each other. Another independent district, in general terms, is that of the La Plata mountains.

Taking the districts in the order of their vein formation, we have both the La Plata area and the Reco belt occurring among the earliest volcanic rocks—porphyrite and andesite—chiefly the latter. Probably the Summit district came next and the central-region fissures were certainly not filled until after the tectonic outflows, including the rhyolite. The Red Mountain epoch was, in its finishing acts, not only post-glacial, but of later date than the Tertiary period. The veins are intimately associated with the volcanic rocks.

The map shows a little of the present surface features of La Plata district. The district is pre-eminently gold-bearing, though silver ores are not wanting. Tellurium compounds very rich in gold are frequent. The veins are numerous and intricately mingled, and there are some placers.

The Reco belt is not apparently distinct from the La Plata area in origin. Many of the veins at Reco are intimately associated with the carboniferous limestone, giving them much the character of the "contact" deposits similar to those of Leadville. Nuggets of gold and native silver occur in some veins, but the ores are usually complex or simple sulphides. As a rule, the veins are worked in the region of andesite intrusions.

Summit district is a very small area remote from the La Plata region, which it most resembles. In certain features its deposits approach some of the veins which lie near the outskirts of the central San Juan area on the side next to the Reco district.

In the Red Mountain district the deposits are not in well-defined linear orebodies, but occupy irregular cavities, apparently related in some general manner to deep-seated fissures. The vein-matter is far from uniform, and is usually of complex character. Almost all known mixtures of the sulphides, arsenides and antimonides of iron, lead, copper and zinc are found mingled indiscriminately with varying percentages of the precious metals. The geological map exhibits graphically the facts which formed the basis for the generalizations in Mr. Comstock's paper. The deductions have been made from observed facts.

THE Young America mine, north of Sierra Butte, Sierra county, lost its drying-house, dump-house, barn and shed, at the mouth of No. 2 tunnel last week, by fire. The buildings were at the time surrounded and covered by about 25 feet of snow.

ADAMANTINE.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JAN. 14, 1890.

- 419,301.—ARMOR FOR SHIPS—L. B. Abraham, S. F.
 419,241.—FLEXIBLE SHAFT COVERING—F. W. Bidley, S. F.
 419,599.—TONGS FOR HOLDING PLOWSHARE—L. W. Cox, Gold Hill, Or.
 419,246.—ROCK-BREAKER—M. B. Dodge, S. F.
 419,247.—ROCK-BREAKER—M. B. Dodge, S. F.
 419,243.—PUMP—Geo. E. Dow, S. F.
 419,323.—CLIPPING MACHINE—J. W. Eisenhuth, S. F.
 419,517.—WATCH-CASE SPRING—B. M. Greene, Eckley, Or.
 419,519.—WASHING MACHINE—G. W. Maich, Seattle, Wash.
 419,256.—CRUSHING-MILL—F. A. Huntington, S. F.
 419,526.—WINDMILL—W. H. Keep, Stockton, Cal.
 419,266.—FILTER—E. M. Knight, San Mateo, Cal.
 419,337.—SACK-DETACHER—L. Martin, Rickreall, Or.
 419,466.—CLIP FOR ROPEWAYS—B. McIntire, S. F.
 419,535.—DOUGLE TREE—M. B. Morrison, Yakima, Wash.
 419,277.—DRAINS OR SEWERS—B. W. Murray, Seattle, Wash.
 419,548.—WAGON BRAKE—Pardee & Leaman, Lower Lake, Cal.
 419,284.—TRACTION ENGINE—Jacob Price, San Leandro, Cal.
 419,477.—BOTTLE-STOPPER—J. M. Schofield, Merced, Cal.
 419,294.—ROCK-BREAKER—Spiers & Booth, S. F.
 419,386.—DEVICE FOR TRANSMITTING POWER—A. Von Babo, Seattle, Wash.
 419,579.—THRILL-COUPLING—L. N. Woodie, Albany, Or.

The following brief list by telegraph, for Feb. 4, will appear more complete on receipt of mail addresses:

California—John W. Bain, Gonzales, gates; Frank V. Carman, Oakland, miter-box; Henry Craigie, San Francisco, dental plugger; George D. Crocker, Oakland, hinge for window-sashes; John W. Eisenhuth, S. F., device for transmitting motion; Benjamin Holt, Stockton, thrashing machine; Henry O. Hooper, Eureka, latch and lock combined; John H. Jeffrey, Crescent City, device for lifting goods from shelves; Egbert Judson, S. F., dynamite; Elizabeth J. Lincoln, S. F., portable ash-hasket; Fannie L. Matson, San Jose, chart-reading and number stand; Henry Muller, assignee of ball to A. Graff, S. F., twine-plug for plance; Denis O'Leary, San Bernardino, ventilator and center-piece for ceiling; Ferdinand O. Stallman, S. F., mechanism for depressing cables at crossings of cable railways; Ada H. Vampelt, Oakland, permutation lock; Ruel W. Whitney, S. F., instrument for copying drawings; Frank E. Williams, Alhambra, appliance for spinning-tops; James B. Williams, S. F., insulating compound.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PUMP.—Geo. E. Dow, S. F. No. 419,248. Dated Jan. 14, 1890. The device consists mainly in a series of single-acting plungers, preferably constructed so as to operate vertically, and they are not less than three in number, so as to maintain an even balance and pressure. These plungers are driven from cranks upon the crank-shaft, which is journaled in the lower part of the containing-case, the case inclosing all the operating parts of the pump. The cranks are set at equal distances apart upon the circle which represents their throw and have a uniform throw or stroke. The number of plungers operating in connection with one suction-chamber and one discharge-chamber, with separate valve-chambers intermediate between the two, and each having valves operated by its own piston, insures a steady flow and a steady and constant resistance to the rotation of the shaft, and enables the inventor to obtain a large range of rotative speed.

ROCK-BREAKER.—Miles B. Dodge, S. F., assignor to Parke & Lacy Co. No. 419,247. Dated Jan. 14, 1890. This improvement in rock-breakers consists of certain constructions and combinations of devices intended to further perfect the machine and increase its durability and strength.

CRUSHING-MILL.—Frank A. Huntington, S. F. No. 419,256. Dated Jan. 14, 1890. This invention relates to that class of crushing-mills in which a vibrating or oscillating jaw operates in conjunction with a cylinder between which and the jaw the rock is crushed or broken. The patent covers several novel features. The machine may be adjusted to any degree of nicety to feed ore or other material to stamps or other crushing devices when regularity of supply is desired, and it performs the double office of a rock-breaker and an ore-feeder.

CONSTRUCTION OF DRAINS OR SEWERS.—Bernard W. Murray, Seattle, Washington. No. 419,277. Dated Jan. 14, 1890. This is a sewer or culvert consisting of a sole or yoke with a central longitudinal depression and grooves or channels in its edges, in combination with

tongued and grooved strips or sections fitted together and laid up to form the outline, said sections being mortised or doweled together at the ends so as to form a continuous passage.

TRACTION ENGINE.—Jacob Price, San Leandro. No. 419,284. Dated Jan. 14, 1890. This patent covers a number of details of construction of traction engines, of which Mr. Price makes a specialty.

ROCK-BREAKER.—Miles B. Dodge, S. F., assignor to Parke & Lacy Co. No. 419,246. Dated Jan. 14, 1890. This invention is applicable to that class of rock-breakers in which one or more reciprocating jaws are caused to move to and from each other while the rock is passed between them, this action of the jaw being effected by means of an eccentric upon a driven shaft, and the eccentric is connected with the moving jaw of the rock-breaker by connecting rods or arms in any of the well-known ways. As all the wear and strain of the work is brought upon the eccentric at one point of its circumference while it is forcing the jaw forward against the material taken between the two jaws, this eccentric soon becomes worn, so as to be untrue, and if the box is left loose it will pound and greatly add to the wear and noise. If under these circumstances any attempt should be made to take up the wear upon one side, the box would be broken on account of the irregular shape of the eccentric. In this invention peculiar elastic buffers are used and serve to hold the cap closely against the eccentric so that as it rotates within its box it will always have a perfect fit, while the cap is allowed sufficient motion to accommodate itself to the irregular shape of the eccentric caused by the unequal wear.

FILTER.—Edward M. Knight, San Mateo, assignor to the Rapid Safety Filter Company of S. F. No. 419,266. Dated Jan. 14, 1890. This is one of that class of filters in which a fibrous or porous material is employed as a filtering material. The patent covers a filter consisting of asbestos cloth or other fibrous material and an exterior coating of filtering medium in the form of paste spread upon the cloth and an exterior cover of wire screen to uphold the medium.

ROCK-BREAKER.—James Spiers and Edgar A. Booth, Fulton Iron Works, S. F. The patent covers several details of construction which are intended to improve and strengthen the machine. Among other features is the method of making the dies. These dies are formed of wrought-iron bands inclosing alternate horizontal layers of wrought-iron and steel bars placed edgewise. These alternate layers of wrought-iron and steel bars are firmly held in place by a band being heated and shrunk around them, or by being forced into the band by hydraulic pressure. The steel bars are hardened, and the wear being greater on the wrought-iron bars than upon the steel ones, the latter will be slightly elevated above the surface of the wrought iron, forming a corrugated surface and producing a better crushing effect. The wrought-iron and steel bars, by being set upon edge, present the grain of the metal to the substance to be crushed in a manner calculated to insure long wear.

FLEXIBLE SHAFT COUPLING.—Frank W. Bidley, S. F. No. 419,241. Dated Jan. 14, 1890. This is a flexible or universal coupling for shafts whereby they may be made to run in different lines without breakage or accident. The device is valuable for milling and manufacturing purposes where it may be desired to run shafting at different angles. It may also be applied in steamers of light draft where it is necessary to incline the shafting in order to submerge the propeller sufficiently, as by means of this coupling that portion of the shaft with which the engines are connected may be maintained horizontal, while the portion carrying the propeller may be inclined as much as is necessary to submerge the propeller. This device is placed forward of the thrust-bearing of the shaft.

CLIP FOR WIRE ROPEWAYS.—Bartlett McIntyre, S. F., assignor to the Vulcan Iron Works. No. 419,466. Dated Jan. 14, 1890. The invention relates to that class of devices which are used for connecting a load with a traveling cable and known as "clips for wire ropeways," forming part of a system of transmission of loads from one point to another. The invention consists in the novel construction of the clamping-end of the body portion of the clip, and also in a peculiar joint in the hanger. The object is to provide a clip having a simple, effective means of connection with the traveling cable. Another object is to provide a joint or hinge which will enable the clip to ride over its supporting sheaves.

BOTTLE-STOPPER.—James M. Schofield, Merced. No. 419,477. Dated Jan. 14, 1890. This invention relates to that class of bottle-stoppers which are more particularly applicable to bottles from which the regular corks have been removed during the period of use of the bottle. The object of the invention is to provide a simple and effective stopper of this class which is adapted to be readily inserted in the neck of the bottle and there confined, and is easily removed therefrom.

ORE-FEEDER.—Philip Hinkle, S. F. No. 420,424. Dated Jan. 28, 1890. Ore placed in the hopper will fill it, and a portion flows out through the mouth on to a swinging or

oscillating tray, and when by this oscillation it runs forward another portion of ore will move out on the tray. When the tray has again moved backward, a transverse bar prevents the ore moving backward and will force it forward over the edge and into the crusher or stamps. The movement of the tray is subject to regulation.

Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

TUBBS CORDAGE CO.

(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

AMALCAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Orying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❖ BOILERS HORIZONTAL. VERTICAL ... AND SECTIONAL ...

IMPROVED STEAM STAMPS

Holting Engines,
Safety Cages,
Safety Hooks,

ORE CARS, WATER & ORE
BUCKETS,

Air Compressors,
Rock Drills, Etc.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE ORIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Olobe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Feb. 6, 1890.

With generally fair weather in this State the past week, trade shows a decided increase, with the volume of goods going out on orders larger than at any time within the past two months. It now looks as if merchants' expectation of a liberal trade this spring will be more than realized. Manufacturers look forward with a certainty that they will have a more prosperous season this year than has been enjoyed for several years; this applies more particularly to foundrymen, machinists and iron-workers in general.

The money market continues to grow easier, and now with general trade and inland transportation resumed, much more ease is looked for before the month passes. There are now no idle men, unless from choice, as the call for day laborers has well cleaned up the supply. Dividends disbursed in this city in last month compare as follows with the disbursements in January, 1889:

	1889.	1890.
Banks.....	\$522,000	\$562,256
Cas companies.....	74,500	68,250
Water companies.....	62,500	19,500
Insurance companies.....	84,000	67,000
Street railroad companies.....	25,000	12,500
Powder companies.....	27,000	37,500
Sugar companies.....	36,000	80,000
Mining companies.....	259,250	219,500
Miscellaneous companies.....	81,250	40,250
Totals.....	\$1,120,000	\$1,107,055

In addition, the savings banks of the city disbursed in cash or credits to depositors and stockholders about \$1,400,000 last month. The interest disbursements by incorporated companies, cities, counties and State were unusually heavy in last month.

S. H. Brooks, Assistant Treasurer United States at San Francisco, reports cash on hand Jan. 31, 1890, as follows:

United States notes.....	\$ 66,438 00
National bank notes.....	5,235 00
Gold certificates.....	2,040 00
Redeemed gold certificates (Series 1888).....	100,000 00
Silver certificates.....	112,000 00
Gold coin.....	40,950,400 00
Standard silver dollars.....	18,237,141 00
Fractional silver.....	6,403,793 80
Minor coin.....	6,743 14
Total.....	\$65,914,390 94

The shipments of silver from the Sub-Treasury into the interior of the State and elsewhere for the month were as follows:

Standard dollars.....	\$75,650
Fractional silver.....	14,105
Total.....	\$89,755

MEXICAN DOLLARS—The market continues dull under light buying. The only export buyers in the market for the steamer that sailed on Tuesday for China were Chinamen, and they only shipped \$70,245. The market has ruled weak at 75½¢/76 cts., closing 76½¢/76 cts. to-day.

SILVER—The market has been dull throughout the week, in the absence of export buyers and light receipts of bullions. Now that the snow-blockades are raised, receipts are expected to increase. The silver market continues weak the world over; doubtless this is largely due to the statement of Senator Teller, a strong bimetalist, that President Harrison will veto any bill for the free coinage of silver, and also that the bimetalists in Congress are opposed to the Administration (Secretary Windom's) bill, or to any bill not giving full recognition of silver by which it will be placed on a par with gold. The impression appears to be, judging from our leading Eastern exchanges, that there will not be any favorable legislation at this session of Congress. The latest silver bill introduced is that by Senator Cockrell, on January 27th, amending the Act of Feb. 23, 1876, and authorizing Secretary of the Treasury to purchase silver bullion at the market price thereof not less than \$5,000,000 worth per month, to be coined monthly, as fast as purchased, into standard silver dollars. The bill provides that when the Secretary of the Treasury cannot purchase such silver bullion at a market price less than 99 cents for 412½ grains of such silver bullion of standard fineness, that such bullion shall be received and disposed of in like manner as gold bullion. The bill repeals all laws authorizing the issue of gold certificates and silver certificates upon the deposit of gold coin or standard silver dollars, and authorizes the Secretary of the Treasury, upon the deposit with the treasurer or any superintendent of mints, by any holder of gold coin or bullion or standard silver dollars, when the market price of such silver bullion is not less than 99 cents for 412½ grains, to issue therefor in the denominations now authorized coin certificates. The bill also authorizes the Secretary of the Treasury to cancel and destroy all existing gold and silver certificates as fast as they are received by the Treasurer, and to issue in lieu coin certificates of like denomination for the gold and silver certificates so received.

Confirmed reports were received by the last arrived steamer from Hongkong that the Chinese Government is formulating a plan for coining silver. In the local market the only buyer the past week has been the Mint. The price paid was 97½ cents up to February 3d, when it was dropped a quarter of a cent; that was followed by another drop of a quarter of a cent on to-day (Thursday). Very little bullion is offering for sale. The Carson Mint takes about all that is turned out by the Comstock mines.

QUICKSILVER—Receipts the past week aggregate 62 flasks, and the exports by sea 41 flasks to Mexico. Continued bad roads are against shipments from the mines. The market holds strong at all figures.

COPPER—The Eastern market fluctuated to lower prices, but at the close it appears to be steady. The decline was largely due to foreign advices that buyers having their wants met by deliveries from previous contracts were not operating, and consequently any forced sales were met by lower bids. In their January circular, James Lewis & Sons, London, say: "The stocks continue steadily to decrease, both those of which returns are made in England and France and also those held in France and in the United States in private warehouses by the bankers who took them over from the late syndicate. About 9000 tons have been sold by these bankers during the past month, including 3000 tons

of lake ingots lying in New York at 14 cents per pound, or 66¢ 10s. per ton, with 2½¢ per cent discount. We therefore now consider that in the nine months which have passed since the collapse of the French syndicate, the stock then held on their account has been reduced from 179,000 tons to about 110,000 tons, the reduction in the public stocks being 25,000 tons, or from 118,000 tons to 93,000 tons, and in the "invisible" stocks 44,000 tons, or from 61,000 tons to 17,000 tons.

A Franco-English syndicate has been formed to work the Torre de Capdella copper mine. It is said to be one of the best mines in Spain.

LEAD—The market has been essentially unchanged.

TIN—The exports by sea the past week aggregate 108,000 lbs. of plate to Victoria, B. C. The market for spot continues heavy. For shipment no business can be done, owing to our market being below English parity. The foreign market shows considerable activity, with about all the weak holdings cared for. The demand from the United States is reported as being light.

BORAX—Receipts the past week aggregate 250 cts., and exports by sea 22,621 lbs. to New York and 100 pounds to Mexico. The market is reported firm in sympathy with the East.

LIME—Receipts the past week aggregate 1000 bls., and exports the past week 700 bls. to Honolulu. Owing to fair weather the local demand begins to show signs of increasing.

ANTIMONY—Eastern mail advices report lower prices and a weaker market due to freer importations.

IRON—The pig-iron market is quiet but firm, owing to prices being below the parity of the primary markets. A leading New York paper says that President Clark of the Thomas Iron Company is as bullish as ever, and he says the company could have sold twice its products for the year 1890 to its regular customers and to an English syndicate. An English house offered \$20 per ton for every ton of iron the Thomas Iron Co. could produce this year, and to pay cash monthly whether they took the iron or not. Mr. Clark refused, and has sold 170,000 tons at \$18, \$19 and \$20, and says he would not sell a pound now under \$2 advance on these prices. The odd fact this year is the big demand for No. 2 iron. "You can say that the Thomas Iron Company is out of the market for all grades of iron for the year 1890." In the last six months the company sold more iron than it ever did, and made more money.

Foreign advices report Glasgow merchants bearing the market so as to fill their contracts at lower prices, which causes consumers to fight shy of the market; but, on the other hand, that some South Wales capitalists have combined to keep the market up, if not advance still higher, so as to unload their large holdings at a profit.

COAL—Imports the past week aggregate as follows: Newcastle, N. S. W., 1738 tons; Nanaimo, 2515; Comox, 4300; Departure Bay, 1250; total, 5803 tons. The market is being well cleaned up of English coals, and as there are now some of the brands on the way, quotations will probably be dropped soon. The tonnage on the way from Newcastle, N. S. W., continues to grow beautifully less. The prices for Australian for shipment precludes business. The spot market for all grades is reported unchanged, last week's report covering the situation this week.

Eastern Metal Markets.

By Telegraph.

NEW YORK, Feb. 6, 1890.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	44 1/2	97 1/2	\$14 55	\$3 82 1/2	\$21 10
Friday.....	44 1/2	97 1/2	14 25	3 82 1/2	21 20
Saturday.....	44 1/2	97 1/2	14 25	3 82 1/2	21 36
Sunday.....	44 1/2	97 1/2	14 15	3 82 1/2	21 15
Tuesday.....	44 1/2	97 1/2	14 15	3 82 1/2	20 80
Wednesday.....	44 5/16	96 1/2	14 20	3 82 1/2	20 80

NEW YORK, Feb. 6.—Refined California borax, \$5@9c; steady. Quicksilver—Nominally \$8@70c. Limited sales of ingot copper. The large consumer seem well stocked and disinclined to buy ahead. Speculative interest extremely tame. Mining companies offer indifferently. Quoted prices, 14¢ for lake ingot, 13¢ for common casting. Outside lots could be secured for a shade less. London cables again lower; merchant bars, 24 1/2 1/8. P. D. spot; 250 lbs for futures. Pig lead very quiet, and is without a new feature of any kind. About \$3.85 is the general price for prompt and near future deliveries.

Mining Share Market.

The remarkable strength exhibited by the Comstock shares throughout the month of January has been a source of fruitful remarks from outsiders who have been led to believe that lower prices must obtain. The very close money market has kept a large class of outsiders from buying, while the hard times compelled many having stocks paid for to sell either part or all, and yet the market absorbed every share sold without going lower. The suspension of work in about all the mines on the Comstock, particularly in the Gold Hill group of mines, from Jan. 17th to Feb. 4th had its unfavorable influence on the market. Now that the weather has moderated in Virginia City and the railroads have commenced running, work in the mines has been resumed, with ore being extracted from the bullion-producers. Inside producers are put out for lower prices, claiming that Col. Mackay and Commodore Flood are so loaded up with stocks that they are unable, for the want of money, to make a deal. When stocks were up a year ago the points then were that Col. Mackay and Commodore Flood were selling short on everything along the line, and that ex-United States Senator Fair and General Alvinza Hayward were buying so as to corner them, and the advice was to hold your stock, for "Uncle Jimmy" would make them smell sulphur. Now that stocks are down, do not buy, for Colonel and Commodore will have to unload, when down goes the market as badly as George Miller, the stockbroker, went with his wife while out huggy-riding. In outside stocks the Tuscaroras, to keep up with the times, were nearly snowed under by the bears. A report is now current that Commonwealth will pay a dividend in next month, so as to offset the assessments that will have to be levied. The Quijotas and Bodie were very quiet at black-board prices. The report is still current that Bodie is to be assessed soon.

From the mines private news is still scarce, due to work during the recent heavy snowstorms having been suspended in the more promising mines on the Comstocks. Official letters received to-day (Thursday) report that work has been resumed, and that in both the Alpha and Con Imperial north drifts they are in ore, which, in the former mine, shows an improvement, from Overman, Seg. Belcher, Crown Point and Belcher our advices are of a more flattering character, as are our advices from Hale and Norcross. The grade of ore in the latter mine continues to improve. Taking our advices as a whole, they are more favorable than have been received for several months past. From the Tuscaroras reliable advices are slightly more favorable, yet hardly enough to deserve special mention. The Quijotas continue to send along good news, which is directly opposite from the action of the stocks. Official letters from the Bodie are of the same stale, barren character they have been for a long time past, but reliable private advices are of a more hopeful character, as the work of the mines progresses. In Bodie several levels are being opened up for more active prospecting work, which will be carried on under the supervision of Acting Superintendent John W. Kelly. Experienced mining men in Bodie do not now appear to be discouraged and speak very hopefully of the future. What they ground their faith on our correspondent does not say, but intimates that it is the favorable work going on in one or two of the mines.

THE Technological Society of the Pacific Coast will meet at its rooms, 408 California street, on Friday, February 14th, to hear a paper by Rose E. Browne and H. C. Behr on "Dr. Pohl's Air-Lift Pump."

and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY. 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentees and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of hydraulic Mining Machinery sent on application.

The Pittsburgh Boiler Scale Resolvent.

This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & Co., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, } PITTSBURGH, PA. WORKS AT BRADDOCK. } Oct. 4, 1887. }

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is had. Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT }
{ PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

If in want of Machinery of any description, write us for Descriptive Circulars and Prices.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further informatio apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), London, October 8, 1888.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. Tho fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal. }

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1888.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:
GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

VAN DUZEN & TIFT, CINCINNATI, O.

I. S. VAN WINKLE & CO.,

Importers and Dealers in

IRON, STEEL, HEAVY HARDWARE, CUMBERLAND COAL, PERKINS AND BURDENS
Horse and Mule Shoes, Putnam, Globe and Northwestern Horsehoe Nails, HARDWOOD LUMBER AND WAGON
MATERIALS, Blacksmith and Carriage Makers' Supplies.

SOLE AGENTS FOR THE WELLS RUSTLESS PIPE AND FITTINGS,

Specially manufactured for use in Artesian Wells, and for conveying water charged with Salts and Minerals, Acids,
Gases or other substances of a corrosive nature. In building it takes the place of either black or galvanized piping
or gas, water-waste, etc. Catalogues and testimonials, from large users in the United States, sent on application.

413-415 MARKET STREET, SAN FRANCISCO.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with
Crusher, Blower, Boiler, Pumps, Engines, Tools, and
everything complete for immediate delivery, and only
used about six months. Cheap for cash, or will exchange
for interest in a Lead-Silver Mine, or erect in any mining
camp that will guarantee a certain output. For further
particulars address Box 28, Elkhorn, Montana.

The Fulton Rock-Breaker.

A patent was secured this week through the MINING AND SCIENTIFIC PRESS Patent Agency for the Fulton rock-breaker, which embraces several new and valuable improvements in this class of mining machinery. The old form and principle of the Blake machine, of a central oscillating pitman, transmitting its motion to the moving jaw through toggle jointed plates, is retained, and in the Fulton rock-breaker the Blake movement will be found proportioned and applied in the best form called for by practice. The Fulton Iron Works of this city claim no improvement on the Blake principle, but have endeavored in designing their new machines to render the wearing parts more accessible and easier renewed, and also to make such improvements in the manufacture as increase the wearing qualities.

Fig. 1 of the engravings shows the rock-breaker with stationary jaw closed and ready for work. Fig. 2 shows the jaw open to allow

of the die, and holding it firmly in place when side bars are tightened. It will be seen from this that no bolts are required for holding the die in place; and consequently new bolts of a special pattern have not to be provided every time a new die is put on the jaw; and when the jaw is lowered it is only necessary to slip off the old die, replace it with a new one and swing back into position. The cheek-plates can also be easily renewed when the stationary jaw is lowered; and the movable jaw can be swung entirely clear of the frame and a new shoe fitted to it without taking its supporting shaft out of its bearings.

The section of the upper part of pitman in Fig. 3 shows a simple and effective device for preventing the pounding and consequent heating of this important bearing when the eccentric shaft has worn out of round, due to the strain upon it being constantly in one direction. A spring is placed beneath the loose habbitt-lined gih bearing against the lower part of the shaft; the tension of the spring, and consequent-

Fig. 2.—ROCK-BREAKER WITH JAWS OPEN.

easy renewal of the shoe, die and cheek-plates when they become worn. Fig. 3 is a sectional view taken through the center. The numbers on the latter cut refer to parts which it is unnecessary to detail here.

As will be seen, the stationary jaw is rigidly held in place in Fig. 1 by means of flat iron bars having eyes forged on their ends, slipping over shafts in top and bottom of the jaw. By taking out the pins in the ends of the upper shaft and loosening the nuts holding them in tension at back of rock-breaker, the upper bars can be slipped off and the jaw pivoting on the lower shaft can be opened and lowered as shown in Fig. 2. The die, when jaw is closed as in Fig. 1, is held in place by its edges abutting and being tightly held against the cheek or wearing plates on the inside of the rock-breaker. These cheek-plates have strong hubs cast upon their sides which fit into corresponding holes in the side frames, thus allowing them to accommodate themselves to the edges

Fig. 3.—SECTIONAL VIEW OF FULTON ROCK-BREAKER

ly its pressure against the gih, is regulated by a wedge placed beneath and adjusted by means of nuts on outside of pitman. In this way all lost motion is taken up and both pounding and heating prevented.

A fair idea of the construction of the shoe and die may be obtained from Figs. 2 and 3. They are composed of alternate layers of wrought iron and hardened machine-steel bars placed on edge and held together by a heavy wrought iron band shrunk around them. The iron being softer than the steel, wears away more rapidly, causing the shoe and die in a short time to present a corrugated surface to the rock and giving a better crushing effect. The surfaces of the iron bars do not wear but a short distance below those of the steel, being then protected by them, and obliging the hardened steel to do most of the work, which it is far better calculated to stand. There is no danger of the bars becoming loose and falling

(Continued on page 119.)

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

The Golden City Mining Company.

EDITORS PRESS:—Being largely interested in the mining industry of this State, and particularly in connection with the Golden City Mining Co., of which I am Secretary and a member of the Board of Directors, I should like to have all those who are interested in these and similar industries know what our prospects are.

The company was incorporated on the 23d of July, 1889, under the general laws of the State of Oregon relating to private corporations, with a capital stock of \$1,000,000, divided into 1,000,000 shares. For certain reasons those interested in the mines to develop which this company was incorporated, the directors on the 30th of November, 1889, filed supplemental articles of incorporation increasing the capital stock of the company to \$3,000,000, divided into as many shares.

The stock of the company is now assessable, and the directors have ordered that the stock be sold at the market price, which at the present is ten cents per share, and a sufficient amount thereof be disposed of to put in the necessary machinery to develop and operate the mines to a paying basis.

There is no difficulty in disposing of stock on the aforesaid terms, and we feel confident that with the sale of a half-million shares we can put in such machinery as shall be required.

The company own 11 large gold and silver-bearing quartz ledges, all of which are situated within a radius of two miles and about 60 miles from Albany, the route from here being over the Oregon Pacific Railway to Gatsville, or Rock Creek, the latter being the name of the postoffice at that point, and thence by trail 20 miles to the mine, in the old Sentim or Quartzville district.

Some years since there was a good wagon-road into the mountains to this mining district, but years of disuse and fallen timber have rendered it impassable except with pack-horses, though the writer is informed that last fall the road to within three miles of Quartzville was passable for wagons.

When spring opens a good wagon-road will be opened and rendered passable, so that the mines in this district will be easily accessible. The mines of the company have been prospected for the past year, and assays from the ore taken therefrom disclose high-grade milling ore, which varies in richness from \$4 to \$400 per ton in gold, and with traces of silver. From the accessibility of mines, the size of ledges and the ease with which the ore can be worked, we may, without presumption, predict that these mines will in a very short while be considered desirable properties.

Albany, Oregon. L. H. MONTANYE.

A Big Gold Ledge.

EDITORS PRESS:—The Grunter mine is situated at Shoup, Lemhi Co., Idaho, on the Salmon river, and a short description may be of interest to mining men and capitalists, and perhaps benefit some one now or in the near future. This mine is owned by original locators. The country rock here is principally granite, with two large dykes running at right angles to each other and plainly traceable for miles; one is bird's-eye porphyry and the other blue eyenite. The latter has a southwest course, and forms the hanging-wall of the vein. The ore crops out about 300 feet above the river, and dips south at an angle of 75 degrees with the hill and toward the river, which makes it easy to develop. There are open cuts run at short intervals along the croppings for 600 feet, which show some very fine honey-combed and sulphureous ore; then they come down the hill 75 feet and run an adit across the vein 50 feet, which is made up of hard white quartz and ledge matter carrying from 3 to 15 per cent sulphureous, and assays as it comes out of the vein from \$10 to \$50 per ton in gold. The best streak is on the hanging side, and is about 10 feet thick; there is a drift run east and west on this streak about 100 feet each way, and at the face of the west drift there is a raise put up to the surface, which shows some high-grade ore and a well-defined wall throughout.

The next adit or tunnel is 180 feet lower down the hill and runs through about 75 feet of surface and eyenite before coming to the vein; then they drove a short drift west, which shows the ore to have the same true course and pitch as in the level above; but the good quartz is divided into smaller seams. From the hanging-wall to the present face of the tunnel, which is driven directly at right angles with the course of the vein, it is just 200 feet, the whole mass of which is a highly mineralized vein matter that will average about three per cent sulphureous. There are also five or six seams of clean quartz and iron at intervals along the tunnel, that vary from a few inches up to 4½ feet in thickness, and assay from \$10 to \$200 per ton. The smallest assay taken from drill-holes a few feet apart along the side of this tunnel gave \$4 per ton, and the face assays \$10. I think the whole business would average \$6, and it is safe to say that there is 500,000 tons in eight, although it is not actually blocked out by drifts and ore-cuts. The fact

that there is a short tunnel run into it 300 feet east of this one, and a deep gulch 400 feet west of here, which cuts the lead and exposes a big bluff of it to view, suggests a vast deal more.

There is also a mine 2000 feet farther west on this contact developed to a depth of 800 feet. The present owners of the Grunter have taken out about \$30,000, all of which came from above the 75-foot level, and made a very slight impression compared to what is left in sight up there. They worked the ore in an old-fashioned five-stamp mill, which is about worn out, and they are not able to build a new one suitable to handle this kind of a mine, consequently want to sell. It is a good proposition for a company with plenty of capital to work on a big scale. By stripping off the hanging-wall, which is very shallow for a good way below the croppings, it could be worked on the open-quarry system for a long while with a big mill. There is abundance of water-power and timber of all descriptions close at hand. The only setback to the property is its present isolation from a railroad point, which is 110 miles distant, and freight rates are high; but there is strong talk of a railroad coming within 20 miles of here to tap a big timber region, in which event this mine will stand a good show to come into market and make one of the biggest gold-producers in the Rocky mountains. R. BELL.

Shoup, Idaho.

Rains of Fish and Reptiles.

"During the storm Thursday of last week a strange phenomenon occurred in the vicinity of Blanco in this county, it being nothing less than the fall of a shower of fish. The fact of fish falling from the clouds is not an unheard-of occurrence, but fish such as fell at Blanco we never heard of before. They were of a bright silvery color, about two inches in length, and instead of fins they had sharp spines about one-fourth of an inch long where the pectoral and dorsal fins should be. Our informant, Mr. W. H. Crowe, has preserved a couple of them as specimens of great curiosity, as they are unlike any fish he has ever seen or read of."—*Salinas Journal*.

EDITORS PRESS:—Let me add to the above a little from my own observation. In the State of Nevada, in Lander county of that State, in the early summer of 1866, I drove a two-horse team to wagon toward the town of Austin from my then horse-ranch that was 70 miles east of Austin, and to shorten the journey, and as I had no load on the wagon, I followed the old military road, made by Col. Simpson immediately after the "Mormon War" of 1857, which led me over the high summit of Dry Creek mountain down to and across the head of Smoky Valley. I was going westward, and at the west flank of Dry Creek mountain there was a heavy body of Pinon pine trees where charcoalers were extensively burned for roasting silver ores in Austin. As I drove out of Smoky Valley, I mounted the low, wide, gently-sloping foot-hill of the Toiyabe mountain, which is thinly clothed with small Pinon and Janiper trees, and there in the wagon-road, through the trees, I overtook two long ox-teams, drawing two wagons, each piled high with sacks of charcoal, driving in procession, and as I was in no desperate hurry and could not very well drive past, I brought up the rear of the procession. As we slowly, very slowly, crept forward, I observed that away toward the top of Toiyabe there were dark, cloudy signs of elemental disturbance, albeit down where we were the earth was dry as the dust of Egypt, and the sun painted shadows on the desert. There came a swish of cool, almost cold, wind through the trees, and immediately after that I heard the forward teamster shout, in the true Misourian accent:

"Whoa—back!"

That had an effect that stopped the procession and caused the rear teamster to ask:

"What the —'s the matter?"

"Jist come yere and I'll show ye." And the Misourian stood leaning on his gad-stock, looking at the ground, and onreing in about seven different styles of profanity.

When the other driver and myself stood beside him, the three of us beheld a sight. The dry desert earth for some rods of area was literally covered with toads. If we had been in a toad territory it would not have been so astonishing; but, though I lived and moved and had my being in that section of country for several years, I never saw any toads there but those rained toads, except the horn toad, which is no toad at all. These storm toads were the regular old-fashioned "hop tods" of our boyhood; and these were of assorted sizes from one-half inch to an inch and a half long and "built in proportion."

"Where did they come from?" Go "ask the winged winds that round my pathway roar."

What became of them? They hopped about homeless and died—dried up and blew away like the leaves of autumn.

However, as I drove along same road on my return two days later, I found a county convention of owls in session among the Pinon Pines.

Watsonville.

The Stewart Mining Bill.

EDITORS PRESS:—I have been taking the views of all the miners in this district on the Stewart mining bill, and I have to find the first indorser. It is generally claimed that the laws are good enough and thoroughly understood; that the legal points have been settled

by the courts at great expense, and a new law such as proposed would open up a new field for litigation at the expense of miners.

The feature of prohibiting a person forever from relocating a claim once abandoned is much deprecated, but the one forbidding a person from locating more than one claim on the same vein is the most absurd of all. We all sincerely hope that the bill may not become a law. CHAS. J. BARCLAY.

Gibbenville, Idaho.

Traction Engines.

EDITORS PRESS:—Mr. W. C. Stevens of Chloco seems to have made more thorough inquiry regarding traction engines than any other man I have met. Like most other farmers, he is satisfied that the problem is solved and horses must go, but that the particular method of applying steam to the work is yet a matter of some experiment. He commissioned his brother, O. Stevens, of Clear Lake, Iowa, to visit all leading fairs last fall. This gentleman is a thorough, practical engineer and was very careful in his investigations, as his business letters and the 18 catalogues sent clearly show. W. C. Stevens himself personally visited all outfits of the kind in operation anywhere near Chico. O. Stevens reported that there were many good engines shown, but most were designed to propel themselves and threshing outfit and only very few had attempted steam plowing. He was particularly pleased with the plowing outfit of the Peerless, made by the Geiser Manufacturing Company. There seemed to be a question about stopping the engine to prevent wrecking plows where stones or stumps were struck. He saw them run the engine on top of a 4x4 scantling and stop there. They are made to turn very short corners. The letter did not deal with the materials and workmanship of the different engines so thoroughly as we should have wished. Durability in design and construction are the important points for California farmers. This is no gingerbread country for farm machinery. A machine may look pretty in its holiday paint and varnish and work smoothly on exhibition. When you come to plow adobe summer-fallow in April and May, or drive a harvester through grain that will yield 20 sacks per acre, you don't want a machine liable to break in any part, and especially if that part is some little costing that you must send away off for and possibly get one that doesn't fit when it comes. You don't want an insulator that the very elect cannot understand and that is liable to leave you a dry crown sheet when busy attending some other part of the work and thinking your insulator was all right. You don't want to stop at the top of every little knoll to pump your boiler full of water, or else run the risk of water all running to the front of the boiler, leaving crown sheet dry and causing an explosion when you strike level ground again. You want to put just as little strain on your drive-wheels as possible. It must be enormous at best, especially where you are sometimes called upon to throw nearly all the weight of engine, boiler and water tank on one wheel. Your bed wants to be rigid and your boiler tubes cannot be any too strongly fastened if the engine is to run night and day over all sorts of rough ground for 15 or 20 years.

Medium-Sized Engines.

It becomes a serious question whether our makers have not started out to build too large machinery at first. Is it not a fair way of looking at it to say that the machine should be adapted to the work, when you have thousands of acres of practically level land, generally so hard that a loaded wagon will scarcely make a track, no matter how large your engine? Take the average farm, some knolls, some sloughs, considerable turning, land sometimes soft in places, now and then a tree, stone or stump. It seems to these gentlemen as though a 16 H. P. was large enough for common use. Be satisfied with six 14-inch plows. Drive at 2½ miles per hour and you get a fraction over two acres every hour. Put on your headlights and double crew and you are getting in the 24 hours about as much work as you used to get from a hundred horses, and you stop feeding as soon as you stop plowing. When you come to harvest, no matter if you cannot drive more than a 12 or 14-foot harvester and sometimes have to take a little narrower swath where grain is very heavy, you can keep on at night until the grain gets too damp and make a good showing if only you have a machine that doesn't break down. These big machines make a great show on paper. We want the machine that will make the best showing in ten years' work in the field. Some have boilers too small and will run very well for 200 to 300 yards and then stop for breath just as the mules do on hot days.

Engines for Orchards.

Some two years since, a friend suggested an engine for cultivating a large orchard. It seemed visionary at first. Suppose the orchard has 200 acres or more and is practically level. Why not? If you are to keep up with the times, you must go over it once or twice a month from six to eight months. Leave a turn row at the end, and there is no question but that you can get around. Your engine will never bite a tree; your whiffletrees will never bark one. If an engine costs less than half what the horse cost to pull a plow in a wheat-field; if the fuel costs less than half the feed; if

it takes two men instead of six to plow six furrows, then why not an engine in an orchard?

Suggestions for Makers.

When you come to cultivating your trees, remember that the spring tooth is a success and that the Gale seeder has a good frame for carrying them. If you want to stir the ground on the Hetch system, the tooth must be made heavier, and it needs an extra point anyway, made of harder steel. Fix the lower end of your tooth to fasten it on so that your points can be renewed when worn. If you are stirring the ground away down and don't want to draw that two-inch surface against the dirt, take a half turn in your tooth before it is tempered above where it enters the soil, and another at the lower end to make a seat for your point. If you want to turn weeds under when they are little, make a reversible mold-board to go on your tooth large enough to turn a 3x6-inch furrow. Your spring will relieve it from any danger of breaking, no matter what you strike.

If you want to use the same thing as a seeder, you have the prettiest kind of a device for covering grain in these little plows. You can do a row of tress at a time with such a tool and your 16 H. P. engine, even when you are stirring that very loose dirt late in the season 12 inches below the surface to keep up the moisture, and shame the irrigators.

The Chico Engine.

Mr. M. L. Mery of this place is building an engine with which he has been drawing, on trial, three 12-inch Peerless gangs, plowing 12 furrows at once. He found the boiler too small, and is now reducing the speed to 2½ miles per hour by using a smaller pinion. He has several very valuable features in his design. He drives his traction-wheels from the rim, thus relieving axles and spokes of great strain that they must bear in the ordinary way of gearing. He also drives the guide-wheel in front, giving him greater power of traction and making his engine easier to turn. He can turn his machine, which is 20 feet long, in a 24-foot circle, and can go over the railroad track so carefully that you hardly notice a jer.

Farmers should do all they can to encourage and foster home industry, thus building up a home market, and consider the durability of the machine and convenience in getting repairs as well as first cost. F. S. CHAPIN.

Professors and Mines.

Of all ancient and honorable titles, this one of professor has certainly fallen into the hardest lines. Webster lines the definition—First, one who makes a public profession, especially of religion—and second, one who professes publicly to teach, especially an officer in a college or university, whose duty it is to instruct or read lectures. Abroad it is restricted to its proper use. In the whole of England there are not more than 30 men known as "professors." In the United States about 3,000,000, from the college down to the corn doctor. From the village schoolteacher, who boards around, gives instruction through the whole range of learning for \$25 a month, down to professor of mathematics, who gets \$2000 a year for teaching transcendental physics only, all wear proudly the grand old title, but it is in mining sections the professor flourishes to perfection. Talk about colonel in the South; why, in a mining section, professors are thicker than flies around the bungalow of an empty beer barrel in summer-time. "Professors" have been the curse of the Black Hills. Every fraud ever floated here has been booked by a "professor," their names would fill a column, and in almost every case the title was self-conferred, scarcely one having been entitled to it by any rule, custom or precedent. "Professor" and fraud have almost become synonymous terms—so much so that you can safely bet that any man coming into a mining section dubbed professor will bear watching. The Pioneer gives the advice to all reputable mining men who value reputation to "shoot" the "professor."—*Black Hills Pioneer*.

THE CHARLESTON.—Commodore and Acting Rear-Admiral George Brown of the North Pacific Squadron has announced his intention of bringing the cruiser Charleston from Mare Island Navy-yard, as soon as she has completed her fitting and taking of stores, to the lower bay and anchoring her in the stream at some point easily accessible from the water front, in order that the people of San Francisco may have an opportunity of inspecting the first Pacific Coast built man-of-war before she goes to sea upon her first voyage. The first date of her appearance in the harbor is, it is understood, March 1st, and as she will not put to sea until April 1st the citizens of this city and vicinity will have one full month during which to visit and inspect the new cruiser, which, as the first warship ever built upon this coast, should be an object of interest to every one having Pacific Coast interests and industries at heart. While in the harbor a daily detail of officers will be made whose duty it will be to explain to visitors all matters appertaining to the working of the vessel and her batteries.

THE town of Burke, Idaho, in Cœur d'Alene district, had a snowslide last week, when three men were killed. The Custer mine, on Nine Mile creek, had a snowslide at its boarding-house, where six miners were killed. Other avalanches have occurred in the same region.

Not All Fancy.

Without any violent stretch of fancy, we may anticipate that the old proverb that every cloud, however dark, has a silver lining will find an exemplification in the coming season. We are just emerging from a long, dreary spell of bad weather—an unusual downpour of rain and snow that has greatly deranged travel and transportation and inundated the ranches and lowlands in the immediate vicinity of rivers. Business in the towns and cities has been largely depressed, and crowds of idle men thronged the street and every niche and corner where they could find warmth and shelter. So great has been the distress that the poor have suffered for fire, food and other necessities, and free lunches and free lodging-houses have been temporarily established for the assistance of those who were willing to work but could find nothing to do.

And yet we may assume that this long stretch of bad weather will not turn out to be an un-mixed evil, for, while it has quickened the humanity of the well-to-do people, it may also be regarded as the harbinger of a most prosperous year. In spite of mud and rain and the sneezing of la grippe, it means a mine of wealth for every section of the State, the contribution of all that goes toward making a thrifty community and happy people. It means that the mine will be filled with the gold and silver products of the hills and mountains and the huge warehouses with hundreds of thousands of tons of grain. It means a general activity of men and horses, barges, steamboats, foreign ships and miles of freight cars, and bright, busy and joyous energy everywhere.

There is really no good cause for moody complaint or gloomy forebodings. The paroled scil, especially in some of the more arid valleys, needed a thorough soaking, and the springs and wells that had well-nigh failed will abound and flow with an abundant water-supply. The whole State will exult in the refreshing baptism, the deserts blossom as the rose, the hills and mountains leap with gladness, and the orchards and fields, vines and young trees clap their hands with joy. Plowing and pruning for a few weeks may be retarded, but in a climate where the season for labor is so long and reliable, a few weeks' delay need cause no alarm.

In short, while there is no need of disguising the fact that there has been a considerable loss of property, the wheat crops in some places destroyed, a few orchards badly damaged, the aggregate result of the immense rainfall means a year of splendid results. The money channels will be fresh, and men who are in debt will be able to pay and feel free of that ugly incubus. They will be able to improve their farms and homes, and in various ways carry out the plans they have long entertained for the pleasure and comfort of those they love. The country homes will be made more cheerful with vines and shrubbery and rare exotics; with books, music and pictures, and all that pleases the eye or regales the taste. Even fences, highways and bridges will feel the impulse of the good times, and the land be blessed with better schoolhouses, churches, and other public edifices.

In the cities, the great distributing centers of the State, labor will be more likely to find employment, and employers will feel more hopeful and generous. Poverty will in some measure lose its most powerful and mortifying sting, and as a result we may hope that the calendar of the criminal court will be less crowded. With the stir of the expectant and enlivening times, those who have the charge of the health, comfort and sanitation of the various towns and cities will be encouraged to go ahead with their plans of improvement, perfect sewerage, more permanent and cleaner streets and all other things that make for the general good.

Now we feel sure that this picture is not all fancy; is really but a faint outline of the joyous prosperity and happiness that will soon burst upon us, whatever a morbid and grumbling pessimist may say to the contrary. And surely no one can deny that if all the blessings enumerated above should take place, the State, with all its charms, would be a more inviting abiding-place, and health and morals greatly benefited. The advent of active business will be upon us in a few weeks, and we may just as well anticipate it by a general cleaning up. In the city much may be done for imperfect sewerage, bad sidewalks, dirty streets and spots of filth; and in the country, aside from the work of the eye and pruning-knife, fences and gates may be repaired, yards and gardens put in order, houses painted, the walks adorned with flowers of all hues, the windows and porches mantled in sweet vines, and the whole country made a picture of beauty and a psalm of praise.

And while we write thus under the witching influence of the welcome sunshine which has been so long withheld, we are not at all un-mindful of the serious individual losses which have been visited upon many of our citizens. We do not forget that some of them have been driven from their homes by the high water which has destroyed their levees, drowned their cattle, and in many cases wrought serious injury to their buildings and fences. Nor do we forget that many a pretty piece of hillside, orchard or vineyard has been gullied or "ploughed off" by the unwonted precipitation. Local injuries have been done which it may take years to repair, and in some cases the burden of tax-

ation will be raised to restore public improvements. And yet on the whole the generous water supply will be a blessing, as we have intimated, and we trust that in the wise distribution of good things, a kind Providence may grant a double share of prosperity to those who have suffered most.

Montana and Michigan Copper.

A correspondent of the *Portage City Gazette* says: "The Lake Superior mines produced in 1889 just about the amount of copper they did in 1888. Can they increase their output very materially in 1890? The Tamarack expects to be producing before the end of the year at nearly double the present rate. The Osceola expects to get out more. There may be one or two mines which will get out less. I do not think of any more from which an increased output is at all certain. Some of the Calumet's competitors say that that great company cannot materially increase its output for some three or four months yet."

"And as to new producers at the lake, there is little to fear. I hear that the Allouez cannot make much copper inside of four months."

"Looking to other copper-producing sections, Arizona maintained in 1889 the production of 1888, an amount hitherto unprecedented. New Mexico can produce more this year than last. All other sources outside of Montana are not important. In Montana the increased production of 1889, as compared with 1888, was over 7,000,000 pounds. But even in Montana, the old producers—the Anaconda and the Parrot—produced less than in 1888. The Boston & Montana produced over 8,000,000 pounds more than in 1888. It will produce even more in 1890. The Anaconda produced 61,647,000 pounds in 1889."

"On the whole, it may be a conservative estimate to allow that, normally, with copper at 14½ to 15 cents, production in this country would increase ten per cent. Outside of the Anaconda, that would mean a total production of 192,500,000 pounds, or 197,500,000 pounds including imported ores. Add 65,000,000 pounds in stock on January 1st, and we have a total supply for 1890, outside of the Anaconda, of 262,500,000 pounds. As notwithstanding the superior market in this country, exports in 1889 have been 82,000,000 pounds, and larger than in 1888, we may safely allow for equally large exports in 1890. These exports reduce the total supply for home needs in 1890 to 180,500,000 pounds. Now, consumption in 1889 was 169,600,000 pounds. It seems to be larger now than ever. How much larger now than in 1889 it is impossible to say. If it is only ten per cent greater, the consumption in 1890 will entirely eat up the amount left to meet the demand, always remembering that no allowance has been made for the Anaconda. From these rough calculations the importance of the Anaconda fire becomes apparent, and until the fire is out and the mine again producing, the copper market will perforce remain buoyant."

THE LATE CHESTER S. LYMAN.—On the 29th ult., Prof. Lyman died at New Haven, Conn., where he had been for many years Professor of Industrial Mechanics and Physics, and then Professor of Astronomy and Physics at the Sheffield Scientific School of Yale University. Prof. Lyman was in California as early as July, 1848, and was one of the first to visit Sutter's mill, where he wrote an account of the discovery of gold for the *American Journal of Science*. In 1850 he went back East, taking with him many nuggets of gold, one of which weighed two pounds. He returned here in 1854, and remained until 1857, going hence to the Sheffield Scientific School. In 1871 he constructed an apparatus for describing acoustic curves, also making improvements in clock escapements, compensating pendulums and other apparatus. Prof. Lyman was the first to observe the planet Venus as a delicate luminous ring when seen in close proximity to the sun near inferior conjunction. Prof. Lyman retained the professorship of astronomy and physics up to the time of his death, although long disabled from performing its duties.

ELECTRICAL SOCIETY.—On the 3d inst. a meeting of the California Electrical Society was held, at which the following officers were elected: President, N. S. Keith; vice-president, Orion Brooks; secretary, W. W. Wright; treasurer, W. H. Hanson; Executive Committee—A. W. Smith, E. A. Roe, H. T. Bestor. The following were elected honorary members: A. G. Davis of Baltimore, Geo. H. Pride of New York, P. B. Cornwall, L. L. Baker and Alvinza Hayward. It was decided to remit the dues for December and January, as no meetings were held in those months.

COPPER IN THE UNITED STATES.—The total production of copper in the United States in 1889 was 241,830,000 pounds, including 236,730,000 pounds from domestic ores and 51,000,000 pounds from imported ores. The total production in 1888 was 232,853,456 pounds. The stock on hand December 31, 1889, was 65,000,000 pounds, against 75,000,000 pounds on the same date in 1888. The Anaconda mine, with 61,647,000 pounds, was the largest producer of copper in 1889. Next came the Calumet and Hecla, with 48,640,029 pounds.

Making Good Citizens.

The annual report of Ira G. Hoitt, State Superintendent of Public Instruction, for the year 1889 shows that there has been expended in this State about 15 per cent more for all purposes in conducting the public schools than during the preceding year. For this increased expenditure the State has to show 218 new schoolhouses, erected during the year, and a daily average attendance of 11,500 more pupils than during the former year. The report further shows an increase of two per cent in the number of teachers who have been trained for the profession in normal schools. On this showing, Superintendent Hoitt may congratulate the people of the State on receiving so large an equivalent for the money expended in the maintenance of the public schools.

Now we may well ask, why should the State go to all this trouble and expense? Surely not as an act of charity. Were this the inspiring motive it would be difficult to know where to draw the lines of limitation to its benevolence. Why not establish clothing stores, soup kitchens or free restaurants in the immediate vicinity of the public schoolhouse? Why not provide bread for the children, as well as books of instruction? The reason should be obvious; the State assumes the education of the children for the purpose of making good citizens of them, to prevent the breeding up of a generation of ignorant or indifferent voters, in whose hands the ballot might prove a frightful weapon of anarchy, of misrule, if not of destruction.

What then may we consider the first and essential quality of a good citizen? "We want thinkers, we want them," said Coleridge, speaking of the religious narrowness and bigotry of his day, and the same stinging epigram is applicable to citizenship in a great republic. We want voters who can think for themselves and who cannot be herded and bell-wethered to the polls; voters who can weigh evidence, who can detect the fallacies of an argument, who possess a patriotic conscience rather than a partisan one, who know the right from the wrong thing and whose ideas of justice cannot be warped and biased by party prejudice or the special interests of a guild or class. While this would be a good thing for any Government, it is absolutely essential to the welfare of a democracy, where every man is a sovereign to the extent of his vote.

For even majorities may become despotic and dangerous. Just as an infinitude of separate fibers may be twisted into a hawser strong enough to hold a ship or pull down a tower, so a sufficient number of individual votes may aggregate into a stupendous power that may shake with the potency of an earthquake the honor and stability of any State or municipality when stirred by ignorance or passion.

And never before in the history of the world was intelligence, as a factor in political affairs, more imperative than now. There are men now living, who, within the limits of their own memory and experience, have seen greater changes in the complexity of our civilization, in the growth of wealth and the methods of production and exchange, than occurred in any 500 years before the present century. Compare the slow settlement of the New World, the 200 years of struggle with the dense forest and the wild Indians, with the rush of enterprise, the din and clang of machinery that came in with the era of steam. Compare the staid, timid commerce of those early times creeping along the rivers on rafts, in flatboats, "broad-horns," or buzzing the shores of the sea, with the majestic steamers that cross the Atlantic within a week, and the locomotive, railroad and telegraph lines that open an empire and build up a city in a day. Think of the tremendous mastery that has been achieved by modern genius over the mighty forces of Nature which are now at work for us in mill, shop and field. Think of the wonderful and perplexing questions that this age has thrust upon us for solution, questions of adjustment to the new environment; wealth running into despotic monopolies; syndicates of trusts that are swallowing up small enterprises, as the sea swallows its ripples; questions of labor, taxation, tariff, immigration, and kindred things thrown to the surface by the new age. We have evoked the fabled geni from his hiding-place, and it remains to be seen whether the possession of its power shall prove a profitable servant or a hideous monster of cruelty and oppression.

Now, these and kindred questions must be met face to face and solved by the men and women who are now being trained in our public schools; and a point that we may seriously consider is, whether these schools are adequately meeting this need of our population. The methods still largely in use of determining the merits of teachers and scholars by book-questions has created the aspersion they are not. No doubt thousands of young men and women are made to believe every year that they have received a good education, when really they are actually helpless in the art of making a living. But there is no great cause of complaint, for no one can read the educational journals or listen to the papers and discussions of Teachers' Institutes and fail to see that our leading educators are fully aware that the educational methods of the past belong to the past, and that no man can be regarded as educated who does not feel the stir and thrill of the spirit of his own age and knows how to make himself at home in it.

Road Work.

There are two seasons when the rural mind is forcibly called to the subject of roads; when he is mired to the hubs in a river of mud and when he is choked with dust or feels his vertebrae snap in buck-holes. Just before the dust forms and just after it is laid by the early rains, the easy-going ruralist is ready to declare that a dirt road is the most comfortable road in the world.

It does seem that this winter's experiences would be enough to overcome the inertia even of the easy-going citizen, and impel him to some effort for better highways. California has some most excellently made and zealously cared-for highways, than which better cannot be found in any farming country, but the leagues of abominable mud streams which now connect our farms and villages are a disgrace to any progressive commonwealth and a decided detriment to prosperity and progress.

We are well aware that it is very expensive work to make good roads in some of our valleys. There is no adequate supply of gravel, and the distance to rock quarries is very great. There are places where the only practicable way to get good road material is to bring it in by train-load. Of course when this is so and the district is sparsely settled, it is hardly within the possibilities to secure a great length of good roadbed. But there are many people in some of our most prosperous valleys owning improved land worth several hundred dollars an acre who can hardly drive outside their own gateways without losing sight of their horses' legs. Such people haul through deep mud all summer and flounder through deep mud all winter, and apparently make very little effort to escape either disagreeable and expensive operation. What little work is done by the constituted authorities is done at the wrong time or in the wrong place, and the resident puts in a good part of his leisure time in growling at the roadmaster.

We would like very much, now that the subject is brought forcibly to attention by existing conditions, to have our readers occupy part of our space in a timely discussion of road-making. If the existing system of road work and road management is wrong and to blame, let us hear all about it, and how to improve it as a branch of the public service. If it is desirable to do away with existing machinery and portion out the road to residents individually or co-operatively, let us hear what has been done or can be done in that way. This project is now being urged upon the Boards of Supervisors in some parts of the State, and there should be something worth hearing to see about it.

Then, after systems are disposed of, let us hear how some of the notably fine roadways of the State have been made and at what cost. Many people do not have very clear ideas how to make a good road, even if they have a good disposition to do it; so let us have plain directions from those who have succeeded in making a good piece of road with different materials, which were available.

There could hardly be a more interesting or profitable subject for discussion, now that there is a good chance to see just what road is good and what is poor, and if we can have the suggestions of a score or two of our practical readers just at this time, it may result in adding hundreds of miles of good roads to our State before another winter comes along.

"ARCHIE" BORDLAND, who died in Oakland last week, was a mining man known all over the coast. He has been in California since 1852 and first worked in the mines in Grass Valley, going also to the Frazer river mines and other "excitements." He went to Virginia City in the early days of the Comstock and worked as a miner in the Gould & Curry and as brakeman in the Savage. He made considerable money in the stock market through the ore discoveries in those mines and in the Yellow Jacket, Crown Point and Belcher, and ceased his laborious work and became a keen speculator. He was one of the largest, if not the largest, outside holder of Consolidated Virginia and California stocks at the time of the discovery of the great bonanza, and these and other fortunate investments and daring operations enabled him to amass a vast fortune. Of late years he has been interested in mines and cattle ranches with Geo. W. Grayson.

THE Bodie Miners' Union elected the following officers at a meeting held January 21st: President, J. M. Donohue (re-elected); Vice-President, G. K. Fitzpatrick; Recording Secretary, W. A. Bradshaw; Financial Secretary, A. P. Cameron; Treasurer, D. J. McDonald; Conductor, Richard Noonan; Warden, M. Currie. Finance Committee—M. L. Virden, W. J. Fitzgerald and Sam Tyack. Board of Trustees—Archie Graham, Alex. Drennan, Angus Falconer, Eugene Fitzgerald and James Glenn.

NICARAGUA CANAL.—A letter has been received in this city from General Boehke, Chief Engineer of the River, Harbor, Canal, Dredging and Land Co., in which he writes that the contract for the eastern half of the Nicaragua canal will be given to an Eastern company and at low figures, as the competition is very great; on the western slope there are no competitors, and that his company can have it at fair prices. The contract is said to involve an expenditure of from \$5,000,000 to \$8,000,000.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR MINES IN NEW YORK.—*Ledger*, Feb. 8: The most phenomenal advance of the week has been in Sutter Creek, which rose from 6½c last Friday to \$1.75@2 to-day. Those owning a controlling interest in the company assert that they have sold enough stock to raise the \$15,000 originally wanted to provide a 10-stamp mill for the property, with water facilities, etc. They claim to have no more stock to sell at any price, and say that this week's advance has been caused by legitimate inquiries from those who have faith in the mine coming upon the market when no stock is to be had. As these orders are as yet unfilled, if buyers persist, it is argued that a further advance is probable. While this may be true, an advance of over 200 per cent, simply on "expectations," particularly in a dull market unmarked by any great speculation fever, is always suspicious. Probably the truth of the matter is, that it was decided that the stock could best be disposed of by making it active and advancing, rather than by selling at a fixed price.

MISCELLANEOUS.—Most of the mines are still kept busy hoisting water. The flow is decreasing, but very slowly. The Zelle mill is running 20 stamps. The Keystone is doing little else than taking out water. The Cosmopolitan mill has been running steadily, and the result of the first cleanup is awaited with much interest. Work will be started shortly at the North Gover. The North Star Improvement Co. is determined to prospect considerably more before abandoning the enterprise. They have paid 16 assessments without a single share being advertised as delinquent.

Calaveras.

WATER SKIPS.—*Mt. Echo*, Feb. 8: Mining men will do well to examine the two new water skips at the Angels mine in this town. They are a positive and ingenious departure from present devices, and indicate superior utility and general excellence. These skips are made of steel one-eighth of an inch thick, and weigh about 1000 pounds each. Their cubic capacity (each) is 54 cubic feet—over one and one-half tons of water. They were built by Thos. Fullen and Cyrus Condo, master mechanics at the Angels mine. The essential and distinctive feature of these machines, or rather vessels, is a door on one side and near the bottom of the skip. This door is so arranged and constructed that it is operated by a lever attachment, automatic in character. On arriving at the surface, or wherever it is ordered to deliver the water, the lever, the end of which is provided with a small roller, moves up an oblique surface, thus opening the water door. The bottom of the vessel is fitted with a 14-inch valve. This discharging of the water is done with less mechanical work and more expeditiously than in the present mode of tipping the vessel.

IMPROVEMENTS.—From the testimony of developments and from authoritative expressions of leading mining men of this place, the public mind admits that this spring and summer will witness the most important and prolonged mining campaign that has ever attended the industrial history of Calaveras. New and larger mills will be built on the great lodes here, and large forces of men employed. The extent and character of several years of intelligent exploitation developments at the Uica, Angels, Gold Cliff and Tulloch & Lane mines, have established positively and effectually the permanency and profitable results of deep mining. Science, brains, muscle and some capital will shortly make the earth yield up its hundreds of thousands. Otto Dolling has commenced operations again on his mine near Alhany Flat. Much is expected from this mine, as the yield of a ton of the ore at the Selby Reduction Works some months since was over \$320. And work since then and until the rains set in developed better ore than that. The width of the lode is not yet determined. Mining experts of ability, as well as first-class practical miners, express the opinion that the Calaveras mine, situated at Robinson's Ferry, is destined to become one of the leading mines of this county. Work is progressing on the Star of India mine near Smith's Flat. The Chicago company now working the property has commenced developments in a business-like manner. The Whittle mine, owned by Mr. Peet, and located near Alhany Flat, is being worked steadily and with excellent results. Work is going on actively at the Lane & Tulloch mine, in the southern part of this town. The mine is yielding good returns.

Inyo.

BORAX.—*Independent*, Feb. 7: M. Bush came in from Saline valley last Monday. He brought along samples of borate of lime from his borax location. This is the richest form in which borax is found and Mr. Bush has one location of 260 acres that carries that kind of material. John Stoutenborough of Bishop, and John F. Miller of Benton, were at Saline last week, and they, together with Mr. Lent, made some locations of borax land. It is understood that Mr. Cox, a Boston man, is an equal partner with the three named before. These parties propose to go over the valley soon with a large outfit for a borax camp. Mr. Bush says Conn & Trudo have a large quantity of borax at their camp all ready for shipment, but there is scarcity of teams.

A GOOD PROSPECT.—The prospect is good for a considerable revival of business at Darwin as spring opens. It is said on what appears to be good authority that Hon. P. Reddy has bought the waterworks and will make a good deal of improvement thereon. Mr. Reddy has already put up two jiggers and these are now being worked on ore from the Defiance. Each machine will work from four to five tons of ore per day. An immense amount of ore is on the dump and more machines will be added. J. A. McKenzie continues shipping ore from the Lucky Jim. J. C. Eddy recently put some men to work in the Promontory and will increase the force there and in other mines as soon as spring opens. C. Anthony has again got the road open up through Sherber's Canyon to the Riley mill and has teams hauling wood. He will be ready in a few days to start up the mill again and a good deal of work will be done there. A few more men have recently been put to work in the

Defiance mine and more would be employed, but there are no idle miners at Darwin. Altogether the prospects for that camp are very good.

CERRO GORDO.—*Inyo Independent*, Feb. 7: At Cerro Gordo the work of timbering Union shaft is reported to be nearly completed. Already, it is said, some men have been put to work prospecting in the mine, and this force will likely be largely increased when the shaft shall be completed.

HAULING BORAX.—*Index*, Feb. 6: Mr. J. D. Marshall of Keeler will put his team at work hauling borax from Saline valley to Alford. The haul is 50 miles and it takes a week to make the round trip.

Mono.

A BIG PLACER SCHEME.—*Homer Mining Index*, Feb. 6: John Elbert, secretary of the old Mono Lake Hydraulic Mining Company, has been in this vicinity for some days, presumably looking after placer ground in the valley between the mouth of Mill Creek canyon and the big lake. Twenty-four claims of 160 acres each have been located and recorded, aggregating 3840 acres. Each 160-acre claim bears the names of eight locators. We are informed that Jack Skewe's re-emption claim and that of Stewart, Loose and Burnside are covered by the new mining locations. These lie immediately south and east of the Locoville, and were taken up as agricultural land. The old Mono Lake Company holds patents for three 100-acre tracts, Callinan's station being on one, which reaches nearly to the great moraine which extends across the canyon this side of its mouth. It is said that a great hydraulic mining scheme is being projected, but whether by the old company or a new organization has not been learned, but as it is said that the above-mentioned locations have been made at the instance of and in the interest of Mr. Elbert, we presume that the old company is at the bottom of the new project.

Nevada.

NORTH BANNER.—*Grass Valley Union*, Feb. 6: The pump of the North Banner mine started up on Tuesday evening, and Supt. Skewes says the water will all be out of the mine by the last of next week. A good deal of water is coming down through the old workings, but this is caught up on the drain tunnel level, and is making quite a strong head. Snow yet lays to a depth of 4½ feet at the mine.

MANZANITA GRAVEL MINE.—The Manzanita gravel mine at Nevada City is to be reopened by sinking an incline in new ground in the eastern portion of the location. The old tunnel will be abandoned on account of the constant caving of the overhanging banks.

THE WATER.—*Grass Valley Union*, Feb. 12: The water in the Empire and North Star mines is now under control, but it was a hard fight to prevent it from getting the mastery. Everything is going on favorably at the Crown Point mine. Wolf creek is now furnishing sufficient power to run the machinery, the accumulated water in the shaft has been pumped out and the work of sinking the shaft resumed. Mining work in the district is being gradually resumed, and the crowds of miners who were kept in enforced idleness for some weeks by the stormy weather are mostly employed again.

Placer.

GOLD RUN.—*Cor. Placer Republican*, Feb. 5: All of our drift mines are abandoned, as no provisions could be got to the miners. The Indiana Hill Co. took their men away from the mine last week. This mine is operated by Chinese and managed by Ti Sing. Many old mountain prospectors and hunters have been driven in on snowshoes by the storm. The snow is 6½ feet in depth on a level.

San Diego.

THE STONEWALL.—*Julian Sentinel*, Feb. 9: The mill was, practically speaking, finished and put in operation the 1st of this month. Mr. C. Lynn, the contractor, and E. Cameron, the foreman on the works, left for their homes in San Francisco. We were out there one day this week, and counted 30 stamps pounding out the yellow dust. We were shown through the mill and hoisting works, and although we are not familiar with the different methods of mining, we venture the assertion that there is not a more complete plant in the State. The owner is justified in being proud of this property. The district should be proud of it. Five years ago this mine was simply a hole in the ground, which at one time paid well, but was supposed to be worked out. It was then in the same condition that dozens of mines in this district are to-day. It only wanted energy and capital to make it the foremost mine in the State. In another five years we expect to see a number of our mines, now idle, equal the Stonewall in richness and production. The mines are here, and capital will come and develop them, and it's coming soon.

Shasta.

OLD DIGGINGS DISTRICT.—*Redding Free Press*, Feb. 8: It is some time since the Old Diggings materialized in the *Free Press*. We have not all been snowed under, but pretty near it. The snow was from 16 inches to two feet deep and did some little damage here. The roofs of several sheds broke down, and Flanagan & Forbes' mill at Star gulch is completely caved in. Notwithstanding the exceedingly bad weather, nearly all the mines are doing something, and we understand that operations are to be resumed at Quartz Hill this week. Somebody with capital will make a big thing out of Quartz Hill some day. Walker Bros. mill is shut down, as the roads are too bad to haul quartz. Superintendent Rippetto has gone to Salt Lake City, but work in the mine is going on, however, driving the lower tunnel. Messrs. Hart & Fleming have been running their mill all through the storm with the exception of a few days when the ore team had to go to town to get some feed. Thompson & Jones have taken another contract in the Mammoth tunnel. Mr. Butters shipped a carload of concentrates from Walker Bros. to his works at Kennet this month.

CALUMET.—A. B. Paul of the Calumet mine went to San Francisco Wednesday morning. Mr. Paul says that the high water in the river did not quite reach the railroad track. He was obliged to shut down the mill for the reason that the foundation to the engine and hoiler became unstable by reason of the seepage water from the hill above.

STRIKE.—*Shasta County Democrat*, Feb. 12: Last Thursday a German prospector made a rich strike near Anderson & Berg's mine, in Lower Springs district. He was out looking for a ledge and came across a gopher hole. He panned out some of the dirt in the hole, and was surprised to find the hot-

tom of his pan literally covered with the "yaller truck." He tried another panful, meeting with the same success. He thinks he has struck a bonanza and has gone right to work on his new find.

ORE.—Anderson & Berg commenced shipping ore from their mine in Lower Springs district Monday. The ore is hauled from the mine to Middle creek, and from there shipped to the Selby smelting works. Some parties have taken up mining claims along the river between here and Middle creek, in order to secure an immense quantity of logs and driftwood brought down by the recent high water. They will have any amount of good stove wood.

LOWER SPRINGS DISTRICT.—*Cor. Shasta Co. Democrat*, Feb. 5: When I reflect upon the immense showing for good times that we have here, why some of the money and labor was not spent in actually developing the mines deeper than mere surface scratching, is really a difficult matter to solve. We have in our midst two reduction works and one or two free mills, and one reduction works is in course of erection; also one other free mill. This mill speculation is a sad one to our mining district. I believe all of the mills in this district are idle; it may be the stormy weather that has so stopped the progress of milling ores in this district. We have about 16 miners and all of them have from two to six mines which prospect well, and we have three mills; one of these has a good ledge, the others have none. The average capacity of these mills altogether is 40 tons per 24 hours. The poor miner has monopolized very near all the paying mines here, and the most of them are too poor, some too lazy, and others too high-priced to allow capital to purchase from them any portion of their property, and as it now stands mostly in the hands of poor men and unreasonably ones, too, our mines here are valueless under the present situation. And what are all of those poor millmen or companies going to do for ore? The mill companies are lost to know just what to do. They simply build up and tear down and replace different kinds of machinery, keeping them in a financial embarrassment, better described as keeping their noses to the grindstone.

Sierra.

AN ENGLISH CO.—*London Mining Journal*, Jan. 12: There has been organized in London a company to acquire and work the Mountain Ledge mines, situated about three miles northwest of Sierra City, on the Sierra Buttes, and in a direct line between the Sierra Buttes and Young America mines, which have both returned immense quantities of gold. The property consists of the Mountain mine, held under U. S. patent, and six claims adjoining, which give a continuous run of about 7000 feet on the course of the ledge or vein which is being worked on in the Mountain mine. There are also millsites on the right bank of the north fork of the Yuha river, together with a water right securing an ample supply for milling purposes. According to the prospectus, the Mountain mine has been well opened from the cap of the ledge to a depth of 600 feet, and is now in a fit state of development to keep a 40-stamp mill in full work, and its further development can be carried on with rapidity and economy. The property was examined in September last by an engineer on the staff of Messrs. John Taylor & Sons, and they estimate that the reserves of ore proved by the development works to exist above the level of No. 3 tunnel amount to 50,000 tons. At the conclusion of their report Messrs. John Taylor & Sons say that "they can with confidence recommend the property as being a good investment and likely to prove continuously remunerative." Provision is made for £35,000 working capital which is estimated to be sufficient to erect a 40-stamp mill and other necessary plants, and pay the mining cost until the mill begins working and leave £10,000 to provide for contingencies. The price paid for the property by the company is £65,000, of which the vendors elect to take £30,000 in fully paid-up shares of the company.

Trinity.

DEADWOOD.—*Cor. Trinity Journal*, Feb. 8: A slide occurred last Saturday at the turn in the road just above Mr. Leonard's house that moved one of the cabins from its foundation. The cabin was occupied by some of the miners as a sleeping apartment, and they were in the cabin when the slide occurred. Another slide just above the Brown Bear mill occurred the same day, covering the mouth of what is called the West tunnel, and burying five cars. The tunnel was completely dammed up, but the pressure from the water from within soon forced the mouth of the tunnel open, when the water and gravel came down in immense quantities as if a large reservoir had broken loose, running directly through the mill, and nearly covering the concentrators and depositing about two feet of mud and gravel all through the mill. The fire in the furnace was immediately extinguished to prevent damage by fire in case any more slides came down. Of course the mill had to be closed down, and it will take several days to repair the damages. This is the only mill on the Deadwood divide that has succeeded in running constantly during all the cold and stormy weather of the season, and it is really quite a misfortune to be compelled to close down at this time.

Tuolumne.

FREE GOLD.—*Union Democrat*, Feb. 8: The report from the Mary Ellen mine is very favorable. It steadily improves as the work of development goes on. The two strikes recently made of ore rich in free gold are very important, as they indicate the existence of a large pay chute of ore. It is in fact the union of two chutes constituting one large body, and also proves that the ore goes down and increases in size and depth.

BLACK OAK.—The Black Oak mine and milling property, situated near Soulsburyville, will be sold by the sheriff to-day, to satisfy a judgment obtained by W. G. Scott.

NEVADA.

Washos District.

SIERRA NEVADA.—*Virginia Chronicle*, Feb. 8: Underground operations, temporarily suspended the largest portion of the week on account of the scarcity of fuel, will be resumed with the usual force next Monday.

CON. CALIFORNIA & VIRGINIA.—The extraction of ore, suspended pending the snow blockade, is resumed and shipments have been made to the Morgan and Eureka mills during the past four days. On the 1650 level the raise above the end of the east

crosscut from the end of the north drift from the winze, sunk 60 feet below the end of the south drift, has been advanced 23 feet and the top is in quartz. The raise above the end of the north drift, from the main west drift from the C. & C. shaft, is up 8½ feet. Shipped to the Morgan mill 902 tons and 1090 pounds of ore and to the Eureka 639 tons and 1040 pounds; battery sample assays showing an average value of \$27.50 per ton. Bulion valued at \$54,675.71 shipped to San Francisco.

UNION CON.—On the 1465 level in the north lateral drift 100 feet south of west crosscut No. 3, west crosscut No. 4 is advanced 184 feet, and continues in porphyry and clay.

MEXICAN.—On the 1465 level west crosscut No. 3, 100 feet south of No. 2, from the north drift from west crosscut No. 1, from the main north lateral drift, is extended 3 feet in a porphyry formation.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station a south drift is advanced 333 feet, from the end of the east crosscut, 316 feet from the shaft station, continuing in porphyry and quartz.

GOULD & CURRY.—On the 200 level the south-west drift is extended 340 feet. Formation, quartz, showing some value. On the 400 level the south-west drift is extended 85 feet. Formation, porphyry, clay and quartz, showing some value.

BEST & BELCHER.—On the 1000 level east crosscut No. 1 extended 132 feet. Formation, hard porphyry. On the 1200 level the north drift is cleaned out and repaired 193 feet.

SAVAGE.—Daily shipments of 60 tons of ore resumed and the usual exploratory work is in progress from the 400 to the 900 level.

HALE & NORCROSS.—The usual exploratory work is in progress. Ore shipments to the Nevada mill were resumed Feb. 5, averaging 150 tons daily.

CHOLLAR.—Crushing 60 tons of ore daily, pulp assays showing an average value of \$22.50 per ton.

POTOST.—The 930 level east crosscut has entered low-grade quartz. Repairs to the timbering of the openings on the 650 level still in progress.

ANDES.—North compartment of shaft opened to the 420 level and repairs in progress to middle compartment preparatory to drifting for downward continuation of ore developed on 350 level.

IMPERIAL.—Operations were resumed February 4. The 300 level west crosscut, No. 2, is cutting occasional ore bunches. The 500 level west crosscut is in quartz. The 500 level north drift is out 1338 feet from the Yellow Jacket shaft.

ALPHA.—The 600 north drift continues in quartz showing fair assays. The 500 level west crosscut is in low-grade quartz and porphyry.

EXCHEQUER.—The 500 level east crosscut at the Alpha line continues in quartz and porphyry.

WARD COMBINATION SHAFT.—The 1800 level east drift is advanced 192 feet.

OVERMAN.—Will resume ore shipments next week.

NEW YORK CON.—Opening the 600 level to cut upward continuation of ore developed on the 800.

CALEDONIA.—West crosscut No. 3 is in low-grade quartz and porphyry.

CROWN POINT.—Ore shipments resumed and average 150 tons daily. Pulp assays show an average of above \$18 per ton.

BELCHER.—The 850 level east crosscut continues in porphyry. Explorations resumed at all points.

SEG. BELCHER.—Ore bunches still showing in the 1200 level drift from the winze. The 1000 level east crosscut continues in low-grade quartz.

SILVER HILL.—Usual progress made in 160 and 260 level explorations.

JUSTICE.—The mill is crushing the usual amount and quality of ore.

ALTA.—The mill is again in full operation crushing the usual amount of ore, pulp assays showing an average value of \$24.50 per ton. The northwest drift from the winze bottom, below the 925 level, is in low-grade quartz.

UTAH.—On the 600 level the southeast drift from the shaft station is extended 840 feet. Formation, soft porphyry, with clay, quartz and water.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the 400 and 450 levels. The 500 level west crosscut has reached the footwall. Have started a raise 100 feet south of No. 3 raise. The 550 level east crosscut is advanced nine feet in porphyry and clay and the west crosscut has reached the footwall. From the end of this crosscut have started a south drift in ore of fair quality.

NORTH OCCIDENTAL.—The 550 level joint east crosscut is extended eight feet in porphyry and clay. The joint west crosscut has reached the footwall and from the end of it a north drift is started in fair quality ore.

Cherry Creek District.

LITTLE DOING.—*White Pine News*, Feb. 1: A corporal's guard of men is employed at the Star and a couple of miners at the Exchequer. Apart from this, mining has virtually ceased for the time being. Notwithstanding this direful state of affairs there exists a well-grounded belief that there will be ere long a resuscitation of the mining industry and a total eclipse of Cherry Creek's former palmy days in the glory and magnitude of its future output of treasure. This language may seem extravagant, but such is the prevailing sentiment, and it is proclaimed by all familiar with the mineral resources of this and neighboring districts.

Eureka District.

RUBY HILL TUNNEL.—*Sentinel*, Feb. 6: The Ruby Hill tunnel is now in 1560 feet and is passing out of the hard formation it has been running in for a long time past. The air is good, being supplied from big crevices near the breast, which shows that the ground ahead is in a more broken condition and of a better nature for ore than has been encountered for some distance. A contract will be let as soon as the next 100 feet have been driven.

Hawthorne District.

CLAIMS BEING WORKED.—*Walker Lake Bulletin*, Jan. 28: The miners, manifesting their faith in the mines of Hawthorne, are working on various claims with increased vigor. The Good Hope, owned by Striker & Box, shows a strong vein of ore of fair grade. This mine is in close proximity to the Pamlico, and is claimed to be on the same belt of mineral. At present work is being done in running a tunnel to tap the ledge, which it is expected will be completed within a few days. The Consolidated shows fine ore. George Olsen is engaged in driving a tunnel on the ledge and extracting pay ore, though in small quantity. This claim is situated in Neversweat

gulch, and now shows itself as a bullion-producer. The New York is worked by lessees who have on the dump about 10 tons of good ore and are daily extracting more. The Pamlico has survived from the recent litigation decided in its favor, and is now working a force of 10 men extracting rich ore. The force will probably be increased in a short time. The Evening Star is also worked by Barlow & Longabaugh, who have a lease of the property, and are at work in the lower levels. They are reported as doing well. The Early Dawn is being worked by the owners, Kimball & Waddell, who have three men regularly employed drifting and stoping. They have been getting good ore all the time. The mine presents very flattering prospects of a big bonanza. The Gold Bir, owned by D. Tubino, has two men at work. There are rumors of a big lawsuit concerning the ownership of this claim. It must be, as it is, a valuable mine when such signs of war are afloat. The work of extending a tunnel on the vein is actively going on. The assessment work has been done on many other claims in the district. Badger Bill and Chas. Ganong have started up the Compromise mine. It is in a good locality and with work it will no doubt show up in time with other paying mines in the district. Tom Daly and John Hammond are at work on the North Star.

Jett District.

SENATOR.—Belmont *Courier*, Feb. 1: Assays of ore from the Senator mine, made by Geo. Nicholl on Wednesday last, resulted as follows: No. 1.—Silver per ton, 59½ ounces and 66 66-100 per cent lead. No. 2.—Silver per ton, 64 ounces and 69 21-100 per cent lead. No. 3.—Silver per ton, 73 ounces and 69 80-100 per cent lead. The Senator mine is situated in Nye county and is owned by Thos. Warburton of Belmont. The above assays show that Jett is one of the best silver and lead mining districts in this part of Nevada. There are large bodies of ore in the various mines of that district, and whenever a railroad is built through Smoky Valley the mines situated in the Toiyabe, Jefferson, Spanish Belt, Peavine and San Antonio mountains will come to the front as bullion-producers. Gold is also known to exist in all of the mountains above named, principally in the famous Ophir and Jefferson districts, Nye county.

Rosess River District.

THE CONTRACT LET.—Reese River *Reveille*, Feb. 7: The contract for timbering and sinking the Union shaft has been given to Tony Russell, Harry Harris, Joe Gill, John King, Ed Johnson and another party, whose name we did not learn. They are to receive \$450 for timbering the shaft and \$14 per foot for sinking the first fifty feet and \$14 for the following hundred. We were speaking with an old miner who worked in the Plymouth in 1862, who says "that he wished he had the money to purchase the mine, and run east from the bottom level, to strike the body of ore that pitched west from the North Star mine." This was M. J. Farrell's opinion also, who advised the sinking of the Plymouth. But the opinion of miners does not cut much of a figure with the present management.

Robinson District.

SINKING A SHAFT.—White Pine *News*, Feb. 1: The Robinson Canyon Consolidated Placer M. Co. have commenced sinking shaft No. 3 on the upper part of their ground. No. 2, prospected well, but they are determined to make a thorough test of all their ground before starting in to work with the view of production.

Tuscarora District.

PLACERS.—*Times-Review*, Feb. 8: There has been but little placer mining here, on account of the scarcity of water, for a number of years. Next spring, however, there will be plenty of moisture, and operations in that line will probably continue during the greater part of the summer. The placer diggings are all owned by Chinamen, and during favorable seasons they make good wages as long as the water holds out.

ARIZONA.

STRIKE.—Prescott *Miner*, Feb. 5: A strike of very rich sulphur ore is reported to have been made in the Senator recently. The Congress mill continues to run day and night, while work in the mine is being prosecuted with vigor. Owing to the recent storms and muddy roads, there are about 20 carloads of concentrates piled up in the mill, awaiting shipment. P. J. Fitzgerald made a clean-up yesterday, at the sampling works, on a lot of ore taken out of a Turkey creek mine. The result proved highly satisfactory. J. R. Liston left this morning for the Del Paso mill, in the Bradshaw mountains, which he is running successfully on ore from the Old Reliable mine. F. L. Carlisle, superintendent of the Black Horse mine, is running a double shift on the mine, and will soon have it in shape to commence sinking. The shaft in the Quartz Mountain mine is down 150 feet, and G. J. Wickler, a practical miner, recently employed there, says there is an abundance of fine milling ore in the shaft, which goes all the way from \$30 to \$150 per ton. J. C. Brown, of the company, will go out to the property to-morrow. J. D. Helm, superintendent of the Oro Bella M. Co., is in town. He has had a two months' run of the mill, which he says proved highly satisfactory. He is now engaged in building a tramway to the Grey Eagle mine, which was recently purchased by the Oro Bella Co. They intend to put in a chlorination plant at the Oro Bella mill, to work the base ore of the Grey Eagle mine, both that and the Oro Bella mines being rich in free gold also.

OLD DOMINION.—*Silver Belt*, Feb. 1: The new cages for the Old Dominion Co. arrived last week and have been put in place in the Interloper shaft. We understand that sinking is to be commenced at once. The present fine weather is very favorable to surface work, and has given the company opportunity to make several needed improvements. Coke has arrived in quantity during the past ten days, and there is not likely to be any interruption in smelting for some time to come.

GARFIELD.—Mobeave *Miner*, Feb. 8: Mr. Fisher has a lease on the Garfield and has a carload ready for shipment. A. E. Rogers and Juan Canos have commenced work on the Intic gold claim in Chloride. David Southwick is taking out good ore on the Buckeye. James Mitchell, who has had a lease on the Virginia, has a carload of good ore ready for shipment. The Rattan M. Co. have concluded not to purchase the quartz-mill of the Monarch M. Co. In the Music mountains mining affairs are at pres-

ent looking brighter than ever before, and a good deal of development is being done. E. F. Thompson is making a 50-ton shipment from his Empire No. 2, Chloride. John K. Mackenzie has struck a body of good ore in the Cincinnati mine, which he recently banded from W. H. Hardy. F. Byers and P. R. Washington have taken out 45 tons of ore from the three mines in that district. The district needs reduction works, so that the ore can be worked near the mines, and the prospects are at present favorable for them. It is authoritatively stated that active operations will be soon commenced on the Montezuma in San Francisco district. This mine is owned by New York capitalists. Supt. Bowers will commence work on the Night-hawk, Layne Springs, as soon as the necessary supplies can be got to the mine. Supt. Mackenzie has about 50 tons of ore ready for shipment from the Cupel. All the first-class accumulated since December has been worked, and gave results of from 260 to 338 ounces silver per ton, the whole averaging over 300 ounces per ton. There is a force of more than 20 men employed, and the product is about the usual quantity.

HARQUA HALLA SOLID.—The Bonanza mine is proving to be a really fine property. Its greatest depth is 140 feet, but in the absence of hoisting works drifting has only been prosecuted from the 60-foot level. Some 270 feet of stoping ground is now opened up, leaving, according to Foreman Tom Brown's estimate, 3000 tons of ore in sight. The pay streak varies from 5 to 12 feet in width, and the last millrun showed an average in the ore of \$30 per ton, free gold. Tom Cochrane is in charge of the Harrisburg mill. A cleanup from 14 days' operations yielded \$8500. Mr. Cochrane, who is in town, although a part owner, keeps his head, and will only admit, in a matter-of-fact way, that he considers the claim a "good property." It is doubtful if the Congress mine showed up better at the present development.

COLORADO.

STRIKE IN THE EXPRESS.—Aspen *Times*, Feb. 7: For several days rumors have been heard of an important strike in the Express mine at Ashcroft, which is being worked by the Express Mining Company, under the management of H. J. Russell. It has been impossible to secure accurate information regarding the developments that had given rise to these reports, but when Mr. McK. Robinson, who was formerly an owner in the property, was seen by the reporter, he stated that samples of ore had been brought down from the property within a few days which assayed ten ounces in silver and from 64 to 70 per cent in copper. The parties who brought the ore down stated that a very large body of it had been developed, and when they got the assay they declared that the discovery was nothing less than a bonanza. Ore of this character is worth in this market about \$120 per ton. Manager Murphy of the Edison reports that the property holds out fully as well as at any time since the recent discoveries were made in it. It is shipping from 25 to 30 tons of ore per day. This is not its full capacity, but the figure is one that can easily be maintained for an indefinite period. The Silver Bell has developed a new ore body at a point some distance below the workings from which the recent heavy shipments have been made. The newly-found vein is reported to be of even better grade than that which was taken out above. Some ore is being found in the Saddle Rock, which is under lease to John Scott and others, with M. Murphy as manager. The contact is just being opened, and it is showing a good streak of very good ore. The parties interested are satisfied that they will soon have a pay mine. The road on Aspen mountain is getting in such a bad condition that teams are no longer able to bring down more than three and a half tons at a load. With a good road they haul on an average from four and a half to five tons from Tourletto park.

IDAHO SPRINGS.—*News*, Feb. 7: During the month of January there were shipped from the station at this place 128 cars containing 3,665,000 pounds of ore, a decrease of only 19,000 pounds as compared with the shipments for December. An addition to be used in storing concentrates has been built to the Mixsell mill. On Monday water was turned into the flume, which was found to be in excellent shape. Mixsell hopes to be able to start the mill running the first of next week.

DAKOTA.

THE NEW HOPE LODE.—Deadwood *Pioneer*, Feb. 5: This is a promising location near the Standby—formerly known as the Little Rapid Lode—its high value consisting in the high-grade concentrates which it yields after the extraction of the free gold. It was experimented with by Prof. Carpenter during his geological survey, who informed the reporter that the concentrates would yield about \$25, and it requires about four tons of rock to make one of concentrates. It is a large, well-defined deposit of the class which he denominates "bedded." It is under bond to some of Rapid's scientific men, who hope to sell it for big money. The name of the lucky owner is Joe Walter.

CARBONATE.—Frank Bryant, superintendent of the Spanish R., is now sinking a shaft on the property. The mine looks remarkably well, and as some have said, promises a "bonanza." At the Iron Hill, Stewart Thompson is as busy, in fact more so than before the fire, getting ready for rebuilding. The debris is being removed as fast as possible, and lumber is arriving daily for the new structure. Seabury-Calkins are getting ready for extensive sinking and drifting, overhauling machinery, etc. Take it all in all, the camp has lost none of its vim on account of the fire.

IDAHO.

THE CINNABAR.—Clayton *Free Press*, Feb. 6: This mine was located by Kirk Bros., in 1881. Two shafts have been sunk on the ledge and the discovery shaft is sunk on the footwall to a depth of 330 feet, showing ore on three sides from top to bottom, and at the terminus of said shaft there is five feet of solid ore, going down, that assays \$28 in gold, 80 ounces silver and 30 per cent lead. It could not be worked farther on account of bad air. Out of this shaft over \$50,000 worth of ore has been shipped, as the receipts from the smelters show. At this point work was suspended. Going south on the surface about 600 feet, they have sunk a shaft on the footwall

of the ledge to a depth of 60 feet, which is designated as shaft No. 2. In this shaft a fine body of first-class ore is exposed all the way down. On the footwall the ore, which is first-class, is 2½ feet in width, and assays \$110 in gold, 90 ounces in silver, and 30 per cent lead. The receipts from the Clayton smelter corroborate the above statement in every particular. From the footwall to the hanging-wall, a distance of 60 feet, a crosscut is driven. On the hanging-wall a body of ore is exposed which is 4½ feet in width and assays \$70 in gold, 125 ounces in silver and 30 per cent lead. Between these bodies of high-grade ore, in the intervening space of 53 feet, is a solid body of concentrating ores; which, by reducing five tons to one, as near as can be ascertained, returns \$180 in gold, 225 ounces in silver, and 70 per cent lead. From this shaft first-class ore has been shipped to the amount of \$15,000. The developments produced by shafts Nos. 1 and 2, proving conclusively the immensity of the ore deposits, induced the operators to drive a tunnel 500 feet to tap shaft No. 1. All the ores exposed to view in this mine are free from base; the gangue being carbonate of iron, makes it a valuable smelting proposition. On the dumps are from 7000 to 10,000 tons of concentrating ores, and about 150 tons of first-class ore. On this location there is abundance of fine timber, and the water in the creek is sufficient for milling and smelting purposes; thus making it an easy task to treat the concentrating ores at comparatively little cost, say from \$1.50 to \$2 per ton. This valuable property is destined for a bright future, and will rank with the Granite and Comstock. It is owned by a Highland, Ill., and a St. Louis, Mo., company.

CRESUS.—Ketchum *Keystone*, Feb. 8: The fine development made in the Cresus mine near Hailey, some three weeks ago, is proving very satisfactory, and the ore taken from the new find is improving in quality.

PELICAN.—We have it from good authority that Messrs. Lord & Gard have made a good development in the Pelican mine, located about a mile north of the noted North Star mine on East Fork. These miners have been working their claims a long time, and deserve to be rewarded for their untiring perseverance.

STAR OF HOPE.—Hugh Fraser came in from the Star of Hope mine on the Lost river divide on Thursday. He and the Ross brothers have been working that mine during the winter. He reports the mine looking well and producing good ore. The snow is from ten to twelve feet deep on the level at their place.

LOWER CALIFORNIA.

PLACERS AND QUARTZ.—*Lower Californian*, Feb. 6: It is the intention of the Lower California Mining Co. at the Real del Castillo to employ 100 men constantly at their mines, and to operate 15 quartz ledges besides the placers.

HYDRAULIC MINING.—"It will be Mexico's first attempt at hydraulic mining on a large scale," remarked Col. T. Masac, President of the Lower California Mining Co. "Our sluice-boxes are now being rapidly put in place at Rich Gulch. This \$40,000 flume we have been some months building is a combined aqueduct and ditch four and one-half miles in length. The grade is seven and three-quarters feet to every hundred feet, making a uniform pressure. The capacity of the flume is 600 miners' inches. Our longest trestle is 1700 feet, with a depth of 35 feet. There are five in all and they have consumed over 100,000 feet of Oregon pine and redwood. The sluice-boxes will be secured with Yale locks, and three different people will have keys, which, used together, will alone open the combination. As soon as the placer work is well under way, I shall put a large force of men on the quartz ledges, where we have 15 veins to develop. There are some excellent prospects waiting."

MONTANA.

THE SILVER CROWN.—*New Northwest*, Feb. 7: Certainly the best showing of any prospect in Oro Fino, the amount of development considered, is that made by the Silver Crown. The shaft has reached a depth of nearly 70 feet, having followed the vein on an incline. At the start but four inches of ore showed up in the vein. This has now widened to 18 inches of solid, high-grade ore. Thomas Strang made a number of assays this week of samples taken from across the lead, which gave the following returns: No. 1, \$686.71; No. 2, \$661.86; No. 3, \$233.30; No. 4, \$186.66; No. 5, \$131.90. As the ore has steadily increased in quality as well as in quantity, with depth, and as the formation is solid and unbroken, the Silver Crown can conservatively be numbered among the best prospects in the district. So far as we are advised, no such showing of high-grade ore at equal depth has ever been made in the camp.

THE OHIO.—The most important mining event of the week is the strike in the Ohio. At a depth of 150 feet a crosscut to the south was started. This had been run a distance of 47 feet last Monday when the vein was encountered and cut six feet to the wall. Of the six feet of vein matter, nearly four feet is solid ore ranging in value from 70 to 80 ounces to the ton, according to numerous and careful assays. The strike occasioned considerable stir among mining men.

GRANITE MOUNTAIN.—Phillipsburg *Mail*, Feb. 6: The output for the week ending Feb. 6th was 48 bars of bullion containing 72,455 ounces fine silver and 158 ounces fine gold.

THE SIMPSON.—The Simpson lode, about two miles south of Rumsey, is likely to prove to be a bonanza. The vein is about four feet wide and lays in the granite and porphyry, and runs high in silver and carries some gold. This new find is owned by John Berry and M. Gerberg.

THE SOUTHERN CROSS.—Salton Cameron of the Southern Cross reports his mill as running in excellent shape and the ore from the Southern Cross as being richer than ever.

EMIGRANT GULCH.—Emigrant gulch, Park county, is rather quieter this winter than usual, and most of the miners who for a number of years past have resided here are enjoying winter quarters in Chico, while the more transient of the population have gone to winter elsewhere. But little work is being done in the gulch, but the miners still hold the claims to which they have pinned their faith so long, and have an abiding confidence in the ultimate prosperity of the camp. Their hopes are well founded and the coming season promises to witness a veritable

boom for this camp, as the rich character of her ores are becoming known abroad and capital is beginning to be placed in the more prominent claims here by outsiders. It is confidently expected that a plant for reduction of ore will be built at the opening of the coming season, and Emigrant promises before long to rank equal with the richest of Montana's mining camps.

NEW MEXICO.

SIERRA CO.—Kingston *Shaft*, Feb. 8: The mining outlook for Sierra county never was better than at present. Every district in the county shows renewed activity. Hillsboro, Chloride, Lake Valley, Hermosa, and Kingston are all producing steadily. Hillsboro is probably working a larger force of men than at any time since the district was discovered. The Silver M. Co. of Lake Valley are working 115 men, which, considering the vast amount of machinery, does the work of 400 men. At Hillsboro and Chloride the number of hands employed in the mines is steadily being increased. During the past week the mines at Hillsboro have experienced considerable difficulty in securing miners to do the work. It is patent to the observer that the mines of the Kingston district will, within a short time, largely increase their working force.

THE ECLIPSE.—This mine is looking more than sanguine, and Mr. Renchler, the superintendent, is well pleased with the present outlook. Yesterday he unexpectedly struck a 2-foot vein of ore lying horizontally. Upon assay he discovered that six inches lying between the lime and shale returned a value of 300 ounces silver.

THE BONANZA-GOOD HOPE.—This mine, which has made a good record as a producer during the past year, and owned by the Animas Peak Mining Co., has been transferred to the Bonanza-Good Hope M. Co., lately incorporated under the laws of New Mexico.

TO BEDROCK.—John Belcher and Mike Falvey are sinking a shaft on Flapjack Hill, that famous producer of nuggets and shot gold. They are sinking this shaft through the contact with the purpose of striking the original bedrock, which has never been tested.

EL ORO.—This mine is in Dutch Gulch, six miles north of Hillsboro; and development is being pushed upon it with vigor. The new forty-horse power hoister is now in position, and the main working shaft has reached a depth of 110 feet. It is expected that this shaft will cut the vein any day.

OREGON.

SPARTA.—Cor. Bedrock *Democrat*, Feb. 6: The little Pittsburg mill will fire up soon. The extension mine of the Old Gem, owned by Jack Davis, is now down 70 feet, showing a well defined 20-inch pay streak the entire distance. The Union tunnel, being run to develop the Gray Eagle and Union mines, owned by Clough and Reed, is being pushed rapidly by Al. Waldron, contractor. Dr. Marotte and brother undoubtedly have the bonanza mine of Eastern Oregon. In the face of their 300-foot tunnel they have three feet of \$25 free gold ore, and in the winze at the 260-foot station, they have four feet of \$40 free gold ore, and over 100 feet of ore in their stopes.

CORNUCOPIA.—In regard to the outlook of the mines of Cornucopia district, Mr. Robert Kelly says: "The people of the Pine Creek mines are more hopeful that a number of mining sales will be made this summer than they have ever before been. From a careful noting of the camp I find 26 mines that, as far as work has been done on them, give almost positive evidence of becoming dividend-paying properties. And there are a legion of other mines that are in that indefinite condition that it would be too risky to predict their future, but doubtless a reasonable per cent of them will also prove to be paying mines. This number of mines that have every prospect of becoming dividend-paying properties will be considered as an over-estimate by the majority of mining men, but the failing has been that experts in coming to examine the mines have remained but a few days, while it would take with laborious exertion at least two weeks to examine the district."

EAST EAGLE CREEK MINES.—That your readers may form some idea of the extent and richness of this camp, I will say that the Sheep Rock, Bradley, Faithful Boy, Mint and several other properties are sufficiently developed to show well defined true fissures of sufficient value to warrant the early construction of a plant with double the capacity of the Sanger mill, and ore enough above the water level to run her day and night for years.

UTAH.

PARK NOTES.—*Record*, Feb. 8: Last Monday the Nevada-Northland leasers caused an injunction to be served on the May Flower No. 7 leasers to restrain them from taking ore out of the Northland ground pending an adjustment of the difficulties existing between them. The owners of the Gopher claim, located just below the Woodside, are about completing a sale of a portion of their property to Colorado capitalists, who will provide the wherewith to fully develop their promising ground. Sinking the incline shaft on the Creole No. 2 still continues. The shaft is now down over 100 feet. The vein has, within the past week, changed its dip, and is now going into the hill almost perpendicularly. The indications are looking much better as depth is attained, and the leasers look for the pay streak to open out in good proportions at any time. D. F. Condon has given a year's lease on the east half of the Creole mining claim at a royalty of 30 per cent. This lease puts the Creole on top as regards the amount of royalty being received by any claim-owner in the camp, as there are two sets of leasers now operating on this single claim—one on the west and one on the east half—each paying a 30 per cent royalty, which gives the owner the unprecedented amount of 60 per cent of the claim's net output.

ORE AND BULLION SHIPMENTS.—The Ontario bullion shipment for the week was 30 bars, containing 18,026.68 fine ounces of silver. Gitsch and Campbell, leasers of the upper workings of the Crescent mine, shipped 48,375 pounds first-class ore this week. During the week the Mackintosh sampler received and forwarded 261,730 pounds of Mayflower, 27,690 pounds of Woodside, 300,770 pounds of Ontario, and 89,250 pounds of Daly.

MECHANICAL PROGRESS.

The Progress of Invention.

The earliest and simplest forms of bronzes ax with which we are acquainted are profoundly interesting, as casting a flood of light upon the general process of human evolution all the world over. Every new human invention is always at first directly modeled upon the other similar products which have preceded it. There is no really new thing under the sun. For example, the earliest English railway carriages were built on the model of the old stage-coach, only that three stage-coaches, as it were, were telescoped together, side by side—the very first here the significant motto, *Trium juncti in uno*—and it was this preconception of the English coach-builder that has hampered us ever since with our hateful "compartments," instead of the commodious and comfortable open American saloon carriages.

So, too, the earliest firearms were modeled on the atack of the old cross-bow, and the earliest earthenware pots and pans were shaped like the still more primitive gourds and calabashes. It need not surprise us, therefore, to find that the earliest metal axes of which we have any knowledge were directly modeled on the original shape of the stone tomahawk. Such a copper hatchet, cast in a mold, formed by a polished neolithic stone celt, was found in the early Etruscan tombs, and is still preserved in the museum at Berlin. See how natural this process would be. For, in the first place, the primitive workman, knowing already only one form of ax, the stone tomahawk, would naturally reproduce it in the new material, without thinking what improvement in shape and design this malleability and fusibility of the metal would render possible or easy. But more than that, the idea of coating the polished stone ax with plastic clay, and thereby making a mold for the molten metal, would be so very simple that even the neolithic savage, already accustomed to the manufacture of coarse pottery upon natural shapes, could hardly fail to think of it. As a matter of fact, he did not think of it; for celts of bronze or copper, cast in molds made from stone hatchets, have been found in Cyprus by General di Cesnola, on the site of Troy by Dr. Schliemann, and in many other assorted localities by less distinguished but equally trustworthy archaeologists.

To the neolithic hunter, herdsman, and villager, this progress from the stone to the metal ax probably seemed at first a mere substitution of an easier for a more difficult material. He little knew whither his discovery tended. It was pure human laziness that urged the change. How nice to save yourself all that long trouble of chipping and polishing, with ceaseless toil, in favor of a stone which you could melt at one go and pour while hot into a ready-made mold! It must have looked, by comparison, like weapon-making by magic; for properly to out and polish a stone ax is the work of weeks and weeks of elbow grease. Yet here, in a moment, a better hatchet could be turned out all finished.

But the implied effects lay deeper far than the neolithic hunter could ever have imagined. The bronze ax was the beginning of civilization; it brought the steam engine, the telephone, woman's rights and the county councillor directly in its train. With the eye of faith, had he only possessed that useful optical organ, the stone-age artisan might doubtless have beheld soap and the deceased wife's sister looming dimly in the remote future. Till that moment human life had been almost stationary; thenceforth it proceeded by leaps and bounds, like a kangaroo society, on its upward path toward triumphant democracy and the penny post. The nineteenth century and all its wiles hung by a thread upon the success of his melting-pot. —*Cornhill Magazine*.

The Plate-Glass Industry.

The development of the American plate-glass industry within a very few years has been very rapid and successful, so much so in fact that the home product has driven the foreign out of the market. The demand for this class of goods has also increased of late, stimulated no doubt by the low price at which it has been offered, and which is still sufficiently high to make its manufacture profitable, and all the factories in this country turning out plate-glass are now driven to their uttermost capacity. Noting the growing prosperity of this industry, and influenced by its future prospects, there seems to be a plan developing by capitalists to go into its manufacture more extensively. It is also reported that one at least of the English companies, which are no longer able to do a paying business in exporting their product, has decided to come to America and put in a plant to compete with those already established here.

The employment of foreign capital in this country, not only in establishing new, but in the purchase of plants already established, has been a subject which has been pretty freely discussed through the press, and in many cases has been carried to an extent that has caused those not thoroughly acquainted with the facts and conditions thus brought about to have some apprehensions of evil results, and to form exaggerated ideas of the extent and capacity of these foreign investors.

As a matter of fact, however, there is not

the slightest ground for any uneasiness, and not only this, but we are inclined to think that it may be a possible benefit to the country in certain ways not yet fully appreciated by those who are so bitterly opposed to foreign capital investments. There is only one thing to be feared, and that seems hardly probable at the present time, and that is the possibility that this country may declare for free trade.

In connection with the manufacture of plate glass, the establishment here of an English concern would only tend to reduce the price to the consumer and consequently decrease the profit to the manufacturers, but this would come as heavily on the foreigners as upon us. We have all the advantages that they have. If they come here they are obliged to use the materials at hand, which are as readily obtained by their competitors, so that it is merely a matter of competition between producers, with decided advantages in favor of local plants.

MOVEMENT OF THE IRON CENTER.—There appears to be every indication that Pittsburgh will soon cease to be the great center of iron production in this country. Alabama seems to be rapidly coming to the front. The following statistics are quite noticeable in this connection. Alabama now has 44 blast furnaces and eight buildings, against 24 completed and 19 building in November, 1887. In Pennsylvania there are now but 230 active furnaces, against 242 in condition to make pig iron two years ago. The capacity of Alabama furnaces in November, 1887, was 423,000 net tons, against 1,277,000 net tons November last year. In Pennsylvania, November, 1887, capacity was 5,073,988 tons, against 5,733,588 November, 1889.

THE BRIQUETTE MAKING INDUSTRY is rapidly gaining ground in Europe. In and about Halle, in 1875, there were only 25 presses in operation turning out the produce of 250 tons of small coal. Now, in 1890, there are 65 works, with 186 presses, which will use up some 2,500,000 tons. Twenty-two additional presses have just been put in operation, making a total of 208. A large quantity of lignite briquettes are now being imported from Austria-Hungary. This industry is not making as rapid progress in this country as its merits and profits would seem to require.

ELECTRIC DOORS.—The Tremont theater, Boston, is now fitted with electric doors, which can be opened by simply touching one of eight push-buttons situated in convenient places in the theater. On the slightest alarm 17 eels of folding doors are immediately and simultaneously thrown open by the electric circuit, doing away, in a large measure, with the danger of being trampled to death in cases of panic.

THE LONGEST LIGHT CIRCUIT.—An incandescent light company at Ottawa is now working a circuit 45 miles in length. This is believed to be the longest incandescent circuit in the world, and it is questionable whether it is approached by an arc circuit. It is certainly a remarkable instance of flexibility of system and of the delivery of the electrical current at an extremely remote point.

TWO USES OF COMMON SALT.—Among the many uses of common salt may be mentioned two which admit of frequent application. Salt put in water which surrounds the ordinary glue-pot causes a hotter glue to be obtained than where simple water is used. Salt in the water where mason-work is being done in cold weather prevents disintegration by frost.

ELECTRICITY FROM THE WIND.—The storage battery harnessed to the windmill is sure to become of great service in driving the machinery of future generations. Before very long more attention will have to be given to the yoking of the winds, waves and tides to the driving-shafts of our industrial works to supplement the storage reservoirs of the coal mines.

MACHINES FOR PACKING MATCHES have recently been tried with encouraging results. One machine, the invention of two young Norwegian engineers, has a packing capacity of 1000 boxes per minute. Ingenious machines for the various operations in the match manufacture have been in use in Scandinavia for some time, and more are expected.

RIGIDITY IN BRIDGE WORK.—The gradual failure of a cast-iron bridge erected about 45 years ago at Potsdam, Pa., has been the cause of considerable scientific inquiry. The conclusion arrived at is that the bridge members were too rigidly connected, no adequate allowance being made for effects of varying temperature.

A DURABLE JOINT, and one that will be permanent, can, it is said, be made between rough cast-iron surfaces by the use of mineral ashes mixed with sufficient white lead to make a very stiff putty. This will resist any amount of heat, and is unaffected by steam or water.

COMPARATIVE COST.—The hydrocarbon process of treating iron so that it will not corrode is said to cost less than one-half of that of galvanizing, while the durability, under similar conditions, is considerably extended.

SCIENTIFIC PROGRESS.

Air in Water.

The *Locomotive* says that the purest water often is the most active in corroding and pitting plates, and this makes it probable that the active substance, in some cases at least, is air. It is well known that water is capable of dissolving a considerable amount of air; in fact, it is this dissolved air that enables fish to breathe. It is not so widely known, however, that the oxygen of the air is more soluble than the nitrogen. If a small quantity of water be shaken up in a bottle, it dissolves some of the enclosed air, and when this is afterward driven off by boiling and analyzed, it is found to consist of oxygen and nitrogen in the proportion of 1 to 1.87, instead of 1 to 4, as in the natural air. Thus the dissolved air, being more than twice as rich in oxygen as common air is, and being brought into more intimate contact with the metal by means of the water that holds it in solution, exerts a correspondingly more noticeable effect.

It is probable, too, that water plays some other important action in connection with the oxidation of metals, for it has been found by recent experiments that pure oxygen will not combine with things that it has the greatest affinity for, provided it is perfectly dry. Even the metal sodium, which has an intense affinity for oxygen, may be heated in it to a very high temperature without combination, provided sufficient precautions are taken to exclude the slightest trace of moisture. It appears, therefore, that water plays a most important part in the oxidation of metals by air—a part, indeed, that we cannot explain, and that we really know but little about.

In this connection we would recall a fact which seems of late to have been largely lost sight of, but which was fully proven to be a fact some 25 years ago—to the effect that a person may descend in a diving-bell without any air-tube and remain thus submerged for hours, without receiving any air from the surface—the needed air being supplied by repeated jets of water distributed through the chamber of the bell by means of a very fine sprinkler connected by a pipe and cut-off cock with the outside sea-water. The water thus introduced in a fine spray, parted with the air which it always holds in solution, in quantities sufficient to meet all the wants of the occupants of the bell. It also absorbed or washed away the carbonic acid gas generated by the breaths of the occupants. The water was introduced at intervals of 10 or 12 minutes, and was allowed to spray for some two minutes at each interval. The query was that so small a quantity of water was required. It was then supposed that the air thus enclosed contained only the same proportion of oxygen as was found in the ordinary atmosphere. The experiments above recorded furnish a solution of the query. About that time a submarine boat was also constructed and navigated under water, as an experiment, the occupants supplying themselves with air in the same way as did the occupants of the diving-bell. All later submarine boats have been supplied with condensed air. We have seen no reference to any further experiments of such a nature for the last 20 years or more. Has their knowledge been forgotten or overlooked by engineers, or are they considered unsuited for practical application?

The Bee's Sting a Useful Tool.

A new champion has arisen to defend the honey bee from the obloquy under which it has always rested. Mr. William F. Clarke of Canada claims to have discovered from repeated observations that the most important function of the bee's sting is not stinging. In a recent article he says: "My observations and reflections have convinced me that the most important office of the bee sting is that which is performed in doing the artistic cell work, capping the comb, and infusing the formic acid, by means of which honey receives its keeping qualities. As I said at Detroit, the sting is really a skillfully-contrived little trowel, with which the bee finishes off and caps the cells when they are filled brimful of honey. This explains why honey extracted before it is capped over does not keep well. The formic acid has not been injected into it. This is done in the very act of putting the last touches on the cell work. As the little plant trowel is worked to and fro with such dexterity, the darts, of which there are two, pierce the plastic cell surface and leave the neoteric beneath its tiny drops of the fluid which makes it keep well. This is the 'art preservative' of honey. A most wonderful provision of nature, truly! Herein we see that the sting and the poison bag, with which so many of us would like to dispense, are essential to the storage of our coveted product, and that without them the beautiful comb honey of commerce would be a thing unknown."

If these things are so, how mistaken those people are who suppose the bee is, like the prince of evil, always going about prowling in search of a victim. The fact is that the bee attends to its own business very diligently, and has no time to waste in unnecessary quarrels. A bee is like a farmer working with a fork in his hay-field. He is fully occupied and very busy. If molested or meddled with, he will be very apt to defend himself with the instrument he is working with. This is what the bee does; and man, by means of his knowledge of the nature and habits of this wonderful little insect, is enabled, in most cases, to ward off or evade attack. —*Scientific American*.

The Latest from Edison.

A recent telegraphic dispatch to the *Chronicle* describes a new device just announced by Mr. Edison, which consists of a combination of the phonograph and camera by which a speaker, in full action and gesticulation before the combined instrument, may have his speech conveyed by the phonograph, while the camera conveys his bodily presence, action and gesticulation to a distant quarter, where it is reproduced and shown upon a screen. The idea was suggested to Mr. Edison that if a rifle-bullet could be so photographed as to show the bullet as it at rest in its swift passage, with the condensation of air in its front, a vacuum behind and air eddies in its course, it would be possible to photograph a speaker as many times in a second as would be required to keep him in all his motions directly before the eyes of an audience, the successive photographs being conveyed, as rapidly as produced, upon a distant screen. The close of the dispatch reads as follows:

He thought that if a speaker's personality could be brought before the eye by means of photography and a stereopticon while the phonograph was bringing the subject-matter before the ear, an important end would be gained, and to accomplish this, experiments were planned and carried out.

The result has been a marvelous success. Imagine a popular lecturer, preacher or orator delivering an address. In front of him, at a so-called reporter's table, are two small machines, one the well-known phonograph and the other an ingenious piece of mechanism by which photographs of the speaker are taken in succession with enormous rapidity at intervals of from one-eighth to one-twentieth of a second.

And suppose both of these machines are at work silently recording both the uttered speech and the personal appearance of the speaker. The results thus obtained may be sent to any desired point and thrown on a screen by an ingeniously contrived piece of mechanism. Thus the exact appearance of a speaker, with all his gestures and plays of features, are exactly reproduced, while the phonograph simultaneously delivers his speech.

The interval between successive photographs is so infinitesimal that even the picture is an apparently living one, moving, gesticulating and uttering words in fact spoken by the phonograph. The greatest difficulty experienced by Edison in his experiments was the synchronization of the two instruments so that the utterance of the phonograph should exactly coincide with the gesticulation, but this was finally overcome and the experiments were crowned with the most perfect success.

Edison is not pushing the matter at present, being absorbed in his experiments on electrical traction for street cars. When that problem is decided he may bring this new invention prominently before the public.

SULPHATE OF COPPER.—Dr. Farnies of Paris has recently been making some curious experiments with sulphate of copper, which he has announced to his colleagues of the Academy of Medicine. The hands of a young woman, on whom the experiments have been made, became not merely wrinkled and cracked after being immersed in a solution of sulphate of copper, but swelled out in a peculiar fashion. Though her sense of touch remained unimpaired, the flesh became insensible to the pricks of a needle or the cuts of any sharp instrument. Dr. Farnies' experiments also proved once again that salts of copper do not possess the poisonous properties formerly attributed to them. This advance of science can scarcely benefit the herborist Moreaux, who was guillotined for having poisoned his wife with the salts in question.

THE TELEPHONE.—We have cited several instances in these columns where the telephone and telegraph have been quite fully foreshadowed many years ago. Perhaps there is no more remarkable case than the following: In 1667 Robert Hooke of London described how he transmitted sound by means of a wire to considerable distances. Wheatstone described his "telephone" as early as 1821, and in 1854 Ch. Boreson said: "Suppose a man speaks near a movable disk, sufficiently pliable to lose none of the vibrations of the voice, that this disk alternately makes and breaks the currents from an electric battery, you may have at any distance another disk which will simultaneously execute the same vibrations. It is certain that in a more or less distant future, speech will be transmitted by electricity."

THE MODERN IDEA OF A DRAGON quite closely agrees with a prehistoric animal which has recently been found by Professor Marsh in a fossil condition in the upper cretaceous deposits, along the eastern slope of the Rocky mountains. The larger skeletons, as found in parts, indicate the former existence of an animal larger than any now found living—the skull being over eight feet in length. A striking feature of the skull is its armature, which consisted of a sharp beak in front, a strong horn on the nose, a pair of very long pointed horns on top of the head, and a row of sharp projections around the margin of the posterior orbit. The animal must have been not only a horrible-looking but a most powerful creature.

A VEGETABLE FLANNEL is made in Germany of fine leaves, which are spun, knitted and woven into undergarments, etc.

GOOD HEALTH.

A Labor Fallacy.

Notwithstanding frequent assertions to the contrary, physical toil is far more wearing and wasting to the human system than the same amount of mental exertion.

In the discussion of the eight-hour system of labor, it is an argument of the capitalists that mental labor is much more exhaustive than physical labor. The responsibilities that attach to positions of trust, the stress of the mental strain, the care and anxieties and vexation involved, are all magnified by the opponents of the eight-hour system. Their aim is to prove that mental laborers have a much harder time of it now than the manual workers, and hence that their demand for the reduction of the hours of labor is an unjust one.

But it is indubitably proven by experience that there is nothing so onerous and, in fact, unendurable to men as hard, physical labor. It is the one unmixed evil which all men try to escape. Pure physical exertion, without any mixture of mental effort, is painful and distasteful to everybody. No man will dig a hole in the ground for the fun of the thing. There is no sport in picking rocks or digging sewers. Work is pleasant when it is mixed with brains, and all other kinds of work are a burden.

Congenial mental labor, on the other hand, is delightful. A man who has found such congenial work is assured of a lifetime of pleasant and absorbing occupation. If such a man works too hard, it is simply because he is so infatuated with his work that his enthusiasm gets the better of his judgment.

Responsibilities which attach to positions of trust are much exaggerated. Responsibilities never much worry a man who is competent to fill the position he occupies. They add a zest and spice, and give inspiration to his work. For such a man there are no crushingly heavy responsibilities.

This statement that mental labor is as hard or harder than physical labor is a fallacy that is disproved by the universal experience of mankind.—*Boston Globe*.

OUR HOUSES AND FATAL "COLDS."—An Englishman's house is his castle, and when we approach it in a spirit of criticism, we enter upon dangerous ground, says the *Decorator's Gazette*. We do not doubt, nevertheless, that many of the "colds" which have been fatal have been caught at home, and have been due to a style of domestic architecture, ventilation and warming, which are adapted neither to heat nor cold, and are equally incapable of resisting either. A well-lighted staircase, with gas-burners on the different landings, with a wide chimney under the front door, and surrounded by rooms with good fire and badly fitted doors and windows, is as ingenious an apparatus as could be contrived for subjecting the inhabitants to all the evils which vicissitudes of climate can produce. A person who goes out of doors feels that he is about to encounter something, and braces himself in a manner which renders the assault comparatively harmless. A person who comes from a drawing-room to a staircase has not this feeling, and steps into a cold bath without warning or forethought. The difference is one of high importance, because a chill for which the system is unprepared drives back the blood from the surface upon the internal organs, and may inflict upon them sudden and serious injury; whereas, when the chill is expected, the heart is ready to assist it, and to maintain the circulation with corresponding increase of force. The path of safety lies in the avoidance of great contrasts, in such arrangement of stoves and fireplaces as may produce an approach to equality of temperature in the house, in the substitution of intended and properly placed inlets for the present system of crevice ventilation, and in the management of these inlets so that the entering air may be warmed when warming is expedient. The truth of these matters, simple though they are, and almost as easy as it may seem to insist upon them, involves the issues of life and death to many of the most useful and most valued members of the community.

FAINTING.—If it were not a serious matter, nothing could be more amusing to the experienced physician than the conduct of the average layman when a person may have fainted. Nine times out of ten the anxious spectator will seize the head of the unfortunate, elevate it, and rush for water with which to sprinkle the prostrate patient. What should one do? Why, remain perfectly cool, and instead of raising the head of the patient, do just the opposite—lower it and elevate the rest of the body. Fainting, or syncope, as it is called in medical works, is a temporary failure of the heart by which the brain is deprived of its arterial blood. So by lowering the head and elevating the rest of the body, the arterial blood, by the force of gravity, is sent to the brain, and recovery is almost instantaneous.

REMEDY FOR PERSPIRING FEET.—For feet that perspire and with a disagreeable odor, the following is said to be an excellent remedy: To a pail of cold water add about a teaspoonful of permanganate of potassium, bathe the feet in this two or three times a day, changing the socks each time, and put some boracic acid (powdered) into the socks and hoots before putting them on.

USEFUL INFORMATION.

MANUFACTURE OF JAPANESE LACQUER.—The manufacture of Japanese lacquer has until lately been quite an enigma. But Mr. Romyne Hitchcock described recently to the Washington Chemical Society the manner in which this lacquer and the beautiful Wakasa ware are prepared. Lacquer is obtained from a tree, *Rhus Vernicifera*, which grows throughout the main island of Japan, but is best around Kioto. The juices from which lacquer is obtained exude from horizontal cuts in the bark, and is collected from May to October. It exudes slowly, and is collected with a pointed instrument like a spoon, and transferred to a wooden receptacle. A dozen trees are cut in several places in rapid succession, and the juice collected from time to time. During the season each tree is visited about 20 times. As the sap first exudes it is a grayish-white thick or viscous fluid, which quickly turns to yellow, and afterward to black, when it is in contact with the air. It is strained through a cotton cloth to free it from wood and dirt, being first thoroughly stirred to make it of uniform consistency. A portion of the raw lacquer, usually about 16 pounds, is then poured into a large circular vessel and vigorously stirred with a long-handled implement for five or six hours, while the heat of a small charcoal furnace is ingeniously thrown on the surface to evaporate the water. During the stirring, certain ingredients may be added. Thus, iron is added to produce the fine black lacquer. In Tokio, a soluble salt of iron is used for this purpose; in Osaka, a fine iron dust. The lacquer is then poured into a vessel to settle, and is afterward drawn off from the sediment.

COCONUT BUTTER.—In the last Consular report published by the State Department there is an interesting account by Charles Monaghan, of Mannheim, of coconut butter, a fatty substitute for butter which is now displacing oleomargarine and genuine butter in Germany. The practicability of making a substitute for butter from the meat of the coconut was discovered by Dr. Schlunk, chemist of Ludwigshafen. It has been manufactured for a year at Mannheim. The daily production is 3000 kilograms of butter, which sells at from 13 cents to 15½ cents per pound. With real butter at from 25 cents to 35 cents a pound, the coconut imitation grows rapidly in the public estimation. It is of a clear color and agreeable to the taste. The poor use it on their tables in place of the genuine article, but those able to be fastidious use it chiefly for cooking purposes. It is free from the acids so often found in real butter, and is more wholesome. As it is free from the suspicion that attends butter made from the milk of cows affected with tuberculosis, it is much to be preferred to some kinds of butter in the market.—*Baltimore Sun*.

WHY THEY DO IT.—Every one has noticed that builders as soon as they put in the glass, especially in the lower story of structures, dash a large quantity of whitening upon the inner side of the glass. To most observers the act is no doubt regarded as a very silly thing to do, but such is not the case. There is a good reason for the act. A Chicago reporter recently interviewed a contractor on this point and received the following explanation: "We have to mark them that way or they'd be smashed in no time. You see, the workmen around a new building get in the custom of shoving lumber, etc., through the open sash before the glass is put in. They would continue to do it even after the glass is in if we didn't do something to attract their attention. That's the reason you always see new windows daubed with glaring white marks. Even if a careless workman does start to shove a stick of timber through a costly plate of glass, he will stop short when his eye catches the danger sign. That white mark is just a signal which says, 'Look out; you'll break me if you are not careful.'"

THE MILK PIPE COMPANY, which has recently been formed in New York with a capital of \$600,000, will most likely be soon put under way. The milk is not piped as a fluid in the pipe, as was first supposed, but inclosed in large cylindrical cans, surrounded by water, which propels them. The system is ingeniously worked out, and seems to have elements of promise in it. It is claimed by the company that it will be able to deliver milk in New York from a distance of 100 miles for one cent per gallon freight.

ABSENCE OF FISH IN THE YELLOWSTONE PARK.—Although the Yellowstone Park is full of springs and streams, they contain no fish. This is explained by the abundance of lava, which obliterated life when it was forced out, and has since kept the fishes out by the fact that the lava has produced a waterfall in every stream.

TEAKWOOD A PRESERVATIVE OF IRON.—It is said that there is a great increase in the consumption of African teakwood, on account of its property of preserving from rust iron or steel that is in contact with it.

GERMANY'S floating exhibition will visit 80 ports on its world's trip. It is a much grander affair than our "California on Wheels."

In Sweden a new elevator loads a 2500-ton vessel with iron ore in a day.

ELECTRICITY.

What is Electricity?

No one ever saw a current of electricity, and to the ignorant it is an intangible something which we know exists all around us, and which, if we don't take care, will shock or even kill us. What do we know about it? Next to nothing! How, then, asks the *American Machinist*, can we deal with a force we know nothing about? Science is systematized knowledge; the science of electricity is systematized facts regarding its manifestations under different conditions. From these facts certain laws have been deduced, and by properly comprehending and applying them, we are enabled to bring, in a measure, electric force under the control of man. For all practical purposes, a current of electricity (we have to deal almost exclusively with electricity as a current) may be considered as a mode of motion, a force which, when transmitted through appropriate apparatus, will do work, mechanical and chemical—evidenced as heat, light and power.

It is somewhat difficult to comprehend an intangible force; the power to do work by the aid of steam from a boiler or by a suspended weight, or coiled spring can readily be understood. We see, so to speak, the power, and we know we can supply it, but with electricity it is different. A dynamo-electric machine at rest is simply a mass of iron and wire. Where does the power come from to produce such marvellous results? A steam boiler consumes coal in its furnace, heats the water and makes steam. The spring and weight must be wound up and energy expended. Here we have the analogy. To generate currents we must expend energy; we must use steam through a steam engine to obtain the power to operate the dynamo. But why should the rotation of the armature of the dynamo generate electricity? No one knows! All we know is that such is the fact, and that for a given expenditure of energy—coal, steam engine, energy—we get back a certain percentage of electric energy in the form of a current. The proportion of conversion of dynamic into electric energy depends upon the construction of the transmitting machine—just as some steam engines will give a higher efficiency for a given expenditure of steam than others.

Electricity is merely a mode of motion; but there can be no motion without a previous expenditure of energy of some sort. The energy expended is the power of the steam engine. It rotates the dynamo and sets the electric current in motion. The current can never have the same power to do work as the steam engine, as a certain amount of energy is wasted in transmission, making itself evident as heat. To make this plain—suppose a 10-horse power engine is used to drive a dynamo, and the electrical efficiency of the dynamo is 85 per cent—that is, for an expenditure of 10-horse power of dynamic energy, we have a return of 8.5-horse power of electrical energy, 1.5-horse power being lost in transmission through the apparatus.

Electrical Tanning.

Since the days when Adam made his first leather sandals, the process of tanning appears to have been carried on as if no art was required. The truth is that the work is so comparatively simple that a man from the plow with a few days' instruction would pass muster as a tanner. And so the trade has been content to jog along, being fortified by the practical truth of the fact that "There's nothing like leather." Not but what there have been attempts to improve the process of tanning, notably by the aid of chemistry, but the results appear to have come out the wrong way for both the inventor and the trade. The exclusiveness of the tanner has, however, been successfully intruded upon by that latest development of science—electricity. This successful intrusion has been effected by the electrical tanning process of L. A. Groth of London, which our London contemporary *Iron* recently inspected in operation at the tannery of Tehbit Brothers, Bermondsey.

In order to realize the benefits this new process promises to confer on the trade, we may observe, says *Iron*, that ordinarily the green hides are steeped successively in pits containing tanning liquor of varying quality, weak at first, but gradually increasing in strength. This steeping process occupies, on the whole, from three to four months, and requires a large number of pits. By the aid of Mr. Groth's process, however, the time required for steeping has been reduced from months to weeks.

The apparatus used in the new system is very simple, consisting only of a circular tank within which is a framework of wood on which the hides to be tanned are stretched. The tank is filled with tan liquor, which is kept warm, and the frame with the hides is caused to revolve at a moderate speed to keep up the necessary agitation. In the ordinary system this agitation is performed at intervals by hand. A current of electricity is conducted to the tank, the two poles from the dynamo entering it from opposite sides. By means of internal conductors the current is passed through the tanning liquor, and acting upon the hides, the process of tanning is greatly quickened. The time occupied in treating the hides is two weeks, as against the three or four months occupied in the ordinary process. The great saving in time effected by the new process is due

to the circumstances that electricity facilitates the union which takes place between the tannin of the bark and the gelatine of the hide during tanning.

The new process has been in use with one set of apparatus (which is said to take the place of from 30 to 40 ordinary pits) at Tehbit's tannery for about 12 months. The results of working give every satisfaction, and lead to the conclusion that the great aim of the tanner—which is to get the largest outturns possible at the lowest cost and in the shortest time—can now be realized beyond his anticipations.—*Ex.*

ELECTRICITY IN MINING.—One of the greatest aids that electric power has of late been called upon to enter is that of mining, remarks the *Electrical World*. The use of the electric light in mines is not new, and possibly its success has helped create the demand that has sprung up for power appliances. Be that as it may, there can be no doubt as to the reality and extent of the demand, and vast as are the fields already opened up for the electric motor, it may seriously be questioned whether the opportunities in mining, the latest sphere of its occupation, do not surpass all others. We believe that 1890 is destined to be the conspicuous year as the starting-point of electric mining on the grand scale, as 1889 was for electric railroading. One cheering feature in connection with the new departure we have thus distinguished is the hearty welcome accorded the new power by the mining journals, mining experts, and the mining world in general. There has been at once an absence of prejudice and a keen appreciation of the advantages that electricity can give, and it now depends upon electrical inventors and electrical engineers to rise to the occasion and reap the rewards that await ready ingenuity and honest work. They may form some idea of the immensity of the field from the fact that the value of American mining products in 1888 exceeded \$590,000,000, and during the past year the industry has been no less prosperous. It is the province of electricity not only to aid in the economical and safe production of this great wealth, but to bring up to the point of remunerative productivity hundreds of mines that are worthless under other conditions.

AN ELECTRIC ALARM COMPASS.—An alarm compass, the invention of a Boston man, sounds an alarm if the vessel is allowed to get off her course. Electricity is brought into play to accomplish this.

ENGINEERING NOTES.

ECONOMY VS. SPEED.—The tendency in Atlantic steamers has for a long time been to sacrifice economy to speed; but a new departure is indicated in one of the new boats of the Hamburg-American line, the *Scandia*, which uses only 58 tons of coal a day. In very good weather she can make 14½ knots an hour. Allowing for an average of little less than 13 knots an hour, or say 290 knots a day, she can travel five miles on one ton of coal, and her cargo space enables her to carry 4000 tons of freight, so that with one pound of coal she can carry a ton of freight ten miles. Probably this has never been surpassed in point of economy, and still less equaled.

TO BRIDGE THE BOSPHORUS.—The latest engineering scheme is a bridge for the straits of Bosphorus, by which direct railroad communication will be made between Europe and Asia. The plan comprises nothing less than the construction of a colossal bridge 872 yards long over the historic and picturesque channel that flows between the shores of Europe and Asia. It is stated by the Paris correspondent of the *London Telegraph* that the French engineers who are thinking of undertaking the construction of the bridge would make it with one arch only. This done, there will be no more need of the Leander-like or Byronic swimming across this historic channel.

THE NIAGARA FALLS PRIZE.—A device for utilizing the power of Niagara Falls, invented by a Chicago engineer, has been awarded the gold medal offered by the Buffalo International Fair for the best invention for this purpose. The device consists of an overshot wheel 60 feet in diameter, to be mounted behind the falling sheet of water, and moved by proper machinery toward or away from the waterfall as the power is needed. The wheel is to drive dynamos by friction-clutch connections, and the power will be transmitted by wire to any desired place. There were over 150 competitors for the prize.

ENGINEERING PROGRESS.—Within the next ten years, some of the grandest pieces of engineering ever conceived will be started. Bridge building has commenced which, if talked of now, would be regarded as chimerical. Houses 15 to 20 stories high will be built. Tunnels are to be built under cities. Pneumatic tubes will be constructed to carry passengers three miles per minute. These schemes all exist in the minds of engineers, and are being worked out into practical shape.

TEXAN HARBOR IMPROVEMENTS are to be pushed at the Washington end. Senator Coke has already introduced a bill asking for \$6,000,000 for Galveston. Bills have also been prepared by the friends of the Corpus Christi project.

SAN FRANCISCO:

Saturday, February 15, 1890.

TABLE OF CONTENTS.

EDITORIALS.—The Fulton Rock-Breaker, 109; Passing Events; Influences on Silver; The Industrial Situation; Reopening a Caved Mine; Miners' Tools; Mineral Lands and Railroads; Drift Mines and the Laws, 117; The Pump and its Cussedness; A Coal Boiler; Blue Canyon in Winter; Rolled Steel Beams; Occurrence, 118.

ILLUSTRATIONS.—Fulton Rock-Breaker; Section of Mine Showing Ore-Pillars, 109; Scene at Blue Canyon, on the Central Pacific R. R.; Coal Boilers for Fast Yachts and Torpedo Boats, 118.

CORRESPONDENCE.—The Golden City Mining Company; A Big Gold Ledge; Rains of Fish and Reptiles; The Stewart Mining Bill; Traction Engines, 110; MISCELLANEOUS.—Professors and Miners; The Charleston, 110; Not All Fancy; Montana and Michigan Copper; The Late Chester S. Lyman; Electrical Society; Copper in the United States; Making Good Citizens; Road Work; Nicaragua Canal, 111.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 112-113.

MECHANICAL PROGRESS.—The Progress of Invention; The Plate-Glass Industry; Movement of the Iron Center; Electric Doors; The Longest Light Circuit; The Uses of Common Salt; Electricity from the Wind; Rigidity in Bridge Work; Comparative Cost; Miscellaneous, 114.

SCIENTIFIC PROGRESS.—Air in Water; The Bee's Sting a Useful Tool; The Latest from Edison; Sulphate of Copper; The Telephone; Miscellaneous, 115.

GOOD HEALTH.—A Labor Fallacy; Our Houses and Fatal "Colds"; Fainting; Remedy for Perspiring Feet, 115.

USEFUL INFORMATION.—Manufacture of Japanese Lacquer; Coconut Butter; Why They Do It; Absence of Fish in the Yellowstone Park; Teakwood a Preservative of Iron; Miscellaneous, 116.

ELECTRICITY.—What is Electricity; Electrical Mining; Electricity in Mining; An Electric Alarm Compass, 115.

ENGINEERING NOTES.—Economy vs. Speed; To Bridge the Bosphorus; The Niagara Falls Prize; Engineering Progress; Miscellaneous, 115.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 122.

Passing Events.

The mines which were closed down during the recent stormy weather are gradually resuming operations and putting the men to work again. Most of the roads in the mountains, however, are still in bad condition, making it hard for hauling ore or supplies.

The big mill at the Stonewall mine, San Diego county, belonging to Governor Waterman, has been completed and is the heat in Southern California.

The sale of the Mountain mine, Sierra county, to English capitalists is a good thing for that section. The old Sierra Buttes mine, on the opposite side of the Buttes, and owned by an English company, was the mainstay of that region for many years. English mining investors usually put up good works and give steady employment to many men.

Railroad men are still busy clearing their tracks, repairing bridges and filling washouts, employing large numbers of laborers. The loss of so many bridges all over the coast will keep the bridge-makers busy the coming season.

LATEST ADVICES from South Africa state that at Johannesburg a wonderful strike of quicksilver has been made. It is eight or ten feet from the surface, with every indication of going down. No discovery of greater importance to the gold industry could be made, and the greatest interest is being aroused. The entire gold product of South Africa in 1889 was \$9,000,000.

Influences on Silver.

The decline in silver is a source of surprise to many bimetallicists, but so far as we can learn, it does not discourage them in their efforts toward securing free coinage from our Government. A tabulated compilation of the lowest and highest prices by years, for 20 years past, in the London market, does not warrant the least degree of uneasiness as to the final outcome, owing to prices showing a marked advance over about one year ago. The table as given by the *Iron Age* is as follows:

Year.	Lowest.	Highest.	Average.
1870.....	60½	60½	60 9-16
1871.....	60 3-16	61	60 5-16
1872.....	60 1-16	61½	60 5-16
1873.....	60 1-16	61½	60 5-16
1874.....	60 1-16	61½	60 5-16
1875.....	60 1-16	61½	60 5-16
1876.....	60 1-16	61½	60 5-16
1877.....	60 1-16	61½	60 5-16
1878.....	60 1-16	61½	60 5-16
1879.....	60 1-16	61½	60 5-16
1880.....	60 1-16	61½	60 5-16
1881.....	60 1-16	61½	60 5-16
1882.....	60 1-16	61½	60 5-16
1883.....	60 1-16	61½	60 5-16
1884.....	60 1-16	61½	60 5-16
1885.....	60 1-16	61½	60 5-16
1886.....	60 1-16	61½	60 5-16
1887.....	60 1-16	61½	60 5-16
1888.....	60 1-16	61½	60 5-16
1889.....	60 1-16	61½	60 5-16

The new year opened at 44½ per ounce of 925 fine, steadily advanced until on Jan. 27th the quotations came through at 44½; since then the price has declined until it is to-day 43½.

The strength of the market in last year was based on several influences—First: Renewed agitation the world over in favor of bimetallicism. Second: Enlarged requirements from India—reaching a little over the equivalent of \$30,045,000 against nearly \$20,000,000 in 1888. Third: The English Chancellor of Exchequer buying silver for coinage so as to make payments in that currency as far as possible to employees. Fourth: The French Government coining some, chiefly for one of its colonies. Fifth: The impression that the present administration in this country would redeem its pledge by legislating in favor of silver. Sixth: Toward the close of the year, by reports abroad that the Bank of England would issue £1 notes against silver coin or bullion, the demand for which would outstrip that for the higher denomination.

The influences this year to depress silver are, as far as obtainable, as follows: First: The Russian Government again entering the market as a borrower, which may possibly cause the trouble to again become speculative and taken in lieu of silver by the Germans, English and French having dealings with Russians. Second: A growing impression that the administration in our country is opposed to the remonetizing of silver or to any bill looking to the raising of the metal from a commercial commodity. Third: Confirmed advices denying that the Bank of England would issue £1 notes against silver held by it. How such a report as the bank preparing to issue the notes gained credence is hard to say, for the institution could only do so by Act of Parliament; but it can retain part of its reserve in silver, and not all gold, as it now does.

The bimetallicists have the strongest fight to make against monopolists and heavy speculators whose moneyed power admits of their reaching out in all directions to prevent the remonetizing of silver. It is an open secret that all successful deals are worked through money manipulation, for a scarcity of coin puts it within the control of a few to unduly inflate or depress the prices for any speculative commodity. J. K. Armour's most successful corners have been worked in this way; so have many stock and other speculative movements at the East and also abroad. What do unscrupulous, moneyed speculators care for the debtor or any other class as long as they can, by making money scarce or plentiful, coin money through successful speculative movement? As hearing to some extent on the above, we give the following from the *London Weekly Bulletin*:

Many people think the present position of gold as serious, and it may be so. At any rate it is certain that a 6 per cent rate has failed to bring money into the country, and we doubt if even a 7 per cent rate would do much better. The fact is that our banking laws are all founded upon gold, and the entire community is at the mercy of a few individuals. If Rothschilds, Barings, and a few other big firms chose to-day to combine and draw a couple of millions from the Bank of England, what a "quilt" there would be! The 1866 panic would not be in it. Yet they could do it to-morrow if they liked. We would not care to have speculative

accounts for the rise open anywhere at the moment. Bulls or bears are dealing not on intrinsic values, but simply on influx or efflux of the precious metal.

The Industrial Situation.

During the last two months of 1889 and the first one of this year, there has been more or less of an industrial depression on this coast. The long-continued and severe storms prevented nearly all outdoor work. In the country scarcely anything could be done for weeks and weeks. Then came snow blockades, freshets, the washing away of bridges, and impassable roads, all of which put a stop to transportation by rail or by road. As a result, laboring men have suffered more or less by reason of lack of work. In the cities, the carpenters, painters, brickmasons and builders have had little or nothing to do; and others who earn their living outdoors, such as expressmen, sewer and cable-road builders, street laborers, etc., have been idle for a long period. The end of the great storm brought a short period of good weather, which, however, has not lasted long enough to bring about any activity in the lines mentioned.

Building operations in the city came practically to a standstill, and this was also the case in some other departments of trade. The foundries have been working short-handed by reason of lack of orders due to the weather and the roads. Very little machinery has been shipped from here of late for these reasons.

Now that the "back" of the winter has been broken, these conditions will speedily change. As the days lengthen, building operations will start up afresh and all business will show renewed activity. The necessary repairs to railroads, the building of new bridges, etc., will give employment to many men for months to come. Mining operations here and in Nevada are being resumed as facilities for ore transportation are again obtainable.

Those engaged in agricultural pursuits look for a prosperous season to come. The miners also are hopeful. There will be an abundance of water everywhere for power, and while there is temporary inconvenience from surplus water now, the final result will be beneficial. We will all have to make up for time lost this winter, so that all branches of trade and business must soon be pushed actively.

Gold in Suspension.

In crushing "refractory" gold ores, as a rule, the portions of the ore containing the largest quantity of mineral are by far the most brittle. Large quantities of "slimes" are made especially with ores holding metallic sulphides in large lumps, owing to the crystalline and friable structure of such metallic bodies, the valuable metal is apt to be very finely divided after crushing. Minute metallic grains will be found in this pulp under the microscope. Florence O'Driscoll, in his "Notes on the Treatment of Gold Ores," says this can be demonstrated in this way:

Put a piece of mineralized ore into an ordinary mortar and give it a few blows and turn it with a pestle; the result will be a few lumps of ore and gangue, a proportion of sand-like size, and also a quantity of fine dust. Throw half of this into a long glass test tube; a large proportion of the stones and metal will sink to the bottom at once, the sand will settle slowly, the dust very slowly, and in most cases the water will be discolored; this discoloration is caused by particles of mineral held in suspension in the water, and too minute to be discerned by the eye.

Then the other half of the ore can be treated in the mortar to sizes common in the treatment of gold ore, say to pass a 40-mesh screen; then throw these crushings into another test-tube and observe the result. Most frequently the water will be highly discolored, and remain so for days, and the crushings will find their way to the bottom, according to their relative weights, which, broadly speaking, is more governed by size than density. If this discolored water be poured off and allowed time to settle, the sediment would give a far higher return of metal than the coarser parts of the ore, which fall to the bottom quickly. Such sediments form the "slimes."

THE estimated consumption of copper in the United States last year was 75,500 tons.

Mineral Lands and Railroads.

The people in Montana are having the same kind of trouble about mineral lands on railroad grants that we are having here. But the miners there have handed together to fight for their interests and rights, while here the contests have been made by individuals. The railroad company has been victorious in California, and the recent Eagle-Bird decision has virtually given it large tracts of mineral land, which it was probably not the intention of Congress that the company should have.

The miners, prospectors, and mine-owners of Montana have taken the matter in hand as a body to prevent the loss of millions of acres of the best mineral land in that State. A Mineral Land Association has been formed, the officers of which keep a close watch on the movements of the railroad company, and are bringing the attention of Congress to the evils likely to result from the railroads getting possession of the tracts of mineral land.

Mr. Merrill, the secretary of the association referred to, in a letter to a locator states that there is actual danger of the Northern Pacific Co. securing title to several valuable mineral tracts. In this letter he says: "The section you refer to has been selected and certified for patent to the N. P. R. R. Co. by the United States land office at Helena. These patents have been withheld from this railroad company for two years by the efforts of the mineral-land convention of Montana through its executive committee, and the only hope now of saving these lands to the people of Montana as mineral lands is the work of the Mineral-Land Association of Montana to secure necessary action from Congress and the reserving forever all the mineral that is or may be found in all this mineral land."

It is to be hoped that the California delegation in Congress will be active in aiding the Montana men in having this subject thoroughly ventilated. The Government intended to reserve the mineral land from railroad grants, whatever the technical language of the Act may say. Congress should give the subject immediate attention, as it is of the highest importance to the mining industry.

Drift Mines and the Laws.

In the upper mining counties petitions are being circulated praying for an amendment to the Stewart bill which will enable companies owning drift mines to expend the amount of money required for annual work on a claim at one point when two or more claims are consolidated, instead of upon each location. In these drift mines very long tunnels have to be run, as the gravel beds are under the lava-capped "divides," or ridges. The making of these tunnels is a matter of very great expense, and if only small tracts of gravel could be worked by each tunnel, it would not pay to run them. The companies generally own several claims, and the work to develop them all is done on the tunnel itself. A number of claim-owners working together may develop paying properties, but if money must each year be spent on each location, it will work a hardship.

In fact the laws as at present framed, and those proposed, rather ignore the drift-mining industry. The conditions surrounding its development differ from those concerning quartz or hydraulic mines. The drift miners of California have, however, called the attention of Senator Stewart and other Pacific Coast representatives to their needs, and it is probable that their petition will have weight and be properly considered.

Reopening a Caved Mine.

In the Tilly Foster mine, Putnam Co., N. Y., they sank on the ore body from the surface to the 165 foot level, leaving ore pillars to support the hanging-wall, the vein being over 100 feet wide and the overhang in places nearly 50 feet. The pillars gave way and the top caved. They had then to strip the ground right down to the 165-foot level at all points. In some parts of the mine, where the greatest width of ore body occurs, as shown in the cut, the stripping must go even deeper. Some idea of the length and breadth of the lower ore pillars in this mine may be obtained by reference to the cut (see page 109). The new hanging-wall slope varies from a vertical position to an inclination of one foot horizontal or six feet vertical.

The Pump and Its Cussedness.

The holler feed-pump is a good deal like a man's heart; there is not much of it, but it is very important that it be in perfect condition, because if anything happens to that, the power stops, the machine is out of service. There is this further thing about the feed pump, though, that whereas the stoppage of the pumping action of a man's heart wrecks only the machine to which it is connected, the stoppage of a feed-pump may cause damage to neighboring people and property.

The pump is like a man's heart in another thing; it is liable to get "withering" at times, making short or long strokes, or seeming to be forcing wind, or to be knocking too hard, from some slight derangement perhaps not readily placed. Such tricks are annoying, and if let go too long may be dangerous.

There is this further analogy between the pump and the heart: That the cause of the trouble is generally about as hard to determine by inspection in the one as in the other. The working parts are less exposed to view or open to inspection in these two pumps, the one of muscle and the other of iron, than in the other machines and apparatus with which they connect.

If a man's stomach is out of order, the thing gives some indication; if his throat is affected, it can be inspected; but the heart has to be doctored from hearsay evidence and by feeling. So, while the boiler and the engine can be quite well inspected and repaired, the pump generally has a lot of hidden parts and passages, the inside of which no one has ever seen and no one will ever see so long as the machine is running.

Of course when the human machine is put in the scrap-heap, any one who knows how to dissect may tell what was the matter with the pump that it did not run right. Sometimes these lessons are of use when some other human blood pump gets to pounding; but as a general thing the doctors and engineers are in the dark about most of the trouble with the two feed pumps, the one of muscle, and the one of iron.

This makes it all the more desirable that whoever has charge of a pump of any kind, especially if it be used to feed a steam boiler or to do any other duty where much depends upon its effective and continuous action, should very carefully study the action of his own and other pumps, so that the moment anything happens he will be able to know, first, what is wrong; second, what would be the result if it be allowed to continue; and third, when and how to cure the trouble.

You may find old engineers who never have any trouble setting their engine valves, but who will send for the pump-doctor the moment anything commences to knock, or slip, or give any sign of doing anything different from what it ought to be.

You will find an engineer who has been working on one job, where there is a certain make of pump, commences asking questions the minute he strikes a run where the pump is different; and as a general thing he will get down there on the first Sunday, if he takes charge of the plant (and sometimes upon the Sunday before), and take things down and do some regular old-fashioned thinking.

Once in a while you will find some very fresh young man, or some old "know-it-all," who will not think it necessary to find out anything more than where the throttle and the drips are; but a good man, who feels that he has his own life in his hand, and with it the lives and property of others, and the livelihood of his children—such a man is not taking any risks nor getting in any more holes than he can help about "the heart of the engine-room"—the pump.

There is one snag, however, against which whoever loquies into the action of pumps runs early in his tramp for knowledge in this connection; there is but very little literature upon the subject. He cannot book-up in this line as

he can in other departments of his business. He can buy countless books upon the steam engine—some good, some bad, many indifferent, and the same way about the boiler—but when it comes to pumps, there is very little to be

ning. This leaves a common experience upon the floor of societies where candidates are being examined as to their competency for admission to membership. If the questioning gets to running in the direction of pumps, the candi-

out of hours those of the neighbors who know less about pumps than he does, and who yet do not care to "give themselves away" by sending for the regular pump-doctor, who will send in a bill to the firm.

A Coil Boiler.

On this page are out of a coil boiler, of the type used in modern torpedo and steam launches where high speed is desired. By means of a pump, water is forced through the boiler, which consists of a series of pipes so placed and connected as to form, practically, one continuous length of tube, into the upper and cooler portion of which water is admitted, and from the lower and hotter portion of which the steam is led away. Steam is led from the lowest set of tubes to the "separator," which allows the steam and water coming from the boiler to divide—the latter, of course, collecting in the bottom. This bottom is connected with the pumps so that when necessary the excess of water can be returned to the boiler.

The boiler generates steam only as it is needed and utilized by the engine, the only reserve or surplus steam being that contained in the separator, the lower sets of tubes, and in the connecting pipes. This form of boiler is, of course, a very rapid generator of steam, and is thus especially adapted for very fast yachts and torpedo boats such as the Herreshoff Bros. build and send all over the world.

Blue Canyon in Winter.

We give on this page a view, made direct from a photograph by Taber, of a snow scene up in the Sierras during the recent snow blockade on the Central Pacific Railroad. The scene is at Blue Canyon, at which point the first of the snow-sheds is encountered on the way East. Beyond the figure of the man is seen the snow which has been shoveled back from the track, and on this side the snow-bank through which the rotary plow and the shovelers had to cut a way for the trains. Blue Canyon is a small settlement, and one may see from the view how little chance the people had to get about during the storm. The snow has not yet gone, by any means, although the railroad is open. The people in the mountain towns have had a surfeit of snow this year, and will be glad to see the ground around their houses once more.

ROLLED STEEL BEAMS.—At the meeting of the Board of New City Hall Commissioners, a communication was received from John Wright, Peter H. Jackson and August Leon, the committee selected at a previous meeting to report on the comparative cost of built steel-plate girders instead of rolled steel beams of equal bearing. They informed the board that after a careful examination of plans on Contract 17 for constructing a portion of the steel-work on the northeast wing, they had concluded that a built-up girder of equal strength to the 24-inch rolled steel beams would involve an additional expense of 20 per cent. Steel beams of the required kind cannot be obtained in this city.

OZOCERITE.—During 1889, the product of ozocerite or "mineral wax," from the Utah mines was approximately 130,000 pounds, as compared with 65,000 pounds in 1888. The foreign market has been greatly excited on account of the absorption by English hospitalists of the greater part of the Galician deposits. Within the last six months of the year the price of the material has advanced. Ozocerite is a mineral wax composed of 85 per cent carbon and 15 per cent hydrogen and is extensively used in the arts.

THE BOARD OF REGENTS of the State University has appropriated the sum of \$100 to be added to a donation of \$200, given by the American Association for the Advancement of Science, for the purchase of a spectroscope for the Lick Observatory.

WATER WHEELS, windlasses, derricks, sluices, etc., are found on the beach at Crescent City, indicating loss to the miners on the Upper Klamath or Trinity rivers by the recent high waters.

THE GOVERNOR has appointed Wm. S. Wood of this city a trustee of the State Mining Bureau, vice W. T. Garratt, deceased.

AUGUSTUS PETTIBONE, Sup't and general manager of the Standard Consolidated mine, died at Bodie on Monday.

SCENE AT BLUE CANYON, ON THE CENTRAL PACIFIC R. R.

found in the papers upon the subject, and very much less bound up in book-shape.

So far as we know, there are but two books published upon pumps—one of them by an Englishman, and intended for those who are designing pumps; the other by an American and

date is uniformly found to fall in a large proportion, and in fact it is matter of common knowledge that a man may be very readily rejected for utter ignorance, if those who are examining him know where he has run and what kind of pumps he has had. If he knows only

COIL BOILER FOR FAST YACHTS AND TORPEDO BOATS.

meant for those who are setting up and running them; and both of these have been put upon the market within the last two years.

We often find a man who has been running plants where they had certain kinds of pumps, get stuck when he moves into another State and has to be examined for a license. He will get along all right and swimmingly as long as the engine and boiler are the subjects of examination; but when it comes to the pump, he gets stalled the minute he is asked about some other one than those which he has been run-

the Knowles, the Dow and the Deane, he can be floored by asking about the Worthington, the Hooker and the Davidson, and so on.

Let each one of our readers make up his mind that his present or next job may depend upon his knowing thoroughly not only those pumps which he has under his charge, but all the other principal ones upon the market.

With such knowledge as this a man may not only feel himself much more valuable under fire of an examining committee, but earn a good many extra dollars at odd times, helping

A Mistake in Identity.

EDITORS PRESS:—The paragraph in your paper of February 8th, referring to the death of John J. Dorsey, and his connection with the Maryland mine of Grass Valley, is totally incorrect.

The fact of Sam'l P. Dorsey's name having been on your subscription-books since your first issue, should have prevented the mistake in identity, and also the comments upon the management of the Maryland mine. SAM'L P. DORSEY.
Grass Valley, Feb. 10th.

[We are very glad indeed that the paragraph referred to was incorrect, although there were others in San Francisco who labored under the same impression. No "comments" upon the management of the mine were intended. It was said it had never been properly opened or developed, by which was meant that no large capital had taken in hand and equipped the mine in a first-class way, for we had understood some time since from Mr. Dorsey himself that he was desirous of aid in that direction for that purpose.—EDS. PRESS]

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by tending their influence and encouraging favors. We intend to send none but worthy men.

THE *Homer Index* is responsible for this: An enterprising individual made a mining location in Lake canyon recently, and at one end planted a pole in a snowdrift 50 feet deep. The other end he could not get to, but seeing a coyote sitting on a shelf of rock about the right distance off, he took him for the north lode line monument, which fact he stated in the notice that he posted on the pole. The animal will, of course, stay there, and see that no one jumps the claim.

THE January pay-rolls of the Comstock mines amounted to \$158,107.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1.
SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Tables of Contents:

Preface; Introduction; Implementos; Assay Balance; Materials; The Assay; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Fasting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 190 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75 Sold by DEWEY & Co., Publishers, No. 220 Market St., S. F.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, burdy-gurds, rockers, underscreens, etc.; also describes methods of blasting, tunnels and sluices; tailings and dump duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 220 Market St., San Francisco.

Assessment Notices.

Gray Eagle Mining Company. Location

of principal place of business, San Francisco, California.
Location of Works, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 21st day of January, 1890, an Assessment, No. 16, of Four (4) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-fifth (25th) day of February, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 17th day of March, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary,
Office, Room 11, No. 303 California St., San Francisco, California.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the
"Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, \$3.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formula as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Great Variety of SHOT GUNS, RIFLES,
etc. Breech-Loaders from \$4 to \$100.

Manufacturers of

Sheet Iron and Steel Pipe

ALL SIZES.

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

Individual Property Rights.

Webster defines socialism as "a social state in which there is a community of property among all the citizens." It is not in the line of our present purpose to give any special attention to the various theories that belong to this general class. Though widely different in some respects, they all have a family likeness. They all aim at the same thing, the destruction of individual property rights. That private property is robbery is the general slogan. When we remember the fate of the Zares, the New Harmonies, Brooke Farms, Oakdales and various phalanxes that have been tried, we have increased respect for the rights of private property, and however much we would like to see change and reform in the present order of things, we do not care for a millennium that has to be sponsored by a sort of hothouse process.

"History," says Carlyle, "is philosophy teaching by example," and it is only by the light of experience that we can thrir our way through an untraveled wilderness. Now it is a world-wide experience that civilization advances only so far as the right of private ownership is respected and secured. Adam Smith once made the remark that the security afforded to property in England had more than overbalanced all the faults and blunders of the Government. And there cannot be the shadow of a doubt that the wonderful growth and prosperity of the United States is owing to the safeguards that have been thrown around the sacredness of property. Even the Government will not take a shovelful of soil from any owner without rendering a just compensation. On the other hand, just in proportion as property is insecure, has been the tendency to barbarism. This fact is so obvious that it would be a waste of time to attempt to prove it, and yet we have a lot of charlatans in political economy that would burn the patent office, the courthouse and Hall of Records, upset the Civil Code and our whole system of jurisprudence, get into a covered wagon and move back to the woods.

Then all history teaches that only so far as a man is certain to enjoy the fruits of his toil will there be any stimulus to production, thrift and enterprise. In all parts of the world where property is liable to be seized by some petty tyrant or roaming freebooter, production, trade and commerce are found to exist only in the rudest and most primitive condition. Henry George's theory of the Governmental ownership of the land is already in force in some parts of Asia and Africa, and what is the result? Why, there is no fixed property only of the rudest kind. Valuables are hid in the earth or carried away to places of safety. We refer to Henry George at this point for the reason that his single-tax merely masks under a plausible veil of rhetoric a scheme for the confiscation of all private property in land. He says in the opening of Chapter III, Book VII, of "Progress and Poverty":

The truth is, and from this truth there can be no escape, that there is, and can be, no just title to an exclusive possession of the soil, and that private property in land is a bold, bare, enormous wrong, like that of chattel slavery.

And further on in the same chapter:

And by the time the people of any such country as England and the United States are sufficiently aroused to the injustice and disadvantages of individual ownership of land to induce them to attempt its nationalization, they will be sufficiently aroused to nationalize it in a much more direct and easy way than by purchase. They will not trouble themselves about compensating the proprietors of land.

Now this means a forcible seizure and robbery. Nationalization may have a softer sound, but it means the same thing, and our ethics teaches us it is just as bad for a Government to steal as the individual. It is true that the fertile fancy of the writer evolves a very pretty Utopia as brilliant and evanescent as the paradise of the opium-eater. Whenever the ideal millennium comes, if it ever does, and all men love their neighbors as well as themselves, there will be little use for law and government; but as long as self-interest is the mainspring of action, and it is likely to be till human nature undergoes a radical change, it will be necessary to define and protect individual right to property.

THE Virginia Chronicle says: "The daily ore yield of Comstock mines is now up to the normal average of 1000 tons, and by March 1st will exceed that amount. The hullion product of that quantity of ore does not fall short of \$20,000, aggregating \$600,000 monthly, and the yield of the lode of the current year is expected to exceed \$3,000,000."

THE old Con. Virginia shaft and the Hale and Norcross shaft on the Comstock are not in very good working order, owing to the steady movement of the ground, and men are at work repairing them to admit of the free movement of the cages up and down the shafts.

AGENTS of Lord Francis Godolphin Osborne of Glengora, Berkshire, England, have purchased a group of mines on the San Pedro river, near Dudleyville, Arizona, for the sum of \$500,000.

CHILI exported last year 23,500 tons of fine copper.

List of U.S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING JAN. 28, 1890.

420,227.—DEVICE FOR SWINGING SLIDING SASHES.—S. R. Deacon, Los Angeles, Cal.

420,550.—CABLE DEPRESSING MECHANISM.—F. G. Stillman, S. F.

420,841.—PERMUTATION LOCK.—Ada H. Van Pelt, Oakland, Cal.

420,752.—COLLAR FOR PAN DRIVERS.—T. A. Washburn, Gold Hill, Nev.

420,484.—INSTRUMENT FOR COPYING DRAWINGS.—R. W. Whitney, S. F.

420,755.—APPLIANCE FOR SPINNING TOPS.—F. E. Williams, Alhambra, Cal.

420,648.—INSULATING COMPOUND.—J. B. Williams, S. F.

The following brief list by telegraph, for Feb. 11, will appear more complete on receipt of mail advices:

California.—William P. Walling, Santa Monica, elevated carrier; Peter H. Flynn, Los Angeles, safety-bolt for whiffletrees; George E. Foster, McPherson, check-book for barbers.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CALENDAR CLOCK.—Peter F. Nilsoo, Phoenix, Arizona. No. 420,519. Dated Feb. 4, 1890. This invention relates to the class of automatic calendars and especially to that class used in connection with clock mechanism. It consists in fixed guides or supports on which are mounted separate calendar cards or tags, springs tending to force said cards or tags forward, and oppositely reciprocating guard-plates operated by the clock for holding the cards or tags upon the guides, and relieving them in such a way that one shall be forced off the track every 24 hours.

DENTAL PLUGGER.—Henry Craigie, S. F. No. 420,532. Dated Feb. 4, 1890. The patent covers certain constructions and combinations in the class of dental pluggers.

GATE.—John W. Bain, Gonzales, Monterey Co., Cal. No. 420,489. Dated Feb. 4, 1890. This is an automatic farm-gate arranged with a different mechanism from those in common use.

THRASHING MACHINE.—Benjamin Holt, Stockton. No. 420,512. Dated Feb. 4, 1890. This improvement in thrashing machines consists in the application to the shaft of a thrashing machine of a frictional clutch mechanism intermediate between the cylinder shaft and the driving gear with its frictional surfaces normally held together, so that in case of any sudden stoppage or check in the motion of the cylinder, this intermediate clutch will slip sufficiently to relieve the driving gears and prevent their breaking.

MITER-BOX.—Frank V. Carman, Oakland. No. 420,530. Dated Feb. 4, 1890. This is one of that class of miter-boxes in which a swinging leaf, adapted to receive and guide the saw, is employed, said leaf being vertically adjustable to receive different thicknesses of work and adapted to be fixed at any suitable angle to make the cut desired. The patent covers the peculiar construction and combination of parts.

LATCH AND LOCK COMBINED.—Henry O. Hooper, Eureka, Humboldt county, Cal. No. 420,600. Dated Feb. 4, 1890. This invention is especially designed to combine a door-lock and latch in one article. It consists of a hollow spindle to which the door-knobs are at-

tached, said spindle having a projection upon one side which engages the latch-bolt so as to withdraw it when the door is to be opened, and in combination therewith of a spirally threaded shaft lying within the hollow spindle and engaging a point or projection within it, so that when the shaft is rotated it is caused to travel longitudinally within the spindle. This movement is effected by means of a key of any desired construction, which is introduced into the end of the knob, and the shaft carries a slide which has a projection extending out through a slot in the side of the spindle, so as to lock the latch and prevent its being withdrawn when thus engaged.

PORTABLE ASH BASKET.—Elizabeth J. Lincoln, S. F. No. 420,559. Dated Feb. 4, 1890. This portable ash-basket consists of a movable foraminous receptacle, which is placed within a grate for the purpose of containing the ashes produced by the burning of the fuel, and in connection therewith of handles whereby it may be removed. The basket is placed within the grate before any fire is made. The material for the fire is put in the basket and lighted the same as in an ordinary grate. The basket retains the ashes, etc., and is lifted out of the grate with the ashes, put in a suitable box, and carried out without any dust or dirt being made.

ADJUSTING COLLAR FOR PAN-DRIVERS.—Theo. A. Washburn, Gold Hill, Nev. No. 420,752. Dated Feb. 4, 1890. This is a novel collar encircling the shaft and carried by the driver of amalgamators, settlers, etc. The collar consists of a metal ring having a groove in its periphery. The collar is feathered on the shaft so that it will slide up and down on the shaft as the shoes and dies wear. The collar lies within the drivers, and through said driver pass three set-screws into the peripheral groove of the collar so that it will move up and down with the driver. The object of this collar is to prevent the driver and the muller from swinging out of their regular course. New drivers often awing from the very first, even though they are bored to it closely to the shaft. They get worse by use, until the shoes of the miller will be worn out on one side while those on the opposite side will not be worn more than one-half. When a pan is thus faulty it will not do good work, and there is also a great waste of iron; but by the use of this adjusting collar the driver is held true to the shaft and will not swing out of its course. The collar being a separate piece, can be readily renewed when necessary.

CHART, READING AND NUMBER STAND.—Fannie L. Matson, San Jose. No. 420,560. Dated Feb. 4, 1890. This is an improved device which is especially adapted for use in schools to support cards or numbers; also for maps, charts and other papers for the purpose of instructing in schools. The present invention is designed to provide a simple knockdown stand or support for various maps, number or word charts and such other matter as may be useful for the purpose of instruction.

SUGAR-CANE SLICING MACHINE.—John N. S. Williams, Honolulu, Hawaii. No. 420,427. Dated Jan. 28, 1890. The object of this invention is to provide a cane-slicing machine of great capacity, simple in construction, and not liable to get out of order. The cane is sliced so as to prepare it for diffusion.

Sierra City.

Sierra City's outlook for 1890, says the *Tribune*, is better than it has been for a long time. There has been a great depression in every kind of business here for over a year past, which is owing mainly to the unscrupulous management of a number of mining prospects. This is unquestionably the principal reason. We, nor anybody else, know no other cause than that men with capital have been humbugged with infernal prospects so much lately that they became really afraid to invest when they were offered a good mine and guaranteed a square deal. Capital is just the thing a place like this needs, but so long as mines that are known could never be made to yield an ounce of gold are palmed upon capitalists, the place will always suffer for the want of it. We know that Sierra City has some poor prospects as well as other mining districts, but we believe that this district has more good mines and fewer poor ones than any other place that can be mentioned.

The reason that we have to believe that Sierra City will be a lively town in the spring is because the following mines will be in operation then: The Young America, with 160 men; Mountain Lodge, 150; Sierra Buttes, 50; Marguerite, 60; Cleaveland, 40; Salinas and Mercer, 30; Chips, 25; California, 10; Northern Belle, 10; William Tell, 10; Butte Saddle, 25; Crowell & Co., 20; besides several other small mines that work from five to eight men. It must be remembered that the mines mentioned above are right in and around Sierra City. We could mention numerous others that lie in Gold Valley, only a few miles from here, that help the town more or less.

OIL IN FRESNO.—Oil has been struck in a well 15 miles west of Huron. The flow is a large one and the oil of good quality. The property belongs to a Los Angeles company, William Leete being at the head of the enterprise. Several other wells will be bored next spring.

The Fulton Rock-Breaker.

(Concluded from page 109.)

ont, as the crushing of the rock upsets the wrought-iron bars and thus tends to force them still more firmly within the band. The shoes and dies, after becoming worn on their lower faces, can be reversed, thus greatly increasing their life. These shoes and dies, wherever used, have given excellent satisfaction and will wear longer than steel.

The distance the jaws are set apart is regulated by means of wedges at the back of machine, which can be easily and quickly adjusted by one nut and while rock-breaker is in motion. The seats in which toggle joints work are of steel, and can be replaced when worn. Two pieces of gaspipe are led from each toggle seat to the top of machine, by means of which they can be conveniently oiled. A large opening in each side frame allows the toggle-plate between pitman and swinging jaw to be removed and replaced when worn, without disturbing other parts.

The shaft which supports the swinging jaw is fast to the jaw and moves in the bearings on each side frame. This overcomes the pounding and jumping due to lost motion which soon appears when jaw moves upon the shaft, as the caps on bearings can be tightened whenever wear renders it necessary.

The fly-wheels are fastened with taper keys rounded to suit the surface of the shaft, so that in case of accident, such as a sledge falling into jaws, the belt can slip and rock-breaker stop while the wheels exhaust their motion, thus preventing serious injury being done to working parts. The rock-breakers can be entirely taken apart for transportation when desired.

The general form and design of this rock-breaker is such as to insure the greatest possible strength. All parts are carefully proportioned, the metal being placed where it will do the most good, and heavy tensile strains entirely taken by wrought iron.

Miners' Tools.

Mine managers, or those under them in immediate charge of the men on each shift, should always be careful that every workman is supplied with a sufficient quantity of proper tools in proper order. It is damaging to the owners to have a number of men underground without good implements with which to work. These should be kept always in good order and within reach of the place where the men are at work. In many mines this matter is not looked into as closely as it should be, and the consequence is that the men lose time and the work they do absorbs more vitality than it should. The more a mine manager looks after the comfort and wants of the workmen, the more will the men study the wants of the owner. Dall picks, etc., there is little excuse for; but even if there are a lot of sharp ones at the blacksmith shop, on the surface, that does the miner little good at the time. They ought to be furnished to him where he is at work, and spare ones should be ready at hand when wanted.

Mechanics and the Solar System.

We have received a little book from R. P. Traxler entitled "The Principles of Mechanics as Applied to the Solar System." The author has a number of illustrations in which he endeavors to show, by radiating lines, the manner in which the forces of the sun are applied to the planets, and the manner in which the forces of the sun and planets emanate from themselves. He gives also his ideas of the causes of magnetic currents, heat, ocean currents, earthquakes, etc., and the principle or cause of the tidal action. The author hopes that "the theories set forth will be carefully compared with all applicable natural phenomena and principles in mechanics with which the reader may be familiar, and that the claims advocated may be sustained only by the merits which they possess."

It has been the effort of the author to describe and illustrate the claims set forth in the book by principles that the general reader can readily understand and with which the common experiences of life familiarize us. The use of technical terms has been carefully avoided as much as possible, so that the reader, casual or otherwise, may be better able to reject or approve of the idea presented to the mind for consideration.

It has also been the aim of the author to represent as nearly as possible the operations of our planetary system within a space that will enable the mind to comprehend the movements of the planets and comets revolving around the sun, making the solar system appear as a simple and natural combined piece of mechanism, or a mere toy of the universe.

The table of contents indicates that the author has given consideration to asteroids, axial inclinations, comets, earth, earthquake, heat, Jupiter and his moons, Mars, mean distances, Mercury, the moon, moons of Uranus and Neptune, planetary formation and motion, moons and rings of Saturn, force and motions of the sun, the tides, Uranus and Venus. The book is one of 70 pages.

Further information of this work can be had by addressing the author, No. 240 Sutter St., S. F.

JOSHUA HENDY MACHINE WORKS,

(INCORPORATED SEPTEMBER 29, 1882)

Nos. 39 to 51 Fremont Street,

San Francisco, Cal.

Manufacturers of NEW and Dealers in SECOND-HAND BOILERS, ENGINES, PUMPS and MACHINERY
OF EVERY VARIETY.

"SENSIBLE" HORSE POWER HOISTING WHIMS.

These Hoisting Whims are built entirely of iron and steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready to work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

ROCK AND ORE CARS.

We Carry in Stock the Following Sizes, viz.:

NO. 1.--

Capacity with One Horse and Single Line, 800 Pounds, 75 Feet per Minute.

NO. 2.--

Capacity with One Horse and Single Line, 500 Pounds, 125 Feet per Minute.

Weight of Machine, 1200 Pounds. Total Shipping Weight, Including Sweep, Levers and Sheaves, 1400 Pounds.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

GIDEON FRISBEE, Manager, 59 & 61 First Street, San Francisco
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

ALBANY Lubricating Compound and Cups.

1868.

Manufacture commenced at Albany, New York.

1876.

Introduced by us on Pacific Coast.

1889.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER WHEEL MOTORS.

Varying from the fraction of 1 hp to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

All Complete for \$150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brakes sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "hoisted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

Mining Ditches.

In the mining districts of California, ditches are constructed holdly with steep grades and on irregular lines, with numerous sharp curves. The cross-sections, originally uniform, become more or less varied. Absorption, percolation, evaporation and leakage reduce the flow. Under such circumstances it is difficult to be mathematically correct as to amount of flow and discharge. There is no generally-accepted formula for determining the velocity of water in open channels. The tables based on the old formulas, published prior to the works of D'Arcy and Bazin in France, and of Humphreys and Abbot in the United States, being founded on data which ignore the important factor of the nature of the bed and the sides of the channel, have proved unsatisfactory. Hydraulic engineers have been compelled to rely for correctness of calculated result on the application of a combination of a few known laws with experimental data, which latter, though all-important, have been too restricted for the deduction of reliable mathematical theory.

In a paper, some time since, Mr. Ang. J. Bowls gave some of the results of experience in this State in the measurement and flow of water in ditches, describing the different miner's inches, and discussing the various coefficients in use in determining flow. From this we take a few sketches, showing sections of mining ditches.

The North Bloomfield main ditch is 40 miles long, with a sectional area of 23.89 square feet, and a grade of 16 feet to the mile. It has many abrupt turns and a sinuous course. The Texas Creek branch ditch is about seven-tenths of a mile long. Its sectional area is 13.5 feet and the grade 20 feet per mile. The sides are rough and curves sharp.

On the Milton line, from Milton to Enreka—a distance of 19.4 miles—the sectional area of the ditch is 20.39 square feet, grade 19.2 feet per mile for earth-work and 32 feet per mile for flume. The line is very irregular, having many drops and obuses. The distance from Milton to the measuring-box at Bloody Run is 29½ miles. The minimum established grade for the last ten miles was 16 feet per mile, with a sectional area for the ditch of 23.05 square feet. The La Grange main ditch, 17 miles long, has a sectional area of 22.5 feet and a slope of 7 feet per mile.

In all these canals, after the artificial banks are well consolidated, the water area is increased beyond the original excavation in the natural ground. Important losses must vary in every ditch, depending on the nature of the

VIEW IN THE GRANITE QUARRY, HALLOWELL, MAINE.

ground and the character of the construction of the work and the season of the year. The feeders along the lines compensate largely for these losses.

The following facts show the magnitude of the losses due to absorption, leakage, evaporation, etc.: Three thousand miners' inches of water (a flow of 75 cubic feet per second) turned in during the dry season at the head of the Bloomfield ditch, will deliver 2700 inches (67.5 cubic feet per second) at the gauge 40

miles distant. Twenty-four hundred inches of water (60 cubic feet per second) turned in at the head of the Milton ditch delivered formerly at the gauge, 29½ miles distant, 1450 to 1600 inches (36.25 to 40 cubic feet per second), but at present 2500 inches (62.5 cubic feet per second) turned into the head of the ditch, delivers 2000 inches (50 cubic feet per second) at the gauge.

The Enreka Lake ditch, with 2500 inches turned in at the head, delivers at the gauge,

33 miles distant, about 1800 inches in the dry season.

Granite Quarries.

As early as 1853 a granite quarry was opened in Sacramento county, in this State, and since then others have been systematically worked in Penryn and Rocklin, Placer county. The Penryn quarries were first opened in 1864. The rock varies in color from light to dark gray, one variety, which contains both hornblende and biotite, being almost black on a polished surface. They are, as a rule, fine-grained and take a good polish. Blocks more than 100 feet long, 50 feet wide and 10 feet thick, have been quarried out and afterward broken up.

A fine-grained light granite is found on the line of the S. P. R. R., between Los Angeles and Cucamonga. Its texture is as fine as the finest Westerly, R. I., or Manchester, Va., stone, and of a uniform light-gray color. A coarser stone is also found at Sawpit canyon, in the same county.

We give herewith a view of the famous granite quarry at Hallowell, Me., where the rock is celebrated for its heavy and fine working qualities, and is in demand for statuary and monumental work. The rock is properly a gneiss, but showing no signs of stratification in the hand specimen, is classed as a granite. As illustrative of the great extent of the quarries shown in the cut, it is stated that blocks 200 feet in length, by 40 feet in width and 8 feet in thickness, can be broken out in a single piece if so desired. There is no gap between the sheets, and little or no pyrite to cause discoloration. The sheets, as is usually the case, increase in thickness downward, being about one foot thick at the surface and ten feet thick at the bottom of the present openings, which are from 50 to 60 feet deep.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

The Mines of Rocky Bar, Idaho.

EDITORS PRESS:—The mineral resources of Idaho, both in placer and quartz, are about to astonish the world. Heretofore surface prospecting has been the rule; during the last two years, however, more thorough work has been done, and in many districts with most gratifying results. It is not the intention of the writer to devote much time to the description of old mining properties in the vicinity of Rocky Bar, the history of which is so well known, but rather to call attention to some of the more newly discovered bonanzas.

The Ophir mine, owned and operated by the Comfort Consolidated Mining Co. of New York, is situated immediately north of the old Hardscrabble placer mines, and about two miles northeasterly from the town of Rocky Bar. This lode had been located and relocated by different parties who were without the necessary means to develop the property, and, although well satisfied that millions were there, they were forced by circumstances to abandon the claim; hence the Comfort Con. Mining Co. have the honor of developing the first billion-producer on the Ophir belt, simply because they were the first and only parties that were able to couple good judgment with the requisite capital. Fortune has smiled upon them, and the outlay of a few thousand dollars has rewarded them with a well-defined vein of ore six feet in width, milling from \$75 to \$100 per ton. A fair estimate of the value of ore now in sight would not be less than \$1,500,000.

Let fall this company was so well satisfied with the developments made by their superintendent, Steve Oglesby, that they resolved to erect a mill, although winter was staring them in the face. The result is that, after encountering numerous difficulties, they have, through the energy and zeal of that indefatigable mill-builder, Col. John M. Thexton, been able to realize their fondest hopes; and to-day, and for the past three weeks, an improved Frazer & Chalmers 20 stamp mill, with a large double-drum hoisting plant, two Golden Gate concentrators and a three-compartment working shaft, are in operation, all the machinery moving with the precision and correctness of planetary revolution. I must say that the Comfort Co. are to be congratulated for the energy they have displayed and the success they have achieved in Rocky Bar.

The Empire lode, situated north of, parallel with and adjacent to the Ophir, gives every promise of becoming equally as valuable as its renowned neighbor.

Placer Claims.

Last fall while on a prospecting tour in Central Idaho the writer had the pleasure of meeting Major Comfort at Salmon Meadows. The major, together with Superintendent Oglesby and Surveyor Towne, were on their way to survey some placer locations at the northeastern end of Long Valley on Boulder creek, Boise county. These placers were worked by Oglesby as early as 1868, ditches built, and water brought upon them, but the Indians becoming troublesome, he was forced to leave. They have lately been relocated and sold to the Comfort Co. After a thorough examination, the owners are so well pleased with their bargain that they intend to construct the necessary flumes, ditches and hydraulic machinery to successfully work their ground this coming spring. They have 20 locations with an area of 400 acres, and I believe that they will meet with as good success there as they have at Rocky Bar with their lode mining property.

Hydraulic Elevators.

The reason why these placers have not been more extensively worked before this is this: the ground does not afford sufficient fall for a dump, and although known to be rich, the old-fashioned placer miner had no means of obtaining this defect. This company has secured a large volume of water, with ample pressure from the numerous water-courses and lakes in the mountains northeasterly from their ground and intend to work with hydraulic elevators, thus raising the gravel to any desired height, and in this way securing a sufficient dump for their tailings. This process necessitates the outlay of considerable capital, but close calculation has demonstrated the fact that the returns will pay a handsome interest on the investment.

While prospecting in the mountains at

The Head of Boulder Lake,

The headwaters of Boulder creek, about ten miles from the above-described placers, your correspondent, together with John Knox and others, discovered a well-defined and valuable mineral belt, which we traced through the mountains for a distance of 12,000 feet. The average width of this lode is about five feet. Along the footwall for about 15 inches, the ore assays \$33.15 gold and \$12.25 silver; the balance of the lode is strongly impregnated with silver chloride, assaying 101 ounces of silver per ton. The surrounding country is heavily timbered with fir, pine and tamarack, as yet untouched by the woodman's ax; water and grass, with game of all kinds, abound here, in fact this country is the hunter's paradise and the prospector's realization.

Your correspondent, while returning from the

mountains, again met the surveyor and his party with theodolite, chain and staff, surveying and marking the boundaries of the rich placer bonanzas, while Major Comfort, with a force of workmen, had sunk about 30 shafts to bedrock, and was filling as many different sacks with the golden gravel for shipment to New York. This gravel, I am informed, yielded far greater results than was expected, and demonstrated beyond a doubt the remarkable richness of this property. When it is considered that this ground is about midway between two of the richest placer-fields ever discovered in Idaho, namely, Florence and Warren's on the north and the Boise basin on the south, the results obtained from the gravel tested are not at all surprising.

Referring again to mines near Rocky Bar, I will call attention to a mountain range in which

Many Rich Prospects

Have been discovered, and which contains within its depths the famous Mountain Goat, so successfully worked by Major Frank P. Cavanaugh.

As you ascend this mountain from the south, at a point about 1000 feet north of the town of Rocky Bar, you will find the Birdie Q. mine, which has been worked quite extensively during the last two years by Messrs. Van Schaick & Quitzw, the owners. They have sunk an incline on this lode to the depth of 75 feet, and made connection with the same by means of a tunnel 150 feet long, driven from the east. The quartz taken from this incline and tunnel milled \$25 per ton. This lode is three feet wide, and can be traced on the surface the whole length of the claim.

West of the above lode and adjoining the same is the Mountain Chief lode, the croppings of which are from one to six feet in width, and prospects well in free gold. Aside from the annual assessment work required by law, little has been done on this claim. There is, however, no doubt but that with a judicious outlay of a moderate amount of capital, a mine could be opened second in value to none in the camp. This location is also owned by Van Schaick & Quitzw.

Northerly and farther up the mountain is the Duncan mine. This lode has been out through by a tunnel and drifted upon by cross-roads from the same, showing a good lode, but very irregular and uncertain, demonstrating the fact that this work has been done too near the surface. Were the owners of this mine to sink upon the lode at some point where it is exposed in the tunnel, they would undoubtedly be rewarded for their trouble and expense.

The Idaho Consolidated

Gold & Silver Mining Co. of New York are the owners of the North Pacific, Almaden, Golden Osl, Golconda and San Jose, five patented claims lying between the Duncan on the south and the Ophir on the north. Quite an amount of money has been expended by this company to place this property in a condition to warrant the erection of a mill, but unfortunately the tunnel which was so nicely and thoroughly constructed was driven in the wrong direction for a distance of between 700 and 800 feet, every foot of which was carrying them farther from the ledge. Under these circumstances it is not surprising that discouragement and consequent stoppage of work followed. In conversation with U. S. Mineral Surveyor Towne, who is thoroughly familiar with every lode and claim in this section of the country, he informed me that the mistake made by the Idaho Consolidated arose from the fact that croppings of several ledges had been considered by the person in charge as the outcrop at different points of one and the same ledge, thus misleading him as to the proper course of the lode and the consequent direction in which to drive the tunnel. I believe that the Golconda or San Jose can be made as valuable as either the Ophir or Mountain Goat, and that a few thousand dollars properly expended will effect this result.

West of and adjoining the Comfort Con. Co.'s property is

A Group of Six Quartz Locations,

Owned by Cochrane, Fitzgerald & Co. A continuous body of ore can be readily traced upon the surface direct from the Ophir workings to the extreme western boundaries of these claims; it is, in fact, upon the Yankee, Jim Blaine and Josie locations that the celebrated Ophir lode appears to have reached its grandest proportions, for a mountain of quartz is here exposed to view for a distance of 3000 feet, any of which will mill from \$10 to \$15 in free gold, while samples selected from certain portions of the ledge have assayed over \$300 per ton; without exaggeration, we freely state that this property offers, in our opinion, a more safe and profitable investment for capital than any mining project that the writer has examined for many years.

West of Rocky Bar

And adjoining the eastern end-lines of the old reliable Elmore, Confederate Star and Objective claims are locations worthy the consideration of any syndicate seeking investment in mines. The Esmeralda is the eastern extension of one of the ledges in the Confederate Star claim, as has been thoroughly demonstrated by the Elmore Company in sinking their new shaft, which is located at the common end-line of the two claims. The vein is from three to nine feet in width, and the last run of ore milled \$45 per ton, some of the rock assaying over \$400 per ton. The owners, Messrs. Geo. Winder & Co., are expecting daily to make a sale to

parties well able to work the mine to the best possible advantage.

Running parallel with the Esmeralda and east of the Ida Elmore is the Surprise lode claim. The general course of the Elmore vein as indicated by the underground workings will necessarily lead this lode through the Surprise ground, near the eastern boundary of which very heavy croppings exist, similar in character to those of the Elmore. At this end of the claim a tunnel is being driven that will tap the lode at a depth of 400 feet. This claim belongs to Thompson, Tonkins & Quitzw.

South of the above described claim and east of the Objective is located the Great Republic, which, together with the Wedge location lying south and west, contain within their boundaries the apex of the Alturas lode. That this assertion is well founded will not be questioned by any mining expert upon an examination of the ground.

There is no doubt but that this group of mines, extending from the Tiptop on the south to the Viehnn on the north, completely cut off the Alturas, Elmore and South Confederate Star lodes at their common end lines, running thence easterly from the Elmore Co.'s works. It would be of great benefit to the camp were this property secured by some company having the energy and capital to properly develop the same, the ground being in all respects similar to the Elmore, and possesses the additional advantage of having its rich bodies of ore near the surface still in all their virgin purity, ready to repeat the history of the Elmore as a gold-ore-dancer.

AUG. QUITZW, M. E.
Rocky Bar, Idaho.

River-Bank Cutting—Its Causes and Prevention.

EDITORS PRESS:—A correspondent of your paper, writing from Ventura, calls attention to the increase in damage to valley and bottom-lands by the streams of Ventura county, and especially by the Santa Clara river. This is true not only of all our streams recognized as such, but of new torrent-temporary channels forming through the southern country. It is also increasingly true with each year. This change of stream action may be said, in a general way, to have commenced within 20 years. It has been rapid during the past ten.

Many years ago I called the attention of the Department of the Interior at Washington and the president of the Southern Pacific Railroad Company at San Francisco to the commencement of this torrential action. It was pointed out that fires were being set on the mountain watersheds of our streams, destroying large amounts of brush and timber; that extensive hill districts were overpastured, especially by sheep, and that the axman was not idle in the mountains. All these things, it was said, could only have one result, judging from the recorded experience of Europe, viz., increased torrential action and eventually decreased permanent water. To prevent further injury to land, and consequently to the tax-paying and freight-producing capacity of the country, and to the railroad road-bed, especially in the Soledad canyon (Santa Clara river), it was urged that a forest policy should be adopted looking to the proper management of the mountain watersheds of the country.

I do not cite these letters as a case of "I told you so," but to show that long ago the conditions were perceived that would, if continued, do the damage now complained of. In the first report of the State Board of Forestry I went over this ground again and brought up a number of cases of the recent creation of new and dangerous torrents in California. Among other instances from Europe, I called attention to the complete ruin of 200,000 acres of good farming land in the valley of the Durance, in France, following the outting and destruction of the forests on its mountain watershed, accompanied by overpasturing by sheep.

Nothing serious has been done in all these years to prevent their destruction—in fact the Federal Government owning the lands is the only source of remedy, unless, indeed, the State should apply to buy all these forest lands for the purpose of preserving not only them but a large portion of its tax-paying lands also.

The question from Ventura is, "What is the remedy now?" For the lands out away, for the gullies and barrancas formed, for the swales cut out, for the lands covered with sand and stones, there is none. These are ruined forever, but for the lands still safe?

First of all is the old one, an intelligent forestry system with intelligent men at its head, and all the mountain, forest and brush land under their control, whether public or private.

But now that our Southern watersheds, with an equal rainfall, deliver so much greater volumes of water for short periods than formerly, we may well look into some suggestions to limit as far as possible the damaging effects of this action.

In the first place we must recognize several facts before we can go into the subject intelligently. One is that the same volume of water in our streams now has more erosive or cutting force than formerly. The reason of this is that our streams are now more heavily charged with sand and other detritus than formerly, and they consequently act upon everything with which they come in contact like a sand blast does on glass. Take the sand out of the air and the glass is not cut; take the sand out of

your river water, and while it will still cut it will not do so to anything like the same extent as with the sand. I have made a personal and experimental study of the erosive power of water with and without sand, and know that the above statement is true. The reasons why the streams carry more sand and detritus than formerly are threefold.

1st. The forest and brush destruction in the mountains. This covering removed from a steep watershed, every rain will carry down more of the mountain soil, sand and stones into the water channels than before. We have here two plain effects; more water is delivered with a given rainfall from a given watershed within a given time than before the forest destruction, and the volume of the water so delivered must be increased by the volume of the detritus it carries. This addition of flood height by what the water contains is considerable. Any one can obtain some idea of it by taking a bottle of turbid flood water and noting the sediment formed after standing.

The more detritus a stream carries, so proportionately greater is its tendency to change its channel. Thus a muddy stream is continually throwing itself now against one bank and now against the other. This is not the case with clear streams.

2d. Over-sheep-pasturing whereby the herbage which detains the water and holds by its roots the soil, is too closely removed. I have never observed a gully commence to cut on well-grassed land no matter how steep. On the other hand, one often sees out sand washes entirely arrested when coming from bare to grassed lands.

3d. Cultivation. As this is always on more or less level land, it plays a smaller part than it otherwise would.

The first two causes can be entirely eliminated, the third cannot. But while we are attending to these causes, or rather not attending to them, the river cut and the outlook is for the entire destruction of the bottom-lands. Your Ventura correspondent suggests wiogdams made by driving piles throughout the cultivated course of the Santa Clara. Such a system would be very costly both for construction and maintenance, and besides would be of very little service unless made by engineers specially skilled in river work. My own experience of preventing the erosion by rivers of their banks is limited. As far as it goes, however, it has been a success. In my case, a ditch about three feet deep was dug in the stream-bed along the whole length of the exposed bank; into this was placed brush, the whole line thickly set with willow cuttings and the brush wired together and to posts or fixed objects at various points. This has stood the brunt of all the waters since October, while the same stream has cut away its banks and carried away bottom-lands in my neighborhood. The idea for the future is that when the brush decays and the wire rusts, the willows will have grown and formed a permanent protection. Certainly a thick mass of willows will resist a great deal of water. When the water in a stream is constant or near the surface, the willow will be the cheapest to plant, the surest to grow and the best protection.

Where, however, the water is not constant, I would suggest the brush-wired hedge with poplars, cottonwoods or *Eucalyptus viminalis* planted closely in or by the side of the hedge. The *E. viminalis* would probably be best in the end, though not so cheap to set out. Take precaution not to let the stream get behind the head of the hedge.

So much damage has been done lately by water erosion to lands, and so much more is to be anticipated unless measures are taken to prevent it, that the subject is one of very great importance.

ABBOT KINNEY.

Lamanda Park Los Angeles Cal.

Balls of Fire.

EDITORS PRESS:—Your article in the PRESS of February 8th, page 96, headed "Strange Phenomenon," as observed in Texas on a railroad train, also in New England in 1834, reminds me of an occurrence of the same nature in Belfast, Maine, about the year 1844.

I was walking across the long bridge over an arm of the bay, and my attention was attracted by an immense ball of fire of about the color of an electric light shooting through the air in a horizontal line, with great velocity, and leaving a trail behind of the same color described in the articles referred to above. This trail floated in the air until the two ends met and formed a complete circle fully as large as the half-circle spoken of, and lasted while I was walking over a mile. It was plainly visible, though somewhat faded, when I went into the house. This was near midnight, clear and starlight.

Might not such a shooting ball of fire have caused the phenomena referred to, the fire having exhausted itself before discovered?

Oakland, Cal.

A SUBSCRIBER.

LOCOMOTIVE FIRING.—By a new device invented by James Resgen, the inventor recently ran a Pennsylvania railroad locomotive between Harrisburg and Philadelphia continuously for one week without changing the fire in the furnace, and nothing of the kind has ever been attempted or accomplished before. The invention will revolutionize the old-time methods used in firing locomotives if the railroad companies adopt it.

Californians on the Atlantic.

EDITORS PRESS:—On Sept. 4th, at about 5 P. M., four steamers—City of New York, City of Rome, Tentonic and Ohio—left the Mercey river in front of Liverpool for the United States, carrying not less probably than 4000 passengers.

The steamers anchor in the stream and steam launches transport passengers and freight to them. To remain on the floating dock and see the passengers as they come down with their baggage to go on board the launch is an interesting and instructive sight. The steerage and second class are taken on board in the forenoon and cabin passengers last. The steerage passengers furnish their cups, dishes, wash-basins (tin), and mattress and blankets, I presume, if they have any. Here you have all kinds of models of trunks from the latest style to the rudest in construction and most aged.

Printed tickets are furnished the passengers of two kinds, and are pasted on the end of the trunk, stating whether wanted in stateroom or to be put down in the ship's hold. The trunks are hoisted on board by steam-power by putting a sling around eight or ten, according to size, and are handled pretty roughly. I saw several of them that will never be able to make another tour without a good deal of nursing.

It was foggy all the way over to Queenstown, and we had not got out of the harbor before the fog-whistle was sounding, and kept up nearly the whole time. We arrived at Queenstown about 9 o'clock A. M., two hours behind time. We did not go into the harbor, but two steam launches came out with passengers and their luggage, which took about one hour to transfer to our steamer. Some passengers and trading people came out in three row-boats.

The deck of our steamer must be nearly 25 feet from the water, and these passengers were pulled up by sitting in a howline at the end of a rope. They held on to the rope with their hands above their heads, and as they were being pulled up, they walked up the side of the ship, which worked very nicely with those that were used to it. The women came on board and sold apples, pears and nectarines. The men sold canes, bracelets, pipes and images cut and carved from the black oak of Ireland.

I cannot say we have had particularly rough weather, but it has been windy, cold and rainy, and about half of the passengers have been more or less sick.

We pass a large steamer nearly every day, and sailing vessels are in sight most of the time.

The most satisfactory thing we have seen on this trip was two icebergs to-day about 11 o'clock. When we first sighted them, I did not dare to look over the vessel for awhile, for I thought it was a hoax, as the officers said it was too late in the season to expect any. At a long distance they looked like the white sails of a vessel. The captain ran the steamer between the two, which were perhaps three miles apart. The one on the starboard or north side was as white as snow, and in fact appeared to be covered with snow, except one steep side, which showed the solid crystallized ice. It was something like a hundred feet high and covered perhaps nearly an acre of space. The top was shaped like a peaked mountain.

The one on the larboard or south side was much the larger and higher and darker, and looked as though composed of strata of alternate snow, ice and earth. I should think this one covered something more than an acre and was more smooth on its top. I think this was over 100 feet high. The wind and the gulf stream were drifting them to the southward. Smaller pieces could be seen drifting away from the larger. It was an interesting sight to see these frozen monarchs drifting so majestically and silently to their southern doom.

The air seemed to be uncommonly cold this morning and all the passengers could imagine they could feel the wind from these floating icebergs. I took my field glasses and peered at them on every side that presented itself to me, and there was only one thing that I could not see to make them natural and perfect, and that was that the painter had not got there yet with his paint-pot, and there is one fair spot on the face of the earth that is not marred by the ever present "Pearse" soap or "St. Jacob's oil."

On shipboard one has one of the grandest opportunities to study and portray human nature. If I had a facile pen I think I could easily get up something that would be hitting a "yaller kiver" hook or be handy to kindle a fire. We have something like a thousand souls on board, and it seems like a village; still there is plenty of room on this large, fine ship. We have the lights and shadows, beauty and comeliness, age and youth, position and ambition, modesty and affectation, piping and squealing of the pretensions that have been abroad. We have the doting mother who has been abroad with her darling daughters looking out for a future market for our surplus. I heard her say something about selling American girls to foreigners. I hope and expect she will make her report on the condition and price in the market.

A good many have the folding extension chair, which they stretch across the deck and lounge in them, utterly regardless of the convenience or opportunity of others to promenade.

It is amusing to hear some of the ladies who have been in Paris criticise the artists in Paris

and the pictures on exhibition. In one case, one edified the passengers at the table by stating some celebrated artist could not paint a hand so that it could be told from a dalmatian or an angel. I will not take up time by repeating any more of her learned disquisition on the arts. When the rolling of the vessel did not nauseate me, she did by compelling me to listen to her superficial attempt at showing her ignorance.

In the evening a discussion took place on the protective tariff. No particular new points were developed except the practical experience obtained while the debaters were in Europe this time. I think the affirmative side got the best of the argument, as it usually does.

On the evening of the 10th there was a concert in the cabin for the benefit of the seamen's orphans of Liverpool.

There are on board 48 representative American workmen called the "Scripps League," that are on their return from Europe, where they have been to investigate all branches of industry, agricultural, educational and professional. They embrace skilled persons in the several departments.

Scripps publishes four afternoon dailies, in Cincinnati, Cleveland, St. Louis and Detroit.

Henry M. Stanley.

The name of Stanley is a proud one in English history. And when his name is mentioned to-day, all minds turn to him to whom God has, through strange leadings, assigned so prominent a part in the deliverance of Africa from its thralldom.

It is now well known that his original name was John Rowlands, and that his parents had so little means that he was sent when three years old to the poor-house at St. Asaph to be brought up, whence at the age of 13 he was turned loose on the world to shift for himself. He was born near Denbigh, Wales, in 1840, the very year that Livingstone, aged 23, first entered Africa as a missionary. When about 14, he found his way to New Orleans from Liverpool as cabin boy of a sailing vessel, and there a kind merchant named Stanley, little knowing what he did, adopted him. But Mr. Stanley died before Henry came of age,

HENRY M. STANLEY, THE AFRICAN EXPLORER.

Scripps pays nearly all expenses, which will cost about \$20,000, and each department is to give a full and intelligent report of their observations, to be published in his papers. Among the party are four editors and four ladies. One of the ladies, Widow Barry, represents the cotton department. She holds an official and exalted office under Mr. Powderly in the Knights of Labor. She is called a public agitator speaker. She is a good deal on the Kearney order—more noise than education. I was introduced to her as from Sacramento, and a person who employs a good many Chinese. Before the echoes of the introduction had fairly died away, she sent a wave of indignation after the poor Chinese that would have swept them back to the flowery kingdom with one blast of her trumpet if I had not implored her to let them stay until they had picked one more crop of hope for me. I would like to see the reports of some of these commissioners in the rough; I think they would show a more intimate relation with tools than letters.

The 12th was rainy and foggy all day, and with a good deal of rough sea. We only experienced one day of the terrible storm they had about New York. We came to anchor about six o'clock in the stream, Thursday, the 12th, eight days from Liverpool. D. FLINT.

[This letter closes the series to the preparation of which Mr. Flint must have given much of his leisure time. Few men could find opportunity to write so much during a hurried tour, and few could make such a delightful combination of fact and fancy as he has done. He has shared with his California friends the advantages of his opportunities and they will thank him heartily for his instruction and entertainment.—EDS. PRESS.]

leaving no will, and the lad was again thrown on his own resources.

On the breaking out of the rebellion in the United States in 1861, young Stanley went into the Confederate army. He was taken prisoner by the Federal forces, and, being allowed his liberty, he volunteered in the Federal navy, being already fond of sea-faring and adventure. In course of time he was promoted to be acting ensign on the ironclad Ticonderoga. When the war was over, his love of adventure led him to travel, and he went to Asia Minor, saw many strange countries, wrote letters to the American newspapers, and even then was making for himself a name and fame. Returning to the United States he was sent by Mr. Bennett, of the New York Herald, to Abyssinia in 1868, a war having broken out between the British and the king of that country. There, Stanley got his first taste of African adventure.

In the autumn of 1869, the world was beginning to wonder whether Dr. Livingstone, the devoted Christian missionary and African explorer, was alive or dead. More than 20 months had passed since his last letter was written, and the world began to believe he had died in the heart of the Dark Continent. James Gordon Bennett, the editor of the New York Herald, was at this time in Paris, and telegraphed Stanley to meet him there, which, with his customary promptitude, he immediately did. On his arrival, he was confronted with the startling and wholly unexpected question, "Will you go to Africa and find Livingstone?" After a moment's reflection he answered "I will," and the agreement was at once concluded.

The 21st of March, 1871, found Stanley at Zanzibar, with a caravan of 192 followers, ready for the great expedition. On the 24th of October, at Ujiji, on the shores of Lake Tanganyika, he first met the famous missionary who was so powerful to influence all of his after life. They remained together till March 14, 1872, the younger man drinking in the spirit of the elder, and becoming, as he often declares, converted by him.

Two years later, in the spring of 1874, when the remains of Livingstone were carried back to England in one of the Queen's ships, for burial in Westminster Abbey, Stanley was one of those who bore him to his grave. It was then, he tells us, that he vowed he would clear up the mystery of the Dark Continent, find the real course of the great river, or, if God should so will, be the next martyr to the cause of geographical science.

The outlet of Lake Tanganyika was as yet undiscovered; the secret sources of the Nile were unknown, and even the then famous Victoria Nyanza was only imperfectly sketched on the maps.

The proprietor of the London Telegraph cabled Bennett, asking if he would join the new expedition. "Yes, Bennett," was the answer speedily flashed back under the sea, and the thing was determined. Stanley left England in August, 1874, attended by only three white men, and at Zanzibar the party was increased by porters and others, mostly Arabs and blacks, to the number of 224 persons, some of the men taking their wives with them; and on the 13th of November the column boldly advanced into the heart of the Dark Continent, having for its twofold object to explore the great Nile lakes, and, striking the great Luabala where Livingstone left it, to follow wherever it might lead. It has been rightly called "an undertaking which, for grandeur of conception, and for sagacity, vigor, and completeness of execution, must ever rank among the marches of the greatest generals and the triumphs of the greatest discoverers of history." August 9, 1877, Stanley emerged at the Congo's mouth, and "a new world had been discovered by a new Columbus in a canoe."

On his return to England he found an embassy from the King of the Belgians, who had been planning an expedition to open up the Congo country to trade, and who wanted Stanley to take command. With great reluctance he undertook the management of the International Association, as the new organization was called, and returned to Africa in 1879, where he remained nearly six years, hard at work, doing more than any other man to found the Congo Free State south of the great bend of the Congo river, having an area of 1,508,000 square miles, and a population of probably fifty millions. In obtaining the concessions of over 400 native chiefs, not one shot was fired. It was a grand victory over barbarism without the guilt of bloodshed that too often has stained such triumphs.

While Stanley was in this country, during the winter of 1886-7, he was called back to Europe once more to take command of an African expedition, the one for the rescue of Emin Pasha. June 28th, with a total force of 389, Stanley started eastward from a point not far from the mouth of the Aruwihmi. Progress was slow, owing to opposition of the natives and sufferings of the party as they marched through thick and gloomy forests. When they reached Ibwiri, 126 miles from the Albert Nyanza, Nov. 12th, the party had become reduced to 174, and most of those that survived were mere skeletons. After resting 12 days they resumed the march and in another week emerged from the deadly forest. Dec. 13th they sighted the Nyanza and encamped on its banks, but Emin was not there. They were too weak to march northward to Wadelai, the capital; the natives would not let them have a boat and Stanley would not take one by force; there were no trees large enough to make one, and his own boat was 190 miles in the rear because the men were too weak to bring it. There was nothing to do but to go back for the boat. In spite of Stanley's severe illness, which required a month's careful nursing, what was left of the force was back in the vicinity of the lake by the last of April. They found a note from Emin, who had heard rumors of their arrival and begged them to stay till he could communicate with them. Emin arrived in his steamer April 29th amid great rejoicing. The two parties remained together until May 23d, when Stanley, rested and reinforced, started back to Fort Bodo, where he had left men and supplies. He pushed still farther back, hoping to meet the other half of the expedition. But Major Bartelott had been shot and the demoralized rear column had gone to pieces, believing the report that Stanley was dead. Though disappointed and crippled, Stanley went back by a shorter route to the Nyanza and again united with Emin.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

FINISHED.—Amador Dispatch, Feb. 15: The tramway at the Amador mine has been finished and the mill will be started as soon as their concentrators can be got up from Ione. The roads have been so bad for the last two or three months that no heavy machinery could be hauled up, but they are improving rapidly now.

MIDDLE BAR.—Middle Bar, which has for a long time been very dull, is having some sort of awakening, due to the work being done on the Hardenburg. The hoisting works are being erected. Mr. Matson is directing the work, and it will be finished in about two weeks. D. Donnelly of Sutter furnishes the machinery and C. O. Mitchell the pipe. The work being done gives employment to quite a number of men.

KEYSTONE.—Ledger, Feb. 15: A new strike, which is believed to be pregnant with future prosperity for this, the oldest bullion-producer of the county, was made last week. Men have been employed in prospecting operations at the 1400-foot level. For 400 feet above that level the ore body was lost, and extensive prospecting failed to reveal its existence. The unwelcome conviction began to force itself upon the minds of many that the mine was worked out, that the pay chute of this famous mine did not reach down into the earth beyond 1000 feet. This idea has been exploded. In cross-cutting west, a distinct ledge, said to be 16 feet wide, has been encountered. We are informed there is no doubt of its paying nature. The length of the vein is not known, but drifts will be run north and south as speedily as possible to determine this point. The discovery, it is generally believed, will give another long period of prosperity to this grand gold-producer.

AMADOR GOLD MINE.—The concentrators and other machinery necessary to the completion of the mill are now arriving, and the work of putting them in position is to be pushed ahead as rapidly as possible. Ex-Senator Wallace of Pennsylvania, and Mr. Harrison from London, who is largely interested in the property, arrived here last Saturday, and it is understood they intend to remain here until the mill is completed. This will take at least a month, providing we have favorable weather to admit of the hauling of the 50 tons of freight from Ione. The number of working hours with some of the miners was increased from eight to ten. This action is not unusual. In those places where the ventilation is not good, eight-hour shifts are in vogue; where the air is better, ten hours are required. Some dissatisfaction was felt on account of pay-day (the 12th instant) passing, and the workmen failing to get their money. They are now two months behind. This, however, while it is hard on those who depend entirely upon their monthly wages for the payment of their bills, should cause no serious anxiety. The vast improvements at the mine and mill—undoubtedly not surpassed if equaled in the State—are a sufficient guarantee for the payment of a few thousand dollars arrearage for wages.

NEW LONDON.—Thirty stamps of the New London mill were started on Tuesday, and will be kept running steadily.

MISCELLANEOUS.—At the Casco or Hardenburg mine at Middle Bar, they are engaged in putting up a water-power hoist. They have 400 feet of water to take out of the shaft, and it is the intention as soon as this is accomplished to sink the shaft several hundred feet deeper. At the North Gower they have secured a lot of pipe from the Treasure Box mine, and a water-wheel used at the Potosi, and will put up water-power hoisting works as speedily as possible. The Grass Valley hydraulic is running steadily with an abundance of water.

Calaveras.

WEST POINT.—Calaveras Chronicle, Feb. 15: Mr. Moore has a large force of hands engaged in moving the machinery from the Water Lily mine to the Blazing Star. It is expected that everything will be ready to start up in about two weeks. The Lone Star mill is doing good work. Mr. G. L. Brown, the superintendent, has just returned from San Francisco and will, it is expected, make quite a number of hearts glad. The Lone Star is not the only mine in the district. I know of several good mines owned by prospectors who have not the means to handle their properties when they reach water-level, which they do at a depth of from 75 to 100 feet. It is safe to assert that there are hundreds of California and Eastern capitalists who, if they only knew the chances this district affords them to get hold of a good mining property, there would not be many left in a year's time. The mines in this district have just been prospected enough to prove conclusively that this is no pocket mining, but legitimate and well-defined ledges with rock bearing gold and silver and assaying up in the hundreds. With such mines as the Lockwood, that has produced thousands of dollars, the Lone Star and Blazing Star, which have as fine-looking ledges as can be found anywhere in this State, ought to be proof enough for men looking for mines to see for themselves. We also have some rich gravel deposits in this district which have scarcely been prospected as yet, although the water facilities are abundant. All that is needed is capital to develop some rich placer mines. Operations will be resumed at the Tom Payne and Scorpion mines in a few days. Messrs. Gilgore & Kizer have been taking out some very rich rock from their mine which lies southwest of the Blazing Star.

DRY CRUSHING.—Angels Echo, Feb. 13: Otto Dolling will have eight tons of quartz crushed in C. D. Smyth's dry crusher, situated near Angels, next week. In connection with the crusher, Mr. Smyth has a process of his own for the treatment of refractory ores.

CLOUD.—Work is progressing on the Cloud mine near Albany Flat, owned by Mr. Otto Dolling. A perpendicular shaft is being sunk alongside of the ledge, and it is the intention of Mr. Dolling to run a crosscut and tap the vein as soon as the shaft reaches a satisfactory depth.

El Dorado.

TO BE DEVELOPED.—Cor. Placerville Observer, Feb. 18: W. B. McKinney came up from the Capli-

tal City on Tuesday, and from what can be learned, he and his partner have sold or bonded their portion of the old Stuckslager quartz mine, south of Lotus. It is now in the hands of a Sacramento company, who intend, as soon as the weather will permit, to erect machinery for developing the claim. This mine has heretofore been worked on rather a poor plan, and we are certain that if the new company are in earnest, put up machinery and work the mine as it should be worked, they are sure to realize handsomely from the property, besides helping to build up the town and make things more lively. We hear that a claim has been bought by the Chinamen, in Coloma, the price paid being \$1200. It is a placer mine, and will be worked in that style.

Inyo.

TRAIL TO SALINE.—Index, Feb. 12: Following the Index suggestion of last week regarding a short and practical route from Independence station to the Saline Valley borax-fields, it is claimed that an easy route for a pack-trail can be found between the points named, and that the distance will be but little, if any, in excess of 20 miles. The route is now being gone over by a practical man, with a view to contracting for the transportation of borax by pack-train at a much less figure than the present cost of hauling.

QUARTZ.—Inyo Independent, Feb. 14: A couple of young men who came to Big Pine recently from Kern county went prospecting in the foothills west from Big Pine. They struck a ledge of quartz, and from 300 pounds of the ore took out \$150. No report is given as to how big the ledge is.

CERRO GORDO.—The work of retimbering the Union shaft at Cerro Gordo is nearly completed. When this job shall be finished it is very likely that the force of miners will be largely increased and the work of developing the mine be pushed vigorously. In the meantime good ore is being taken out of the mine right along, and a 12-horse team is kept steadily on the road hauling the ore to Keeler.

BORAX.—Mr. J. H. Roberts says the activity in borax continues as lively as ever in Saline valley, and he is confident a great deal will be done there during the coming summer.

Kern.

AGUA CALIENTE.—Cor. Kern County Californian, Feb. 15: Agua Caliente is situated about six miles in a southeasterly direction (latitude and longitude unknown to me at least) from Walker's Basin, with Mrs. Scobie's ranch as the central point. It is generally supposed to be a stock-raising country, which it certainly is, and stock of all kinds is looking well. But as a mining country it is slowly but surely coming to the front. Messrs. McKay and Stuter are working four men on the Juan Doisa mine, and are down 150 feet with the ledge improving every foot in depth, the ledge being from two to four feet in width at present. Hugh Mann has retired to his ranch to recruit after a hard and profitable summer's work on the Mace and Janett mines on the south side of Piute Mountain. Mr. Sower and Mr. Blank are running a tunnel on the Brogan mine about two miles from Scobie's ranch. They are in a distance of 100 feet, with very encouraging prospects. Mr. Berry has located the Little Joker near E. R. Peek's ranch, and has started a tunnel. He has found some good prospects. Mr. Ahern has returned to Kern with three partners, all expert miners from Arizona. They have located what is known as the Herbert mine, about three miles northeast from the Indian Rancheria, and have run a tunnel into the ledge which is looking well. They have also found a new ledge with a continuous pay chute on the surface for a distance of 400 feet. They have sunk a shaft 150 feet. Messrs. Miller & Cauty have relocated the old Helmes' mines from which a considerable amount of good ore has been taken in the past, and in which there is good reason to believe plenty more exists.

Napa.

QUICKSILVER SHIPMENTS.—Calistogan, Feb. 12: During the month of January, flasks of quicksilver produced at the mines were shipped from Calistoga as follows: Napa Consolidated, 215; Bradford mine, 125; Great Western, 55; Sulphur Bank, 90; total flasks for month, 485.

Nevada.

THE HOMEWARD BOUND MINE.—Tidings, Feb. 15: We are informed by Mr. J. M. Lakeman that he has received a cablegram from a syndicate having a bond on the Homeward Bound mine, Allison Ranch, to the effect that the purchase will be made. The bond expires March 1st. The Homeward Bound is situated this side of the Hartery, and is separated from the Omaha by the Illinois ground. It is a property that will pay to develop.

WATER.—Tidings, Feb. 17: "Small wonder that the North Star has a large quantity of water to contend with," said a miner to the reporter. In the New Rocky Bar shaft the water is from 60 to 80 feet perpendicular above the New York Hill drain tunnel, which, as reported by the Tidings, has been blocked by a cave or caves. The water is now forced over a "hog's back" and through a crossing into the North Star. Why, enough water can go through that seam or crossing to keep a 12-inch pump busy.

NORTH STAR.—Grass Valley Union, Feb. 15: It has been a hard fight against the water in the North Star, which is supposed to have been receiving a large amount of water from the New York Hill mine, by means of a "crossing" through the country rock. The drain tunnel of the New York Hill mine is caved, which prevents the surface water from being drained off. The water in the North Star mine is being held, but not much progress has yet been made in lowering it.

REDUCTION WORKS AT GRASS VALLEY.—Union, Feb. 15: There is a strong probability that in the near future reduction works will be established at Grass Valley for working the mineral ores of the district which are not free milling, by what is known as the "Pollak Process," which is claimed to be an improvement on the "Newberry-Vautin Process," of which mention has heretofore been made, and the proprietors of which have for the past year been considering as to the erection of a plant here. The "Pollak Process" is held in Scotland, and a request has come from there that ores and concentrates from the North Banner mine, which carry both silver and gold, be sent for a practical test, which will be complied with at once, as the offer is made to bear the cost of transportation. The machinery that will be used for a permanent plant will be heavy and manufactured in Scotland, and inquiries have already been made as to the mode of transpor-

tation, whether by sea or have it sent across the continent by rail, which looks as if the company is ready for business as soon as it is satisfied that the ores of this district can be advantageously worked by that process. The district needs reduction works, as at the present time a large amount of concentrates are shipped off to different points to be manipulated, and this has to be done at considerable expense in the matter of freight and other charges, that could be saved if they could be worked at home. The establishment of reduction works here will be money saved to mine-owners and will have the effect to stimulate vein mining.

THE MENLO MINING PROPERTY.—Grass Valley Union, Feb. 18: St. Louis and London parties have had a working bond on the Menlo mining property of this district for some time, and the date for the commencement of work was to expire on the 1st of March. The owners of the property are James M. Lakenan, M. C. Taylor, Henry Silvester and Peter Johnson, and within a few days they have been advised that the bonders will comply with the terms, and will have a representative here before that date ready to commence operations. The bonders will then have about 15 months in which to satisfy themselves as to making a final purchase of the property at the price agreed upon. They are held to expend a certain amount of money monthly during the life of the bond. The Menlo property consists of the Homeward Bound and Illinois and Wisconsin locations, being on parallel veins. The Homeward Bound is on the same vein as the Lone Jack and Hartery and lies between them. A good hoisting and pumping plant is on the mine and the incline shaft is down about 250 feet. The mine has been standing idle for some years, but the machinery is in good condition and the shaft is also, except that the dirt that has accumulated will have to be cleaned out. As the mine is filled with water, the condition of the drifts is not known, but as the ground is firm there is no reason to suppose that any serious caving has taken place. It is presumed that the work done at present will be principally upon the Homeward Bound. The Wisconsin vein was worked many years (up to 1866), the incline shaft being put down 225 feet, and yielded first and last a large amount of high-grade rock, varying from \$18.50 to \$76.25 per ton. The sulphurets were also of high grade. The Wisconsin is considered valuable, but it needs a considerable outlay of money to put it in working shape.

San Bernardino.

VICTOR.—Los Angeles Herald, Feb. 15: From reliable information just received we are able to report the construction of a 10-stamp gold-mill at the town of Victor, on the Santa Fe railroad, by Messrs. Urban & Garbutt, citizens of Los Angeles and gentlemen of experience in mining and milling business. It is expected the mill will be completed and in full operation within the next 40 days for crushing the ores of the Side-Winder mine, distant nine miles from Victor in the Silver Mountain mining district. The site for the mill was donated by Judge Widney, who laid off the town. From all reports this camp has a very promising outlook. It is also reported that an English company is to put up a mill about 25 miles from Victor, in the Holcomb mining district, to work the ores of the Black Hawk mines. Machinery will also soon be built on the Morongo mining property, 28 miles from Victor, in the Morongo district.

San Diego.

JULIAN.—Sentinel, Feb. 14: Mt. King of the Owens is busy getting in timber preparatory to starting up the mine again. We were informed a couple of weeks ago that work was to be resumed on the Kentucky mine on the 7th of this month, but the owners have not arrived as yet. Messrs. Lane & Smith of Pomona returned on Wednesday and work on the Cincinnati Belle mine will be resumed.

BANNER.—Bryan Ohear, of the Kentucky mine of Banner, writes from St. Louis, Mo. for more samples, which were forwarded yesterday. He says they will commence operations on a large scale by the 15th of March.

Shasta.

SQUAW CREEK.—Cor. Redding Free Press, Feb. 10: Owing to the recent severe storms, the Uncle Sam M. Co. was compelled to suspend operations for a time. The power drill in the James tunnel is in successful operation, and much better progress is being made. During the last month several snowslides occurred, one of them taking the Clipper mill down the canyon. The Riley and Snyder mines had to shut down on account of not having provisions to last during the snowstorm. S. J. Johns, superintendent of the Uncle Sam mine, has returned from the Eureka mills.

LOWER SPRINGS.—Cor. Shasta Democrat, Feb. 16: The party who purchased the B. Swasey mine is here awaiting good weather to commence the erection of a mill on the property. It is understood here that the Hartman M. Co. have let a contract to parties who will drift for the ledge which is supposed to be somewhere near the present tunnel level. The latest report is to the effect that a rich seam of gold quartz has been found near the main tunnel. The tunnel that is in progress on the old Gage place south of the Swasey mine is in 160 feet. The company expects soon to encounter the ledge. Mr. Halley appears to have a good many claimants to his little mine to contend with. The strike has panned out nicely in the last two months. Some of these claimants demand half of the stuff Halley has taken out and others have ordered him off the ground. Such bluff games are often practiced on honest miners who are fortunate enough to find a rich deposit.

Sierra.

CRUSHED BY SNOW.—Mountain Messenger, Feb. 15: The hoisting works and other buildings at the Alaska quartz mine, Pike City, were crushed by the recent heavy snowfall. The middle building at the Primrose mine is crushed in on the east side by the snow, but no very great amount of damage has been done to the property.

Trinity.

NEW RIVER.—Trinity Journal, Feb. 15: Frank Ladd came in from New River to-day. He informs us that John Lewis, who kept a boarding-house at that place, was killed by a snowslide on Jan. 10. Everything is quiet in the camp at present, although Ladd & Clements and the Ridgeway Co. are working their mines, and two men are at work on the Uncle Sam.

NEVADA.

Washoe District.

SIERRA NEVADA.—Virginia Chronicle, Feb. 15: Underground operations resumed Feb. 10. Have repaired the main shaft 120 feet below the 520 level, and at a point 630 feet below the shaft collar are excavating a station on the west side. Operations on the 520 level are suspended.

UNION CON.—On the 145 level in the north lateral drift 100 feet south of west crosscut No. 3, west crosscut No. 4 is advanced 195 feet, and has reached the footwall. Opposite west crosscut No. 4 an east crosscut is advanced 13 feet in porphyry.

MEXICAN.—On the 145 level west crosscut No. 3, 100 feet south of No. 2, from the north drift from west crosscut No. 1, from the main north lateral drift, is extended 63 feet in a porphyry formation.

OPHIR.—On the 1300 level from the end of the east crosscut from the shaft station a south drift is advanced 361 feet, from the end of the east crosscut, 316 feet from the shaft station, continuing in porphyry and quartz.

CON. CALIFORNIA & VIRGINIA.—The 1300, 1435, 1500 and 1600 levels continue to yield the usual quantity of ore. On the 1650 level the raise above the end of the east crosscut from the end of the north drift from the winze, sunk 60 feet below the end of the south drift, is carried up 37 feet, and is in quartz showing some ore. The raise above the end of the northwest drift, from the main west drift from the C. & C. shaft, is up 95 feet and has connected with the winze sunk below the 1500 level north drift, from the Con. Virginia shaft. Shipped to the Morgan mill 1108 tons and 1820 pounds of ore, and to the Eureka 1705 tons and 320 pounds; battery sample assays showing an average value of \$27.65 per ton. Bullion valued at \$53,300 in local assay office.

GOULD & CURRY.—On the 200 level from the southwest drift, at a point 335 feet from west crosscut No. 1, west crosscut No. 2 is advanced 12 feet. Formation porphyry and quartz showing some value.

BEST & BELCHER.—On the 1200 level the north drift is cleaned out and repaired 50 feet. Total distance 245 feet.

UTAH.—On the 600 level the southeast drift from the shaft station is extended 894 feet. Formation soft porphyry, clay and quartz.

OCCIDENTAL CON.—Continue to extract ore of good quality from the slopes on the 400 and 450 levels. The raise 100 feet south of No. 3 raise is up 25 feet and is showing fair quality ore. The 550 level east crosscut is advanced eight feet in porphyry and clay. A south drift from the end of the line west crosscut is extended six feet in porphyry and quartz showing value.

NORTH OCCIDENTAL.—The 550 level joint east crosscut is extended eight feet in porphyry and clay. The north drift from the line west crosscut is extended three feet in porphyry and quartz showing value.

SAVAGE.—Shipped 670 tons of ore, showing an average value of \$23.80 by battery sample assays. Raise No. 1 above the 400 level continues in fair grade ore.

HALE & NORCROSS.—Shipped during the week 860 tons of ore, showing a value of \$19.95 per ton by pulp assays.

CHOLLAR.—During the week crushed 439 tons of ore, pulp assays showing an average value of \$21.75 per ton.

POTOSI.—The 930 level east crosscut continues in low-grade quartz. Repairs to the timbering of the openings on the 630 level still in progress.

ANDES.—Reopening shaft compartments on the 420 level, and timbering station preparatory to drifting northwest for downward continuation of 350 level ore.

IMPERIAL.—The 300 level west crosscut, No. 2, is in porphyry. The 500 level west crosscut continues in quartz. The 500 level north drift is out 1390 feet from the Yellow Jacket shaft.

ALPHA.—The 600 north drift is showing some pay ore. The 500 level west crosscut is in low-grade quartz.

EXCHEQUER.—The 500 level east crosscut at the Alpha line continues in quartz and porphyry.

WARD COMBINATION SHAFT.—The 1800 level east drift is advanced 205 feet.

OVERMAN.—Shipped 200 tons of ore of fair quality. The 1200 level northeast drift is showing good ore.

NEW YORK CON.—Opening a station on the 600 level at the top of the raise above the 800 level.

CALEDONIA.—West crosscut No. 3 continues in low-grade quartz and porphyry.

YELLOW JACKET.—Shipping 80 tons of ore daily of the usual grade.

CROWN POINT.—Shipped during the week 850 tons of ore, showing an average value of \$19.50 per ton by pulp assays.

BELCHER.—The 850 level east crosscut continues in porphyry. The 200 level south drift is in quartz and porphyry. The 600 south drift is out 70 feet.

SEG. BELCHER.—Ore bunches still showing in the 1200 level drift from the winze.

SILVER HILL.—Usual progress made in 160 and 260 level explorations.

JUSTICE.—The mill is crushing 45 tons of ore daily of the usual grade.

ALTA.—Mill crushing a daily average of 45 tons of ore extracted from the 825 and 925 level slopes.

Law's District.

MINERS.—Reese River Reville, Feb. 12: W. H. Williams, who has charge of the Eagle mine at Lewis, wrote to Sam King here for six men to take a contract to run a drift at the mine on fair terms. Sam sends the following miners: Wm. Luke, Richard Burroughs, Andy Erickson, Maurice O'Brien, John Bennetts and W. H. Bennetts.

Tuscarora District.

NORTH COMMONWEALTH.—Times Review, Feb. 14: 1st level: North drift from No. 1 crosscut has been advanced 10 feet and is still showing high-grade ore. 2d level: Joint crosscut has been extended eight feet; face in vein matter giving low assays. Have had to timber, which has retarded the work.

YOUNG AMERICA SOUTH.—Have done more repairing during the past week than mining, owing to the increase of water from melting snow. West drift from west shaft has been driven 53 feet on hanging-wall of ledge, 1st level. West drift from west shaft extended 5 feet on ledge; ore low grade.

GRAND PRIZE.—North 400-foot level crosscut from west drift extended 10 feet. 500-foot level:

West drift on north lateral extended eight feet without change. East drift on north lateral No. 2 extended 13 feet; face showing 14 inches of ore. A crosscut has been started from the north lateral and is in seven feet.

DEL MONTE.—1st level: A drift has been started from No. 2 crosscut to open up ore cut by the crosscut. The ore is high grade. North drift from No. 1 crosscut has been advanced seven feet. The drift continues all in ore; average of first-class, \$10.34 per ton. 2d level: Joint crosscut has been advanced eight feet in vein formation, and looks favorable for ore. 3d level: North drift from joint crosscut has been extended 18 feet, showing quite an improvement in the grade of the ore since last report.

COMMONWEALTH.—1st level: East drift from No. 1 north drift advanced nine feet; total, 61 feet, developing fine ore. No. 10 north drift extended 14 feet. North drift from No. 5 chute has reached the North Commonwealth line and still shows good ore in the face. Upraise from No. 5 chute extended upward 16 feet, total 44 feet; ore in the top is low grade. Dolan drift extended 12 feet; continues to show good ore. 2d level: No. 2 east crosscut has been extended 11 feet in favorable-looking formation. No. 3 east crosscut advanced 16 feet, cutting small seams of ore. 4th level: North gangway has been advanced nine feet; 150 feet has had to be timbered, all of which has been completed, and drifting can be pushed. All the stopes continue to look well. Hoisted during the week 640 tons of ore. Average battery pulp at the mill for the week, \$263 per ton; average battery at concentrating plant, \$19.98 per ton. Bullion shipped, \$35,839.24. The mill was shut down 48 hours to make some alterations in the flues, but is now running nicely and doing good work.

ALASKA.

BEAR'S NEST MINE.—*Juneau Free Press*, Jan. 25: A fine body of quartz has been cut in the long tunnel of the Bear's Nest mine, and good quartz had been encountered in the upper tunnels. The long tunnel is now driven nearly 20 feet in solid quartz, which thus far has given very satisfactory average returns, the quartz in the upper tunnels also assaying well. A survey made by Mr. Bernhardt's engineer along the line of the long tunnel revealed the fact that the tunnel had been stopped under the old management nearly 100 feet short of the vein, and in about that distance a vein of quartz has been encountered. The old management must certainly have been aware of the number of feet of tunnel that would have to be run to reach the vein, as several surveys had been made on the ground, and why the tunnel was stopped nearly 100 feet short is a mystery to many.

ARIZONA.

CHLORIDE.—*Mohave Miner*, Feb. 15: James Cadden has struck a fine streak of rich chloride ore on the Kanawha Belle near Chloride. Thos. MacMahon is about to make a shipment of good ore from his lease on the Prince George. A large shipment of rich chloride ore will soon be made from the Jennie mine in Weaver district. Stephen Smith is getting some very high-grade ore from his tunnel under Serrum this week, and men will continue to be added to the force as fast as room can be made for them. The Esmeralda mine, owned by Otto F. Kuencer and Chas. Gross at Cerbat, upon which Joseph Prisk and Reese Jones have a contract, shows four feet of gold and silver ore in the bottom of the shaft. It is rumored that Heimrod McDuffie and McKinnon have bonded the Sunset mine to outside parties for a snug sum. The bond extends for 30 days, and the owners have a contract to sink the shaft, which is being done as rapidly as possible. The bottom of the shaft shows a six-inch streak of ore carrying much gray copper and assaying from 250 to 9000 ozs. in silver and from 2 to 4 ozs. in gold.

OUTLOOK FOR TUCSON.—*Citizen*, Feb. 12: Tucson merchants are by no means discouraged on account of the outlook for business during the year 1890; nor should they be. Certainly all things are as favorable now for a good business year in Tucson as they have been at any time during the last half decade. The mining camps from which a large share of our trade comes are in good condition, some of them far ahead of what they were a year ago. But one camp is called to mind now that might be said to be in an inactive state; even at the Quijotas work is continued in the mines, and in all probability the mill will again start up soon. On the other hand, good camps that have for several years been dead, have recently sprung into activity, and miners have been put to work and mills to reducing ore to bullion. Business comes to this city from all over Southern Arizona and the outlook for trade is good. The Mammoth bids fair to become the largest camp in the Territory during the next six months, and the Mammoth draws its supplies from Tucson. Whatever is necessary to be done to improve the road to Mammoth should be done by co-operative action among our business men. Good roads are a great help to any city.

THE OLIVE MINES.—*Star*, Feb. 12: News from the camp continues good. Compared with this time last year, a much better showing is made by the various mines. The Olive went ahead of its record last month and shipped 25 tons. The ore is now in the sampler. The owners of this mine sell the ore to Mr. Wores, who ships it to Socorro, N. M. Mr. Messersmith hauled in some ore yesterday. He stores it in his place here in town till he has a shipment. Work on the Annie mine has been resumed. J. Campbell has a working bond on two mines belonging to Y. Johnson, the teamster hauling ore from the mines, and will buy the mines if work he is now doing develops good ore. Other working claims in the district are taking out paying ore. Some that never took out any before are now bringing to light good ore.

COLORADO.

CENTENNIAL.—*Georgetown Courier*, Feb. 14: The Centennial is once more a big producer. A shipment of 25 tons of ore was made a few days ago. It is the intention of the management to continue sinking. H. H. Atkins and L. C. Snyder have leased their Carr mine in Lake district to a pool of practical miners. The Carr at one time was one of Gilpin's most profitable mines. The main shaft on

the Colorado Central is down 420 feet below the Marshall tunnel, or 800 feet from the surface. A new set of levels will be started when the shaft is 30 feet deeper. The Seven-Thirty is turning out immense quantities of ore at present. Tissot & Co., Pulsifer & Co., Gehrna & Co. and J. Griffin have each made carload shipments within the last week. Renneroni & Co. will soon have a millrun of several hundred sacks.

DAKOTA.

THE CALUMET.—*Deadwood Pioneer*, Feb. 15: Our reporter yesterday availed himself of an opportunity to visit the Iron Hill Mining Company's recent purchase, the North Star and Black Sulphate claims, Ruby Basin. The mines, as has before been stated, were formerly owned by the Calumet Company, and are perhaps best known by that name. Of the two claims, by reason of the greater amount of development it has received, the North Star is today the more valuable—indeed there are expert mine engineers who do not hesitate to declare it in their opinion because of the strength and continuity of the ore body, the most valuable mine in Ruby Basin, where are situated some of the best properties in the hills. The mine is worked through a tunnel 400 feet long. From mouth to face this is all in ore, which found first near the surface, dips at a very small angle until when end of the tunnel is reached one is possibly 30 feet under ground. The ore body for the first 100 feet is about four feet thick on each side; after this it begins to gradually increase in size until in the face of the tunnel it becomes rather more than less than six feet thick. Two crosscuts have been made, one 66 feet, the other 48 feet long. In neither of these has either wall been found. The ore is everywhere. On the Black Sulphate, adjoining, a tunnel is now being driven; the ore body was only struck night before last; assays had not been made yesterday, consequently the value of the ore could not be learned. The North Star ore carries both gold and silver, contains some iron and sulphur and is peculiarly well adapted to treatment by pyritic smelting, inasmuch as in it is found at least some quantity of each of the elements required for flux in that process. It is to-day among the best mining properties in the country and will doubtless soon rank with the great producers of the precious metals.

IDAHO.

BIG LOAD OF BULLION.—*Challis Messenger*, Feb. 8: Lawrence Green and Geo. Phillips were in Challis Friday night, from Willow creek divide. From Mr. Green, one of the owners of the Clayton Mining & Smelting Co., we learn that the company has on the road to Ketchum and under his charge over 1100 bars of bullion—about 60 tons—and that he expected to be able to deliver it at Ketchum in about a month. He has nine men and eight four-horse teams engaged in moving it and had nearly all of the bullion on the Willow creek divide at the time he was in Challis. From there he will move it all to Dickey's, going over the road as often as necessary to do so, where it will be unloaded. From there to Riverside in like manner, then to North Fork, then to Summit, then to the foot of the big grade, then to Ketchum. He expects and intends, with this large force of men and teams and by making short hauls and doubling the road so frequently, to deliver that bullion, no matter with what quantity of snow and blockades he has to contend.

WOOD RIVER.—*Times*, Feb. 12: There never was a time in the history of Wood River when the outlook for a prosperous season was as good as it is at present. The Minnie Moore is as good a mine as ever; the Queen of the Hills has just struck another extensive bonanza; the Idahoan shows a 2½-foot vein of high-grade ore which has already been cut and defined on the 600, 700 and 800-foot levels; the Jay Gould has a large quantity of ore in sight; the Red Elephant group shows vast bodies of ore; the Red Cloud has from \$300,000 to \$500,000 worth of ore in sight, with every indication of an enormous bonanza in depth; the Noy Aug mine has a good-sized ore body in sight; the same can be truthfully said of the Emery and War Dance; McFarlane & Mahoney's Abbey is evidently a mountain of ore; the Triumph Co. are anxiously awaiting the reopening of the shipping season to start up their concentrating works; the news from the Carrie Leonard, King of the West, and other Snooky properties is highly encouraging; and the Elkhorn, Vienna, and several other properties are evidently being put in shape to make a good record next season. This for the galena belt mines. But the most encouraging features of the situation are found on the Gold Belt. This important region, which has heretofore only been run over by prospectors, seems to have been at last put in the way of making a showing. The Camas No. 2 mill, when it runs at all, yields between \$200 and \$300 per day, of which fully \$200 would be profit if a sufficient supply of water could be had. The Tip Top mill, though started up at the wrong time in the year, is making a creditable showing; and the Champlain mill, now that the stockholders have stopped quarreling among themselves, will be started up as soon as the weather permits. The Gold Belt has always, and justly, been considered the backbone of this region; and if it can once be started, it will insure a prosperous future not only to Hailey, but to Ketchum, Bellevue, and this whole region.

LOWER CALIFORNIA.

GOLD DUST AND BULLION.—*Lower Californian*, Feb. 12: Alamo has at last begun to pick up in a business way, judging from late advices. The weather is much better than for some time. It will surprise a great many people to learn that in the two weeks ending on the 10th inst., there were \$3000 in gold dust and bullion received by merchants in Alamo in the usual course of business. This is a fact that attests the richness of the camp, when it is remembered that rain and cold weather have greatly hindered work in every direction. Now that spring is near, it is confidently expected that the placer discoveries of last year will be duplicated, not only in the Alamo district, but in all directions, for every prospector knows that Alamo is but one of many sections which are rich in placers and ledges, the discovery of which is liable at any time to create a great excitement. George and Charles Miner run 1670 pounds of ore from their Waldine mine through Lane's mill, on the 3d, which yielded

\$205.04, or at the rate of nearly \$250 per ton. It is the best millrun ever made at Alamo, and will direct attention to the Waldine. The mine is located between the Elsinore and the Iron Mask, and originally belonged to Capt. Frazier, who called it the Annie. The International Co.'s Grandota mine has turned out well—that is, it has turned out as an artesian well, from all appearances. The shaft is full of water, and although attempts are being made to pump it out, the shaft remains full, and consequently no development is being made on the mine. The International Co.'s mill resumed work on the 1st, on ore from the Ciccero, St. David, Telemaco and Spider. During the recent slack period the company has kept a force of swamper at work getting out ore. Quite a number of Chinamen are now at work in the placer diggings between Lane's mill and the Princess mine. Rich silver ore has been discovered on the division line between the Aurora and Princess mines, at a depth of 30 feet. At the upper works on the Aurora the men are down 45 feet. The vein is 1½ feet wide and runs permanent, the grade of the ore being from \$35 to \$10. The lower works have resumed on the old possession shaft, and are under contract to Tirso Martinez, who is working along the 8-inch vein of ore, which is full of galena and free gold. Thirty tons of this ore is now ready to run through Lane's mill. The Aurora has up to date produced 178 ounces of gold. Mathewson & Vaughn, the contractors at work on the Americana, are down 40 feet on the new works. The ore on the dump at the Americana at present is from the 40-foot drift and will average \$30 per ton. Thirty-one tons of ore from the Encantada contract are at Moore's mill ready to be run through. Ten tons of ore from La Flor mine, located in the French camp ten miles southeast of Alamo, yielded \$29 per ton in one of the mills here the other day. The owners had to pay \$10 per ton for hauling the ore to mill. The shaft on the La Flor is down 25 feet.

MONTANA.

THE MOUNTAIN CON.—*Butte Inter-Mountain*, Feb. 11: At the Mountain Con. the company are taking precautions for the future safety of the underground workings. About half a dozen men are loading waste into cars and sending it down into the mine to fill in the many stopes now worked out. About 175 men are employed on a shift, and the company daily hoists about 600 cars of ore. This mine is under the personal management of Joseph Laird.

THE WAKE UP JIM.—The Green Mountain and Wake Up Jim, under the foremanship of Harry Hurley, former foreman of the Anaconda, is giving employment to about 75 miners on a shift at each mine, and sending to the smelter at Anaconda its quota of ores.

THE HIGH ORE is under the personal supervision of Patrick Kane, who formerly had the direction of affairs at the Anaconda, and he is bringing this property up to the standing and capabilities almost of the mammoth St. Lawrence, over which he so long presided. There are about 80 miners on a shift and they hoist on the day shift from 300 to 400 and on the night shift from 500 to 600 cars.

AT THE ANACONDA everything seems lonesome and deserted in comparison with its former life of activity, and no one pursues his calling there except the watchman. The engines are covered with a coat of white lead to insure them from rusting. One thing very noticeable about the works is the strong smell of smoke and gas emanating from the shaft. A hole is cut in the bulkhead of the Anaconda shaft so as to determine the amount of water by a rope connected with a weight attached to it. But the exact amount in the mine could not be learned, as that is kept profoundly secret by the company and its employees.

AT THE ST. LAWRENCE.—Back of the hoisting works are perceived some large cracks about where the old cave occurred some time since. They are open from two to three inches and one could easily drop a wedge into them running from 100 to 200 feet, and the cracks are many in number. Some claim that it is the effects of the extreme cold weather cracking the ground, but as they are directly over that great bulk of timber where the fire was raging, it seems to lead one to infer that it is effected by that cause. The engine is much out of place and before the fire it was the intention of the company to replace it, but from the present state of affairs it will be almost a necessity to reset the bed before any more hoisting of importance can be performed.

NOTES.—The Mountain Con., as well as the other mines of the Chambers syndicate, gave the boys a breathing spell yesterday and last evening. It is stated it is owing to the smelter being out of order at Anaconda. The mines, when in operation, seem to be more than a match for the smelter. The ore bins are all full to overflowing. The Major Budd, which has for a few days past been in a state of suspension, is about to resume operations.

NEW MEXICO.

PIÑOS ALTOS.—*Silver City Enterprise*, Feb. 14: It is said that every mine at Piños Altos, now working, which includes all the prominent ones except the Pacific, is paying expenses and something besides. There are not so many men working in the camp now as there have been during the boom, but more real mining is being done and in a manner much more satisfactory to those interested. There can no longer be a question as to the future of the camp. It has passed through its experimental stage.

BLACK HAWK.—Malcolm McGregor & Co. have got the water out of the shaft on the Good Hope mine and found a three-inch streak of very rich ore in the bottom. They are much encouraged and will sink the shaft as rapidly as possible, preparatory to driving a level for the development of the ore body. On the Red Cloud mine across the gulch on the same vein the lessees are taking out ore of the same high grade. Uncle Ben Hobson has a fine showing for a big mine on the northeast extension of the Red Cloud. At a depth of 40 feet, below the tunnel level, there is a pay streak of 20 inches of ore ranging in value from 100 to 700 ounces in silver, while he is cording up large quantities of 20 to 60-ounce, third-class. Charley Caldwell has a lease at the face of the tunnel and is sinking a winze on the vein with encouraging prospects of striking pay ore. Miller and Dodd, because of sickness in their families, have not been rushing work on their Alhambra mine for the past month, but John Dodd, who is

leasing on a portion of the mine, is extracting a large quantity of the rich ore which has made the Alhambra famous. D. P. Carr has secured from Miller and Dodd a lease for one year on the first 200 feet south of the main shaft on the Alhambra mine. A tunnel has been driven in 70 feet, and Mr. Carr will drive it to connect with the second level which extends 60 feet south of the main shaft. Those familiar with the mine are of the opinion that Mr. Carr has secured a valuable lease. He will go to work on it at once. The leasing system cannot fail to prove a success in Black Hawk and a revival of the mining industry in that camp may be expected at an early date.

A SILVER MILL FOR KINGSTON.—*Shaft*, Feb. 8: Chandler & Daily will remove their mill from Cold Springs, near Hillsboro. To the present machinery will be added settlers, pans, and all the improved machinery used in the successful treatment of silver ores. If the plant now being erected treats the Kingston ores with any degree of success it will determine most favorably the future of Kingston.

SILVER MINING COMPANY.—This mine remains as in the past the greatest silver mine in New Mexico. It is the best equipped mine in the Southwest, and under the management of Walter C. Hadley is paying all the time. Up to date the mine has produced \$9,000,000 of silver bullion. At the present time it is producing 2000 ounces of silver per day without crowding. It has abundant ore reserves, and the production will probably not vary during the year. All the machinery on the mine is now run by compressed air. At the present time 115 men are at work on the mines and in the mills. Peter Kinney, of the Log Cabin mine, visited Kingston during the week, and reports prospects bright. He and his partners shipped another car of high-grade ore last Wednesday. The mines on Trujillo creek are again looking up. We understand that an important sale will be made in that section soon. The Bonanza-Good Hope Mining Company has completed arrangements, and will build a substantial gold mill near Hillsboro, for the treatment of their ores.

A SALE.—*Southwest Sentinel*, Feb. 4: John M. Wright, representing R. F. McComas and others of Nebraska City, has purchased the Last Chance mine, on Silver creek, and paid therefor \$25,000 in cash. This mine is an extension of the Confidence, recently purchased by Denver parties, and is considered a valuable property. Last Saturday Mr. Wright let a contract for the running of a 100-foot working tunnel on the property. He says the ore body is an extensive one, and lies very advantageously for rapid and cheap mining, thousands of tons being in sight. "We'll have a large stamp-mill on the property as soon as possible," said Mr. Wright. Referring to the Silver Creek district in general, he said it was a very promising section, but was sorely in need of a good wagon-road.

OREGON.

THE MINING OUTLOOK.—*Bedrock Democrat*, Feb. 10: The mining outlook for Baker county was never brighter. With the opening of spring, great activity will be manifest in every district of this section. The snow in the mountains which is piled up many feet deep, will afford an abundance of water for the working of the hundreds of rich placers, which for the past two seasons have remained idle, owing to the scarcity of that all-important factor—water. It is true that a large number of our placer mines are supplied with water by ditches and that the output of gold from them last year was great, but with the assurance of an abundance of water, supplied by the deep snows in the mountains, the season will be prolonged and the output from these places will doubtless be manifold. From the different mining camps which are tributary to Baker City come reports that the outlook is most promising. Besides the output from the placers there is every assurance that rich quartz mines in Baker county will continue to prove that the undoubted faith of the owners was not misplaced when they expended thousands of dollars in development and placing extensive plants thereon for the reduction of the ore. Early in the spring the stamps of the numerous mills erected last year will commence falling and will enliven the whole county. A large number of new plants will be erected in the different sections the coming summer, and the prospect for a prosperous year is encouraging to the most sanguine. When the mineral wealth of Baker county is made known to the world, Baker City will become one of the greatest mining centers of the country. It is plainly evident, and it will only take time to prove the assertion, that the day is not far distant when capitalists will see one of the greatest fields ever presented for the establishment of large reduction and smelting works. That it would prove a profitable investment from the start, cannot be doubted. It would afford the mine-owners, who for lack of means are unable to put machinery on their properties, an opportunity for working their ores and thereby greatly increase the output of the mines of this section.

UTAH.

EUREKA.—*Cor. Salt Lake Advertiser*, Feb. 14: The Eagle mine is looking well and promises to rival any of the big mines in time. Chief Gardner has the pipe laid from the Beecher millsite and everything is in readiness that could be done during the bad weather. The hoisting engine will be placed as soon as practicable, and when started will keep a steady stream of ore pouring from the reserves that have been uncovered this past winter. Captain De Prizen is at work on the Solid Muldoon, and like everything he touches, is making a mine of it. It is very strange that more work is not being done here where energy and pluck have invariably been rewarded. Burns & Nelson are at work on the Equator, and expect to strike a bonanza before they reach the 100-foot level. The shaft is showing up some good quartz and metal. Dick Tone is uncovering a strong vein in the Retribution. John R. Davis has quit the Sacramento and is going to work on the Mammoth side for a grub stake. This is a very promising prospect and needs but depth to show up lots of pay ore. Tintic during the week ending February 4d, shipped 1850 tons of high-grade ore. How is that for high? And yet there is but little mining being done. The companies are crying aloud for more cars, and when spring opens will increase the output.

MECHANICAL PROGRESS.

Electric Welding.

Electric welding appears to be making rapid strides everywhere. The process is the invention of Elihu Thomson and was first publicly exhibited by him in New York only three years ago. Since that time its progress has been really wonderful, and it has become very prominent among the rapidly-growing applications of electricity. It was one of the most important features in the electrical department at the late Paris Exhibition. It is now being introduced in England. A late number of *London Iron* says:

"Now, at length we have it in our midst, a practical installation having been laid down in Fanshawe street, Hoxton, London, where we recently inspected the satisfactory working of the system. The principle involved in Prof. Thomson's invention is that of causing currents of electricity to pass through the shutting ends of the pieces of metal which are to be welded, thereby generating heat at the point of contact, which also becomes the point of greatest resistance. At the moment of heating, mechanical pressure is applied to force the parts together. As the electric current heats the two pieces of metal to the welding temperature, the pressure follows up the softening surface until a complete union or weld is effected, and, as the heat is first developed in the interior of the parts to be welded, the interior of the joint is as efficiently united as the visible exterior. With such a method and apparatus, it is found possible to accomplish the welding not only of the common kinds of iron and steel, but of metals which have hitherto resisted attempts at welding, and have had to be brazed or soldered.

"The weld commences at the center of the shutting pieces, and approaches radially toward the exterior. The apparatus is simple, and is in complete control of the operator, who brings the current on and releases it at will, and regulates the pressure brought on the impinging parts of the article to be welded. The time occupied in making a weld varies from a few seconds to a few minutes, according to the sectional area of the parts to be united. The cost is said to be but small in the case of plant laid down for constant use. Of course, if used only occasionally, the cost will rapidly rise, but this is not the intended application of the process. It is specially fitted for use where the operation of welding is being constantly performed, and in this respect it is adapted practically for every class of welding or heating. Pieces of such metals and alloys as steel, wrought iron, silver, copper, brass, lead, tin, zinc, bronze, German silver, platinum, gold and even cast iron, are not only welded to each other, but different metals can be welded one to another in many combinations, extending the applications of the process to the attainment of results hitherto impossible in metal working. The tensile strength of the welds, as shown by mechanical tests, is equal to the very best welding by the ordinary system; in fact, it is superior to it, inasmuch as the risk of dirt and burning is avoided."

We may add that in small and delicate work the current is cut off, automatically, the instant the weld is completed. The welding current is of extremely low pressure, so much so that it is claimed there is absolutely no danger from it, and the machinery may be freely handled with impunity. The process will soon be very generally introduced throughout England and Scotland, and on the continent as well.

The United States Navy Department will no doubt soon introduce it into the various navy yards. The department has just issued an order directing a board of officers to visit Boston to examine into the working of the system, and to report upon the adaptability of the process for welding boiler flues, etc., for use on the men-of-war. Chains used on naval vessels are all made at the Boston navy yard, and it is thought that the new machine will find employment at that station, as the welding can be done much stronger by that means than by methods heretofore in use. The wire used for wrapping the experimental "wire-wound guns" can be much more effectively joined by electrical welding than by any system of soldering so far tried.

WEAR OF TIRES.—Experiments which have been made recently on the Austrian State railroads with wheel-tires of Krupp's crucible cast steel and Martin steel, have yielded interesting results. For the purpose of the trials, three wheels on one side of a locomotive were furnished with tires of one kind of steel, and those on the other side with tires of the second kind. The profiles, to start with, were, of course, exactly alike. After two years' running, measurements of the profiles showed that the Krupp steel tires had worn down, on an average, ten millimeters (about 0.4 inch), while the Martin steel tires had worn down 14 millimeters (about 0.56 inch). Including the weight of metal removed in again turning down the tires to the normal profile, the weight lost, due to wear, was 40.4 kilograms (88.88 pounds) in the case of Krupp tires, and 56.4 kilograms (124.08 pounds) in the case of those of Martin steel.

A MARINE ENGINE WITH EIGHT CYLINDERS. It is said that the well-known firm of Ansaldo-

Bombini, in Sampierdarena, have recently completed the colossal engines and boilers intended for the Italian ironclad *Sicilia*. The engine is constructed to work up to 19,500-horse power, and it is the most powerful engine constructed in Italy. It is constructed on the compound principle, with eight cylinders and four surface condensers. It drives two four-armed screws, which have a diameter of six meters. The weight of the boilers is 500 tons, and the total weight of the engine and boilers is 1740 tons.

Flexible Pitman.

A decided novelty has been brought out and developed in successful operation, and is now being manufactured by the Van Allen Automatic Pitman Mfg. Co. of Rochester, N. Y., by whom the patent is owned and controlled. The purpose of the invention is to supply a pitman which shall overcome the well-known trouble of dead centers, which has long been a perplexing problem. The trouble ordinarily encountered with the dead center is in starting up, requiring the operator to turn the balance wheel as an initial movement. The new pitman prevents not only stopping on a center, but it is also arranged so that a backward or contrary revolution is impossible, hence avoiding the disastrous results liable from such event. The device is exceedingly simple and is designed to supplant the old treadle without necessity of alteration of the machine, and this adaptability is a very valuable feature. The new pitman is something like the old, with about half of the central portion cut out, leaving the crank end and the treadle end projecting toward each other. The space between is occupied by a flat recurved spring, whose ends are respectively clamped to the crank end of the pitman and the treadle end. This forms a spring treadle elastic in the direction of revolution. The pitman stub attached to the treadle is arranged to be inclined back and stayed rigidly, which brings the spring portion to a stress that will prevent the crank from settling on a dead center when stopping. This stress or tension can be adjusted to any desired degree. On the wrist or crank pin is an attachment embodying a small ratchet wheel and pawl, so arranged that the pawl engages the ratchet should the operator start the motion the wrong direction, and this will prevent breakage of the thread or needles. An immense field is open for the introduction of these improvements and large profit is assured.

EDISON AS A THINKER.—We are so accustomed to look upon Mr. Edison as one whose mind is constantly engrossed in some specific work that it is refreshing to be allowed a glimpse of his more spiritual nature, as brought out by Geo. P. Lathrop's "Talks with Edison" in the February *Harper's Magazine*. As a thinker, Mr. Edison is no doubt truthfully pictured as one who can instantly transfer the full power of his creative mind from one subject to another without losing anything by the sudden change; and can, indeed, almost follow out simultaneously the threads of thought on a number of subjects. Mr. Edison makes a sharp distinction between discovery and invention, we are told, and it is as an inventor that he prefers to be known; that is, as one who sets about deliberately to accomplish a certain object, as distinguished from one who discovers, perhaps by accident, what has long been sought for. Very few of his inventions, says Mr. Edison, and those of the least importance, were the result of accident, and most of them were hammered out after long and patient labor, and no doubt often stimulated by the encroachment of rivals. The perfected incandescent lamp, which Mr. Edison considers his most important invention, has been the result entirely of deductive reasoning, in connection with which he has set up no less than 3000 theories to explain the phenomena observed. But in only two cases have experiments proved the truth of the theories assumed. Our readers may also be interested to know that Mr. Edison is a believer in an intelligent Creator.—*Electrical World*.

A STEEL POLISH ON IRON.—Pulverize and dissolve the following articles in 1 quart hot water: Blue vitriol, 1 ounce; borax, 1 ounce; prussiate of potash, 1 ounce; charcoal, 1 ounce; salt, $\frac{1}{2}$ pint; then add 1 gallon linseed oil, mix well, bring your iron and steel to the proper heat, and cool in the solution. It is said the manufacturers of the Judson governor paid \$100 for this recipe, the object being to case-harden iron so that it would take a bright polish like steel.

A MACHINE CHISEL.—While strolling through the Paris Exhibition, Mr. Edison accidentally hit upon a tool that he calculates will save him something like \$6000 a year. It is a chisel worked by hydraulic pressure, and will enable him to reduce his labor by 18 hands.

GERMAN MAKERS assert that their steel engraving tools possess the hardness of a diamond. The method employed is said to be to heat the tools to a white heat, plunge repeatedly into sealing-wax until cold, and then just touch with oil of turpentine.

DON'T use emery to grind in brass cocks; it imbeds itself into the soft brass, and keeps on grinding itself out of true after the cock is put in use. Use grindstone grit; this cuts brass well, and will wash off by using water.

SCIENTIFIC PROGRESS.

Researches in Magnetism.

A paper was recently read at the Royal Society, London, being Part III of an extensive research which is in progress by Mr. Thomas Andrews, F. R. S., Sheffield, on "Electrochemical Effects on Magnetizing Iron." Parts I and II of this work, published in the Proceedings of the Royal Society, contain the results of a study of the electrochemical effects observed between a magnetized and an unmagnetized bar of iron or steel when in circuit in certain electrolytes, and the effect was found to vary with the nature of the metal and solution employed, and also with the extent of the magnetization of the metal. The average result of many repeated experiments showed that a magnetized bar became electro-positive to an unmagnetized one.

Experiments were also made showing that local currents were developed in a magnetized bar between the more highly and less magnetized parts thereof, when the iron or steel rod was immersed in suitable solutions acting chemically upon it. Interesting experiments have also been made in connection with the influence of magnetization on the action of nitric acid on iron and steel. The general conclusion arrived at from the experiments in Parts I and II was that, under the conditions recorded, a magnetized bar was electro-positive to an unmagnetized one when the two were immersed in certain solutions, and that the extent of the result was in some degree dependent both on the nature and strength of the solution, and also on the extent of the magnetization of the metal.

Part III contains the results of a further series of original and interesting experiments on obscure magnetic phenomena. Indications were afforded of the extent of the current flowing between the polar terminals of steel magnets under certain conditions. Mr. Andrews investigated the influence of the earth's magnetism on these reactions, and above a year has been devoted to the study of this part of the subject. In connection with the research, the influence of magnetization on the chemical action of certain solutions on iron and steel has been carefully studied in its various aspects. Mr. Andrews' previous researches on the corrosion of metals during long exposure in sea-water have shown that steel corrodes more rapidly in sea-water than wrought iron, a conclusion which practical experience confirms. It was also made evident that magnetization exerts an influence tending to increase the corrosibility of steel, which metal, as is well known, after once having been magnetized, retains more or less permanent magnetism.

The use of wrought iron many years ago for shipbuilding introduced appreciable causes of deviation in the ship's compass, and observations have been undertaken by naval authorities with a view to obtaining "a clear understanding of the cause of magnetism of iron ships, and the changes to which such magnetism is liable when the vessel's position is altered geographically or in respect to the magnetic meridian." Inasmuch as the power of magnetic retention in steel far surpasses that of iron, it follows that steel vessels may gradually become permanently magnetic from the influence of the earth's magnetism when pursuing their voyages in certain directions. Magnetic influence tends to increase the corrosion of steel, and we may possibly herein find an additional cause of the greater corrosibility of steel vessels, compared with iron ones, when long exposed to the action of sea-water.

IRON SHIPS AND LIGHTNING.—The *Electrical Review* points out that, although the modern man-of-war is not the thing of heauty which was presented by its prototype, it has one advantage at least not possessed by "the wooden walls of old England." This advantage is found in the very few occasions which are recorded upon which the iron-clad ships have been struck by lightning. It cannot be said that the modern vessels are actually exempt from injury by lightning, but they are so far protected by their construction, and the material used in that construction, that when struck the results are trivial, and have often, in fact, been ascribed to the mischievous action of some one on board the vessel. In the old days it was very different; during a period of 50 years 200 ships of our navy were struck by lightning, and in one case five vessels were struck during a single night, the number of fatalities resulting therefrom being considerable.

PHILOSOPHY OF THE EFFECT OF OIL ON WAVES.—In an article on this subject which appears in *Nature*, the writer states that the true part played by this oleaginous film in diminishing the disturbance of the sea seems to be that of a lubricant. Waves are formed by the friction of wind and water. Any force, therefore, that tends to lessen the friction reduces the violence of the waves. This anti-frictional force of oil can hardly be overestimated. The Atlantic waves have been calculated to exert an average pressure during the winter months of 2086 lbs. per square foot. During a heavy gale this pressure is increased to 6983 lbs.; yet the thin oil blanket is sufficient, when applied under certain conditions, to enable a vessel to navigate through them in perfect safety, their oiled summits raising

themselves in sullen grandeur, but never breaking aboard. What the exact coefficient of friction between air in motion and water is, and the proportion of its reduction by oil or other lubricants, are questions that open up a most interesting subject of inquiry, the solution of which will prove beneficial to the whole nautical and mercantile world. The use of oil for the safety of vessels in stormy weather, which was for years ignored by scientists and very generally by sea captains, is now becoming quite general. A Norwegian engineer directs attention to the important point of selecting the most suitable oil. "A fat, heavy animal oil, such as train oil, whale oil, etc.," he says, "is decidedly the best; but as these oils in cold weather become thick and partly lose their ability to spread, it is advisable to add a thinner mineral oil. Vegetable oils have also proved serviceable. Mineral oils, especially refined ones, are the least effective. Crude petroleum can be used in case of need, but refined petroleum is hardly any good at all."

SOME EXPERIENCES WITH ZINC.—Zinc is often used in boilers and hot-water tanks to prevent the corrosive action of the water on the metal of which the tank or boiler is composed. The action appears to be an electrical one, the iron being one pole of the battery and the zinc being the other. Under the action of the current of electricity so produced, the water in the tank is slowly decomposed into its elements, oxygen and hydrogen. The hydrogen is deposited on the iron shell, where it remains. It will not unite with iron to form a new compound, but if any iron rust (known to the chemists as oxide of iron) is present, it will remove the oxygen from this and deposit the metallic iron on the plates. The oxygen of the water that is decomposed, instead of going to the iron, goes to the zinc and forms oxide of zinc, and in the course of time the zinc will be found to be almost entirely converted into oxide, only a small fraction of the original metal being left.

INSECTS IN DRUGS.—At a recent meeting of the Chemists' Assistants' Association, Mr. C. J. Strother showed a number of drugs infected with animal life, and remarked that the first, a fair-looking sample of crushed linseed, supplied about three weeks before by a large wholesale firm and kept in a wooden cask with a cover of wood, was seen under a lens to be literally alive. The next was aconite root, of which the parasite was quite different. Nuxvomica and cantharides were the remaining specimens. With the last named it is usual to put camphor, though with doubtful effect; but it is possible that washing hard substances in a solution of salicylic acid, and quickly drying them, might protect them. The question naturally arises, What would be the effect of a poultice containing thousands of insects applied to an open wound, especially if the poultice be made with hot instead of boiling water?—*Pharm. Journal*.

PSYCHICAL RESEARCH.—The American Society for Psychical Research, after existing for five years, with its headquarters at Boston, and publishing some 600 pages of "Proceedings," at last, for pecuniary reasons, terminated its corporate existence on Jan. 14. The English society of the same name is heir to its documentary possessions, and is to keep Dr. Richard Hodgson, late secretary of the American society, as its own secretary in America. A majority of the associates of the American society have joined the English society, forming the nucleus of an American branch. Prof. S. P. Langley of Washington and W. James of Cambridge, vice-presidents of the English society, form an advisory board in America, but apart from their advisory functions there is no "organization" here, a circumstance which will doubtless contribute to economy and efficiency of work.

A NEW CEMENT.—Prof. Alex. Winchell claims to have a cement that will stick to anything. The recipe is as follows: Take 2 ounces of clear gum arabic, $\frac{1}{3}$ ounces of fine starch, and half an ounce of white sugar. Pulverize the gum arabic and dissolve it in as much water as the laundress would use for the quantity of starch indicated. Dissolve the starch and sugar in the gum solution. Then cook the mixture in a vessel suspended in boiling water, until the starch becomes clear. The cement should be as thick as tar, and kept so. It can be kept from spoiling by dropping in a lump of gum camphor or a little oil of cloves or sassafras. This cement is very strong indeed, and will stick perfectly to glazed surfaces, and is good to repair broken rocks, minerals or fossils.

THE IVORY SUPPLY.—One of the results of the development of Africa will be the increase in the supply of ivory. The annual slaughter of the elephant on that continent at present reaches 65,000. The ivory product is worth \$850,000. With the influx of European capital and enterprise, it is to be supposed that the elephant will be exterminated, as has been our American buffalo here.

THE HUMAN BODY AN ELECTRIC BATTERY.—The French Academy of Science has discovered by experiment that each human body is in itself an electric battery, one electrode being represented by the head and the other by the feet. Therefore it is the thing to sleep with one's head to the north and feet to the south.

GOOD HEALTH.

State Health Report.

The monthly report of the State Board of Health is before us. Its chief feature is Dr. Tyrrall's report on the prevailing epidemic. The report says that influenza, epidemic catarrh or la grippe has prevailed extensively throughout the State from San Diego to Siskiyou.

Reports of a large number of physicians from the interior are given. Dr. Tully, in a letter from Sierra City, says that it is there characterized by its tendency to attack the bronchial tubes and the substance of the lungs, but so far no deaths have occurred from it.

The majority of localities report the disease in a mild form and without fatality. Its mode of attack differs in many particulars. It may manifest itself by sneezing, headache, chilliness, cough, sore throat, carache, vomiting or diarrhea or constipation, fever, dizziness, pain in the limbs or nervous twitching; but none of these symptoms are constant. Heaviness over the eyes, redness of the eye-balls, intense pain in the back, in the limbs and through the muscles, with a feeling of constriction around the throat or chest, are the commonest symptoms observed in la grippe.

Its chief characteristic is, however, the extreme debility and prostration which accompanies its advent. This, with intense mental depression and profuse sweating, protracts the convalescence much longer than it might be supposed; and although the fever, headache and muscular pains last but a few days under proper medical treatment, the heart depression, muscular weakness and nervous debility take some time to overcome.

As the onset of the disease is at present unknown, we can advise no means of prevention, but would recommend that medical advice be sought in all cases, as those suffering from previous diseases or debilitated from any cause are very apt to succumb to a severe attack of la grippe, owing to the intense nervous prostration that ensues, and the tendency to heart failure that always accompanies the disease. Under proper stimulation this may be overcome, but to administer stimulants judiciously requires an educated judgment and a perfect comprehension of the object to be attained.

The average mortality is larger than usual, being at the annual rate of 20.64 per 1000—the largest for many years.

This increased mortality is not so much due to the prevailing epidemic as to a mysterious pandemic influence which renders the human system particularly liable to pulmonary disorders, and particularly fatal to those whose lungs are already diseased or which take on acute inflammation. We find, for instance, that during the month of January consumption was fatal in 270 instances. This is double the usual monthly mortality from this disease, and exemplifies the depressing influence of the epidemic catarrh which is now passing over the State.

Pneumonia caused no less than 228 deaths, which is more than double the monthly mortality.

Bronchitis is credited with 57 deaths, which is also a large increase over former reports.

Congestion of the lungs caused 27 deaths, which is likewise in marked excess of the usual fatality.

Diphtheria and croup caused 40 deaths—a slight increase over the report for December.

Reports received from 93 different localities in the State indicate an extremely limited prevalence of zymotic diseases, such as diphtheria, scarlet fever, measles, typhoid and kindred specific affections, those mentioned being few in number and sporadic in character, whereas diseases of the respiratory organs, dependent in some measure upon meteorological conditions, exhibit a frequency and fatality which is phenomenal in this State. That this is owing to the great pandemic wave of epidemic catarrh which is now spreading all over the State, rendering the populace more susceptible to inflammatory affections of the lungs, may be accepted as the probable explanation of the unusual frequency of the respiratory diseases which have prevailed during the past month. Those suffering from consumption were affected in a remarkable degree, prostration being the most noticeable symptom, and this often so severe that death ensued in a few days.

TEA-DRINKING AND LA GRIPPE.—The French soldiers have been an army of tea-drinkers during the prevalence of la grippe. Whenever la grippe made its appearance in a regiment, all the soldiers who remained free from the epidemic were given between meals hot tea with sugar.

OLD MINE TIMBERS.—Much timber from the old workings of the mines is now used for fuel for the boilers, and recently an assay was made of some of the ashes by Charley Harper, foreman of the Con. Virginia. He found that they went \$40 a ton, and immediately dumped a pile containing about 20 tons into the ore-bins. The old timber, very much of which is compressed by the immense weight it has sustained, has during its years of silent strain absorbed from its surroundings the precious metal in quantities sufficient to make it about the highest grade fuel ever used.—*Virginia Enterprise.*

USEFUL INFORMATION.

A NEW RED GLASS has been recently invented in Germany, and appears to be attracting a good deal of attention. Besides its use for the manufacture of bottles, goblets and vases of various kinds, it will be found applicable in photography and in chemists' and opticians' laboratories. This glass is produced by melting in an open crucible the following ingredients: Fine sand, 2000 parts; red oxide of lead (minium), 400; carbonate of potash, 600; lime, 100; phosphate of lime, 20; cream of tartar, 20; borax, 20; red oxide of copper (protoxide), 9; and binoxide of tin, 13 parts. By a single melting a transparent red glass is thus obtained of a very fine quality, of which various objects can be manufactured directly, without it being necessary to submit the glass to a second heating with the view of intensifying the color.

UNBREAKABLE GLASS.—We find in an Eastern exchange the following account of the manufacture of a substitute for glass that should meet with a wide popularity for many purposes where obscured ground or cathedral glass is now used. An unbreakable substitute for glass is made by Mons. L. C. A. Marguerie of Paris, by immersing gauze in a heated state in a thin paste formed of soluble glass, gelatine and glycerine, or glucose, in proportions varying according to the use for which the material was designed. When nearly dry, the sheets are dipped in a concentrated solution of chrome alum or bichromate of potash. Any desired coloring matter may be incorporated with the gelatine, and opal or other protective varnish may be applied to the "vitro-metallic" panes.

PAPER FOR PILLOWS.—All England is just now crazy on the subject of paper pillows. You tear the paper into very small pieces, not bigger than your finger-nail, and then put them into a pillow-sack of drilling or light ticking. They are very cool for hot climates, and much superior to feather pillows. The newspapers are printing appeals for them for hospitals. Newspaper is not nice for use, as there is a disagreeable odor from printer's ink; but brown or white paper and old envelopes are the best. As you tear them, stuff them into an old pillow-case, and you can see when you get enough. The easiest way is to tear or cut the paper in strips about half an inch wide, and then tear or cut across. The finer it is the lighter it makes the pillows.

MUSICAL GAS MACHINE.—A musical gas machine, called the pyrophone, has been brought out in England. Its compass is three octaves, and it has a keyboard and is played in the same manner as an organ. It has 37 glass tubes, in which a like number of gas-jets burn. These jets placed in a circle, contract and expand. When the small burners separate, the sound is produced; when they close together, the sound ceases. The tone depends on the number of burners and the size of the tubes in which they burn, so that by a careful arrangement and selection, all the notes of the musical scale may be produced in several octaves. Some of the glass tubes in which the jets burn are nearly 11 feet long.

WOOD PULP IN MORTAR.—Wood pulp is now being used as the basis of a plastic compound to serve as a substitute for lime mortar in covering and finishing walls. It is designed to possess in addition to all the desirable qualities of ordinary mortar, the characteristics of being harder, and, when applied to woodwork in a thin coat, rendering it both fire and water-proof.—*Timberman.*

PATENTS.—Last year 20,420 patents were issued in the United States, against 9779 in England and 3921 in Germany.

ELECTRICITY.

DON'T TOUCH AN ELECTRIC WIRE WHEN IT IS ON THE GROUND.—One of the chief causes of accidents from electric wires arises from the ignorance of most people with regard to the circumstances under which the wires are dangerous. The nature of such wires and the circumstances under which danger may be feared should be taught in every school in the Union, and one of the things which should be first and persistently taught is never to lift a wire off the ground, or ever touch a wire anywhere. As long as it is on the ground it is harmless, no matter what pressure may be on it. The moment it leaves the ground it may be dangerous. If it is in the way of traffic you can safely pull it across the street with your foot, then put your foot on it and hold it on the ground and it cannot hurt you; but do not lift it. Never touch a wire tied on a pole. It may not be dangerous, but it is like the unloaded gun—it may kill you.

HOW TO MAKE A STORAGE BATTERY.—A simple and effective storage battery may be made as follows: Get two half-round porous cups and a round glass jar large enough for the two porous cups to stand in upright. Get two plates of sheet lead one-sixteenth of an inch thick, wide enough to fit the half-round side of the porous cups and deep enough to come an inch or so above the top edge of the cups and

jar. Solder a stout copper wire or a screw post to each lead plate at the top. Place the lead plates in the cups and fill the cups nearly full with a paste made of red lead mixed with a solution of sulphate of soda thin enough to run like a cement. The glass jar containing the two cups should be filled to within half an inch of top of cups with sulphuric acid and water, about one part of acid to eight parts of water. One plate should be marked X, so that in charging, the current will be correctly connected. This may be charged by attaching to a series of a dozen enlithate of copper cells for 24 hours or from a dynamo. It should always be charged in same direction, and it will improve by repeated chargings. A wooden cover may be fitted to the glass jar, and evaporation of the fluid should be replenished by adding water. Two or more cells of this battery will work small motors, lamps and induction coils, and if thoroughly charged, will retain a large volume of electricity for considerable time. After once being well charged, four to six cells of sulphate battery will recharge it.

ELECTRIC LAWS AND SNOW.—The last snow-storm in Boston afforded an opportunity for the practical demonstration of the utility of the new electrical sweeper for street-car tracks. It did its work rapidly and well, the only apparent drawback being the fright with which it inspired horses. This was common with car-horses as well as those attached to private vehicles, and will doubtless wear away as did the equine surmise at the sight of the electric cars. The new sweeper leaves the snow just outside the rails, and gathers no accumulation to form into slush for the discomfiture of pedestrians. The electric cars all made good time, being delayed only by horse-cars.

SOLDERING BY ELECTRICITY.—A late invention of Chas. E. Carpenter, a Minneapolis electrician, is an electrical soldering rod, which, he claims, entirely does away with the many annoyances attending that tool at the present day. One advantage is that it can be made much shorter without the heat being felt by those who handle it. Another advantage is that it never cools off unless the connection is broken. It is intended for use in large tin-smith shops, where many are constantly employed.

AN ELECTRIC STAMP to control the payments in banks, hotels and other business places has been invented. It works automatically and is said to be a good detective and preventive of mistakes.

THE ELECTRIC LIGHTS have reduced the average time of vessels passing through the Suez Canal from 37 hours 57 minutes to 22 hours 32 minutes.

DRILLING BY ELECTRICITY is said to be a great economy over the ordinary use of compressed air for such a purpose.

THE BUILDER.

Changes in Building.

Even the most casual observer must have noticed the changes which have been going on for several years in the choice of building materials and in the methods of construction adopted, especially in metropolitan edifices, both for business and residence purposes. Wooden timber, and brick and stone veneering have largely fallen into disrepute, and iron, steel, granite, marble and terra cotta have usurped their places. The modest five and six-story business block has given place to that of 12 or 14 stories high, and men and women now do business, as Shakespeare said, "between heaven and earth," suspended in elevators, or making fortunes, in departments the windows of which overlook the entire city. This may be called having "a splendid outlook."

But the transformation in building has by no means been confined to office structures. The modern dwelling no more resembles the old-fashioned home than the "Tacoma" does the country store at the "corners." The interior as well as the exterior characteristics have been changed. The new has "rung out" the old, and the difference is immense, as to comfort, convenience and elegance—not forgetting the increased expense, which is an important element in the erection of palatial homes.

It is not of these, however, that we would write. There are houses needed for the workmen and for salaried residents. For these there is the choice (in suburban towns) of wooden materials, sheathed with wood and plastered inside and out, or covered with corrugated iron, sheet iron, or metallic shingles, and brick and mortar. Cunningly devised shapes of houses are popular, and too often too expensive for the man of moderate means; but almost any house-holder can afford to erect a "balloon frame," sheath it with boards, and cover them, roof and all, with the cheaper grades of sheet iron, which, when nicely painted, will resist the weather and secure dryness and comfort, especially if properly hoarded and plastered inside.

For external ornamentation the outer covering of sheet iron may be diversified with a tasteful arrangement of metallic shingles in fancy forms and painted in various colors.

THE SLIDING DOOR NOT KNOWN IN EUROPE.—It will be news to most American readers that the sliding door, which is now so common and

so convenient a feature of dwelling-house interiors in this country, is as yet a novelty in the Old World. We have it on the authority of an English paper, however, that such is the case. But the journal referred to (*Invention*, London) has at least a correct understanding of the manner in which the modern sliding door is constructed and placed. It is enabled thereby to point out the singular and rather amusing error into which a French writer on dwelling-house architecture has fallen, who says of the American sliding door that "if it could be arranged to slide in the thickness of the wall, instead of outside, it would be perfect, but perhaps this may come in due time." This French commentator must have derived his impressions from some American hook of house plans of extremely ancient date. We have examined the oldest one in our possession, and it gives no hint to so crude a device as a sliding door which slides "outside the wall." If they would always slide with the unobtrusive smoothness rightfully to be expected of them, they might indeed be said to defy criticism.—*Mechanical News.*

HEIGHT AND PROPORTION OF FACTORY CHIMNEYS.—A foreign contemporary calls attention to the fact that the rearing of high chimney shafts in connection with factories, chemical works, etc., constitutes a specialty in building construction, and may fairly be considered as a matter of very considerable economic importance. It is considered a question whether decrease in height of such chimneys may not effect a saving in fuel without impairing general efficiency. Herr P. Huth records a case in which the erection of a new boiler necessitated (after an unsuccessful attempt to raise it) the demolition of the old chimney, the dimensions of which were: Height, 65.61 feet; lower diameter, 19.68 inches; diameter of interior of chimney, 13.78 inches. The entire length of the draught, including the flue, was about 98.42 feet. For experimental purposes, a trial was made of heating the boiler when the chimney was 39.37 feet in height. Although the results were affected by the damp masonry, there was a distinct improvement perceptible as compared with the old chimney. At a height of 45.93 feet the trials were still more satisfactory, and at 52.49 feet, all requirements were completely fulfilled, the smoke being absolutely white and sometimes scarcely noticeable, without any soot or flying ash. The heating of the boiler was excellent, and the consumption of coal 15 to 20 per cent less than was the case with the old chimney. The chimney was then finished in the usual way, without any further improvement or addition to the height. From these facts Herr Huth deduces the fact that not only the height, but also the diameter of a chimney in proportion to its height, demand attention for economic and administrative reasons. High chimneys are, he considers, as a rule, too narrow in proportion to their height, and hence do not draw well, or else waste fuel and cover the neighborhood with soot and flying ash. The effort to remedy these evils by still further increasing the height of chimneys leads to their aggravation.

Postal Telegraphy.

The Postmaster-General appeared before the House Committee on Postoffices and Post Roads on the 11th and discussed the proposition for the establishment by the Government of a limited postal telegraph. He submitted a plan providing for a lease of the wires by the Government for ten years for carrying on the business, and for the delivery of telegrams by carriers in the first delivery following the receipt of telegram.

The scheme, he insisted, was practical and free from objections. He proposed the union of the post and telegraph on a basis that would not interfere to any appreciable extent with existing rights, but would offer an incalculable service to classes not now enjoying the use of the telegraph to any large degree. He asked that he be directed to negotiate for and secure a set of leased wires such as the great newspapers have from city to city, or the brokers and bankers have connecting their offices and different cities, that the public might communicate through their business offices (postoffices) from city to city, or by messages dropped in their mail-boxes. The people had now, he continued, business officers and clerks who could soon learn the tick of machines, carriers who traveled over the same streets traversed by telegraph boys, and stamps for payment, that dispense with bookkeeping, and all that was needed to build up the service was the authority and the wire. He declared emphatically that such a service was the legitimate work of the postoffice, and the people were right in stoutly demanding telegraph facilities at postal stations. Nothing in the proposed bill is to be so construed as to prohibit any telegraph company from performing general business for the public as the same is now done.

Postal telegraph charges in any one State shall not exceed 10 cents for messages of 20 words or less, counting address and signatures, nor over 25 cents for any distance under 1500 miles, nor over 50 cents for any greater distance; rates and rules and regulations to be prescribed by the Postmaster-General. The bill also provides for the establishment of a system of postal telegraph money orders, at a rate not to exceed double the rate now charged, in addition to the double postal telegraph charge.

TABLE OF CONTENTS.

EDITORIALS.—Mining Ditches; Granite Quarries, Passing Events; Banks and Mining Stocks; Chinese Gold Mines; True Lead Ores; The Late Thomas Varney; 134; Reopening a Caved Mine; Hydraulic Slides; The Debris Commission, 135.

ILLUSTRATIONS.—Mining Ditches; View in Granite Quarry, 127; Henry M. Stanley, the African Explorer, 129; Plan and Sections of the Tilly Foster Mine, 135.

CORRESPONDENCE.—The Mines of Rocky Bar, Idaho; River-Bank Cutting—Its Causes and Prevention; Balls of Fire, 128; Californians on the Atlantic, 129.

MISCELLANEOUS.—Henry M. Stanley, 129; Old Mine Timbers; Postal Telegraphy, 133.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 130-131.

MECHANICAL PROGRESS.—Electric Welding; Wear of Tires; A Marine Engine with Eight Cylinders; Flexible Pittman; Edison as a Thinker; A Steel Polish on Iron; A Machine Chisel; Miscellaneous, 132.

SCIENTIFIC PROGRESS.—Researches in Magnetism; Iron ships and Lightning; Philosophy of the Effect of Oil on Waves; Some Experiences with Zinc; Insects in Drugs; Psychological research; A New Cement; The Ivory Supply; The Human Body an Electric Battery, 132.

GOOD HEALTH.—State Health Report; Tea-Drinking and La Grippe, 133.

USEFUL INFORMATION.—Unbreakable Glass; Paper for Pillows; Musical Gas Machine; Wood Pulp in Mortar; Patents; Miscellaneous, 133.

ELECTRICITY.—Don't Touch an Electric Wire When it is on the Ground; How to Make a Storage Battery; Electric Cars and Snow; Soldering by Electricity; Miscellaneous, 133.

THE BUILDER.—Changes in Building; The Sliding Door not Known in Europe; Height and Proportion of Factory Chimneys, 133.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 141.

Passing Events.

We have had another stormy week in California, and again have the trains over the Sierras been blockaded by the snow. Plows and men are working night and day to keep the railroads open, but as one storm succeeds another, the difficulties are gradually increasing.

At Grass Valley the ditches are choked by snow, stopping work at many of the mines. As the mines have now great quantities of water to contend with, the failure of power is very bad.

Already this season the bodies of several miners have been found in their cabins, where they perished from cold or lack of supplies. It is feared that many other prospectors and miners, scattered through lonely places in the mountains, are now suffering.

The strike in the Keystone, reported this week, brings renewed faith in that famous old mine. It was thought to be pretty well worked out, but present prospects indicate to the contrary.

A VERY rich strike in quartz has been made in the Texas and Georgia mine, Old Diggings district, by Hart & Fleming at a depth of 500 feet. This is the deepest find in Shasta county. The rock is said to be rich beyond belief.

Banks and Mining Stocks.

The Nevada bank of this city is to be reorganized, with I. W. Hellman of Los Angeles as president, and that gentleman is reported as saying that he has never in his life speculated in mining stock, and he proposes to keep an argus eye on the Nevada's funds, and that not one cent is to be loaned on this class of security.

This bank was established with money obtained from mining operations—both mining stocks and mines. Its entire capital came out of the Comstock bonanzas. Two of the founders are dead, and the other two are engaged in other operations which occupy all their time. Therefore they retire and give place to new directors and officers who have no sympathy with mining matters.

It seems to us that the members of the Stock Board are themselves mainly to blame for the resolution of the new officers of this bank to refuse loaning on mining stocks. The bank itself in its palmy days must have made money out of its stock operations; it was when it started in on wheat that financial loss and loss of prestige came. This simply shows that mining stocks are not the only outlets for speculation where there is chance for loss.

But the fact is that loans on mining stocks have for a long time been made by the banks more on the commercial standing of the firms or men asking for such loans than on the market value of the "securities." The stocks themselves are not looked on with the former favor. But it is pretty certain that had the Stock Exchange exercised more judgment in its listing of mines this state of affairs would have in a measure been prevented. All sorts of "wildcat" stocks have been put before the public on the same basis as meritorious ones, as far as the Exchange was concerned. That is, the public could see no difference as these stocks were called, bid upon, bought and sold. Being always in the company of thieves, the honest ones were naturally suspected, until all are now looked upon with doubt, and the mining-stock business has gone to a low ebb. Of course, we understand very well that the brokers themselves, or the Board itself, probably had no direct interest in the "wildcats" and paper mines, but their official recognition of them has resulted in deception of the public.

The very natural result has been that the whole business has become one of speculation. As originally devised, the plan was to obtain capital to open, develop and work mines, but it turned into a means of opening, developing and working pockets—not mines' pockets, but men's pockets. True, there were times when the simple mining itself paid well, and in a few instances it does still, but the greater number of the mines dealt in have never been profitable as mining operations purely.

By some prudent care and forethought, the Board lists would have been weeded of the worthless securities which have injured all. Could people know that the Board put its stamp of approval only on properties that had some merit—present or prospective—there would be no difficulty in obtaining money on the stock itself, without the "personal equation" being considered. But the reverse is the case; and now the new president of a great bank that was founded on mines, comes out plainly and says the institution will have nothing whatever to do with mining stocks.

Chinese Gold Mines.

We have before mentioned the gold mines in the Gold Ox mountain, province of Shantung, China. A ten-stamp mill was sent there from this city a few years ago, but now the mines are to be opened on a larger scale than so small a mill warrants. Two Chinamen came over here a short time since and are reported to have sold more or less stock in the company to Chinese merchants in San Francisco. It is also reported that they have ordered a 300-stamp mill of Fraser & Chalmers of Chicago, giving out that they could not get as large a mill as they wanted in this city. This of course is absurd, for the Alaska mill of 240 stamps was built here, and they could have 2400 stamps if they wanted to pay for it. Stamp-mills are built in groups of five stamps each. However, Fraser & Chalmers can build them a good mill and as big a one as they want.

Mr. J. R. Sara of Oakland was one of the experts employed by the Chinese to report on

their mines. He was there in 1888, and says that the mines are in a granite formation, with quartz croppings from 25 to 50 feet in height, 30 to 110 feet thick, and 12 miles long. The average assay of the ore in sight over the entire length of the formation was from \$15 to \$20 per ton free gold. There is an abundance of water at the mines, and fuel can be brought very cheaply by boat from the coal mines of Kai Ping, about 350 miles distant.

The same company that is going to develop these mines has for several years been working mines at Pingtu, in the same province, about 150 miles southwest of Chefoo. They had a 20-stamp mill and a complete California plant, the timber and materials for which were obtained chiefly from the United States. At one time there were ten California miners employed at the Pingtu mine.

No foreigners are permitted to work mines in China or to have any interest in the development of mines, but experts are given good salaries, and the pay is sure. The mandarin in charge of the great project at Gold Ox Mountain is Li Chung Tai, a relative of the Viceroy. The superintendent of the mines is C. E. Taylor, formerly of Fresno county, California, who has been in the employ of the company about three years. The placer mines so far discovered are not rich, and the Chinese who work in the gulches and along the streams near the great ledge of Gold Ox Mountain are content to pan from two hits to half a dollar per day.

Free Lead Ores.

A dispatch from Kansas City says: The city is becoming agitated over the effort of Colorado and Utah miners and smelters who are trying to defeat the free silver-lead ore provision in the reciprocity treaty now pending between the United States and Mexico. It would be a great blow at the smelting industry in Kansas and Kansas trade with Mexico. The largest smelter in the United States is at Argentine and another is building at Lovelace. The defeat of the free-ore provision would shut out the importations of Mexican flux ore and badly cripple, if not destroy, the smelting industry at this point. The Argentine smelter treats two-thirds of the importation of Mexican silver-lead ore, some \$4,000,000 annually. The Board of Trade of this city adopted resolutions asking that the treaty provide for free lead ores. The press will speak in favor of free ore. It is believed that with free Mexican ore this will become the largest smelting center in the world.

All this sounds very well for Kansas, but how about Colorado, Utah, Idaho, Montana and Nevada? What is to become of their mines and miners if this ore continues to come in free? Are these hundreds of mines and thousands of miners to be sacrificed for the sake of building up two or three smelting companies in Kansas? These companies in Kansas and elsewhere are beginning now to show their hands. It has been due to their efforts that the free ore fraud has gone on so long. The smelting enterprises have been wonderfully profitable to the few who own them, but it is time they should give some one else a chance. The thousands of lead miners should be considered before the few hundred smelting capitalists. But the lead miners are organized to fight for their rights, and the smelting men no longer have it all their own way.

If this free ore shipment keeps on, all the lead mines in this country will have to close down, for they cannot compete with the cheap labor of Mexican people. But the owners of the big smelters, as long as they can make money, care nothing at all about our miners, and would prefer to see the Mexican mines worked rather than our own. Such selfish feelings, however, should be promptly rebuked by Congress immediately preventing the further importation of lead ores without payment of duty.

Kindly Remit.

For two months past our agents have been able to do but little service for this paper. Many of our old subscribers seem to have been so completely housed up as not to remit their renewal of subscriptions promptly. With the large expenses we are constantly under for furnishing so valuable and straightforward a journal, we need early payment from all who are in arrears on our list, and will much appreciate all remittances at this time from old and new subscribers.

The Late Thomas Varney.

The death of Thomas Varney of Oakland last week removes from the scene of his labor a man well known to the mining community of this coast since the days of 1849. As the inventor of the Varney amalgamating pan in early Comstock days, he achieved a reputation as an inventor and mechanic; but long before this his friends knew of his ingenuity and skill. At one time he made a complete piano with his own hands. For some time he had a place at the old Pacific Iron Works, where he used to amalgamate and treat lumps of ore for miners, and in this way became well known to the mining community. The constant handling of quicksilver at that time affected the nerves of his hands in a peculiar manner. Some of the features of the amalgamating pan which he invented are incorporated in the present "combination pan" in universal use in silver-mills in this country.

Mr. Varney was one of the first in this country to recognize the merits of nitro-glycerine compounds as blasting agents. He made many experiments with various substances as absorbent of nitro-glycerine, but Nobel's discovery set aside the results of that work. It was, however, due to Mr. Varney that the Giant Powder Co. was formed. He had little means at that time, but his zeal and influence interested Mr. Judson and others who put money into the manufacture of this substance. Mr. Varney afterward went East in connection with the business of making giant powder. He was a director of the company at the time of his death, and also president of the Kennedy Mining Co.

Mr. Varney was always a very active man, and accumulated a handsome fortune, leaving property valued at almost \$1,000,000. He was of sterling character, upright and honest in all his dealings, and popular with all who knew him. Mr. Varney was connected with many mining enterprises in this State and Nevada, at various times, but was always more interested in metallurgical than mining operations. He had a thorough knowledge of the amalgamation of ores, both in theory and practice. Mr. Varney was 71 years of age. He was of fine physique and appearance, and an able and good man in every way.

The Mechanics' Institute.

There is opposition to the regular nominees of the Mechanics' Institute this year, and quite an active little fight is being made. The opposition on Members' ticket is as follows: Chas. L. Taylor, president San Insurance Company; Henry Root, civil engineer; Dr. Benjamin Marshall, physician; A. P. Flaglor, photographer; W. A. Batty, lawyer; Jas. H. Barry, publisher and printer; Chas. Elliot, civil engineer.

The original cause of the opposition is the plan proposed by the present Board of Trustees of putting up a pavilion on the Folsom-street property, and, in place of the present structure on Larkin street, to erect a costly building for a library and renting purposes. To carry out this plan, they must sell the Post-street property and meet the balance required by creating a bonded debt of between one and two millions.

To this plan many object, and the "Members' Ticket" nominees are pledged to the following:

To continue the holding of fairs in the Pavilion on Larkin street until it becomes necessary to replace the same by a more permanent structure for fairs and library purposes.

To sell the Folsom-street property at the earliest favorable moment compatible with the interests of the institute.

To oppose the creation of a large bonded indebtedness for buildings or for speculation in real estate.

To relieve the institute of its present indebtedness as soon as possible, and carry out the objects for which it was organized.

To make such changes in the constitution and by-laws as will prevent quarterly meetings being made packed conventions at times of election.

To abolish the present practice of trustees making awards of prizes to violation of committee reports, which practice is productive of injustice and unfriendly feeling.

To prohibit trustees from making exhibits at fairs for competition.

To increase the supply of books in the library, and furnish greater accommodations for the chess and reading rooms and instruction classes.

MONTANA has more than 12,000 bona fide mining claims recorded. Development work on these claims ranges from \$100 up to a million. Extraordinary activity prevails in the mining industry of the State.

Reopening a Caved Mine.

In last week's PRESS, brief reference was made to the general method adopted for reopening the Tilly Foster iron mine, Putnam Co., N. Y. The plan was very bold in design, and was executed promptly. The mine was worked in a desultory way until the old system of mining could no longer be pursued. The old system consisted in sinking on the ore body from the surface to the 165 foot level, and leaving ore-pillars to support the hanging wall, the vein being over 100 feet wide at this level, and the overhang, in places, nearly 50 feet. When these pillars proved inadequate, and caves occurred, both ore and rock were removed from the pit and the ore assorted on the banks, precautions being taken to prevent, by the erection of dry masonry and cement walls, the spread of these caves at the ends of the pit.

Mr. F. H. McDowell of New York described before the American Institute of Mining Engineers the method by which the mine was reopened, stating that the credit for bringing the operation to success was due to E. S. Moffat, general manager, and Clinton Stephens, contractor.

After the pit was exhausted, new workings were opened below the 165-foot level by means of inclines sunk on the footwall, which has a slope of about 66°. Stations were cut and drifts were run right and left along the footwall at every 100 feet in depth, and crosscuts were made to the hanging-wall, with upraises into chambers, 20 feet wide, leaving pillars 20 feet thick and floors from 15 to 25 feet thick. Then an effort was made to rob the mine of its pillars, first, by springing brick arches at the south end from foot to hanging-wall, to take the place of the pillars, and later, by drawing the ore from the chambers after caves had been developed in both floors and pillars. These

from a vertical position to an inclination of one foot horizontal in six feet vertical.

No difficulty has been experienced in securing good strong natural walls. To remove the ore from the pit, at the surface, steam derricks are used, and across the cut cables are stretched. On each cable is a trolley moved back and forth by a traveling rope. The car bodies are lifted from the trucks and lowered to the pit, exchanged for loaded ones, which are hoisted to

charged to cover the stripping and incidental expenses.

Hydraulicking Slides.

At Tunnel No. 9, near Delta, Shasta Co., on the Oregon line of railroad, they have had a great deal of trouble this winter. The landslides have been of large extent, and hundreds of men have been for weeks trying to clear the

that ordinary hydraulic mines use, but there is little doubt that they can wash away the loose earth faster than they could shovel it.

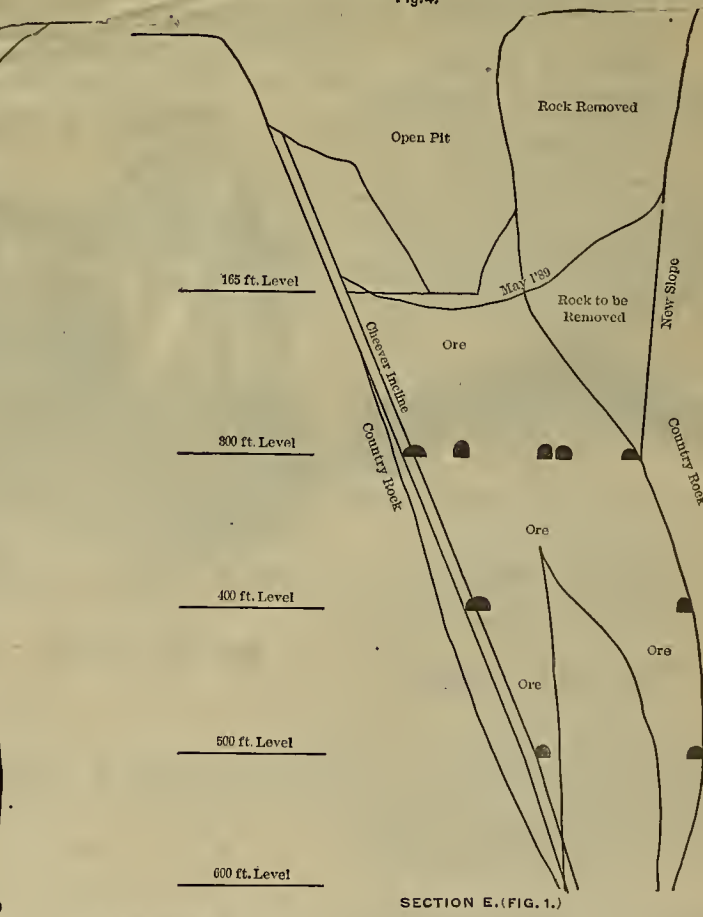

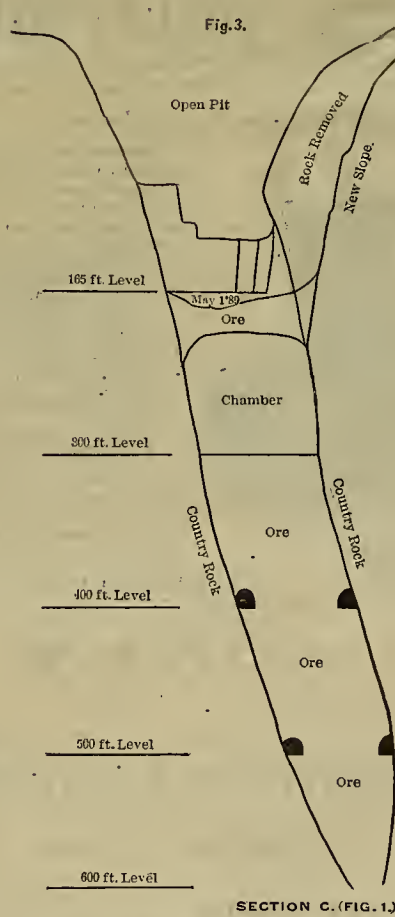

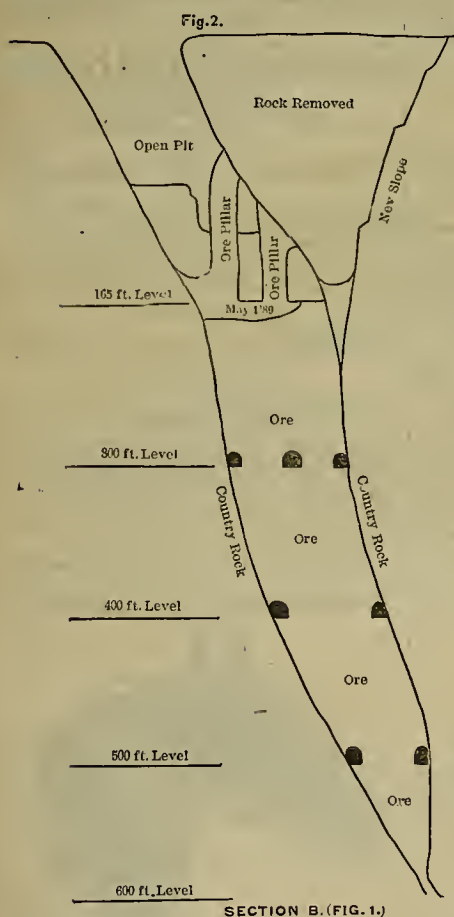

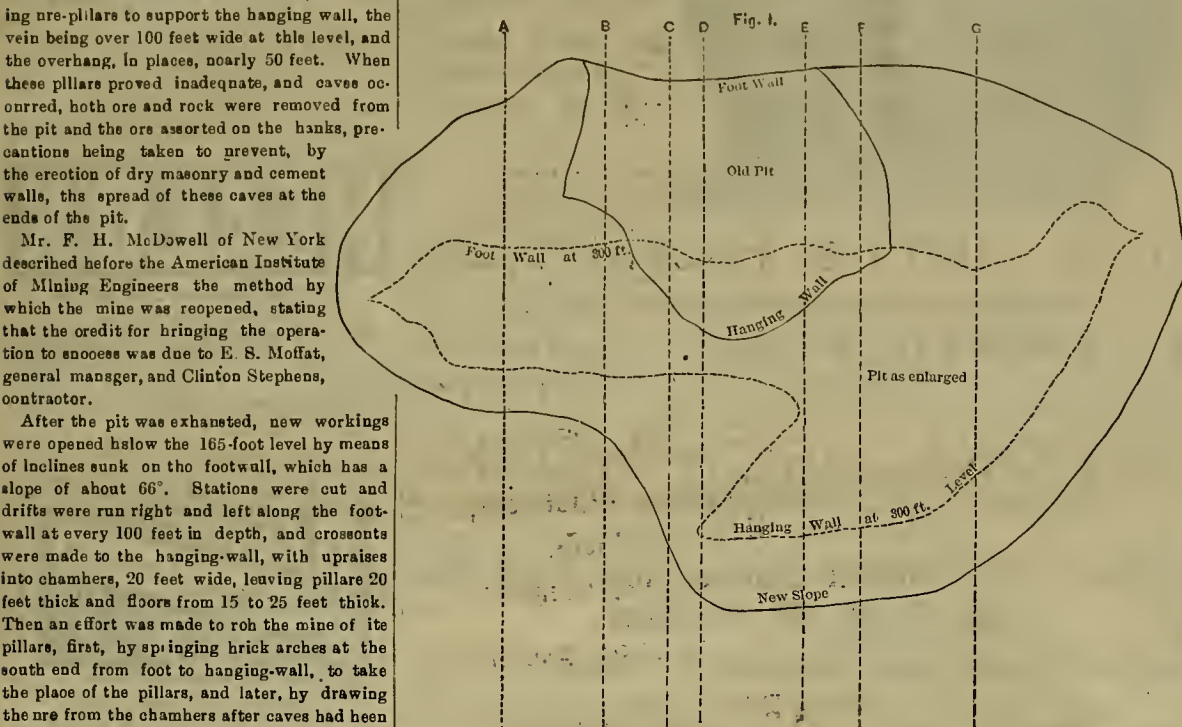

The hydraulic process was used in railroading several years ago on the C. P. at Towles. A big slide of wet, heavy clay which could not be handled by shovels came across the track. The Towles Bros. ran some pipes to the spot and the slide was quickly hydraulicked off.

The Debris Commission.

The U. S. Debris Commissioners have been misquoted in the statements that they are about ready to file their report. One of the Commissioners told the editor of the MINING AND SCIENTIFIC PRESS recently that the report would not be ready before the end of the year. What this report will be of course no one knows, probably not even the Commissioners themselves as yet. Still, as these gentlemen are engineers with no prejudices for or against the conflicting industries, they will look upon the subject from an engineering point of view. This being the case, they can scarcely report that debris cannot be held by dams when they have personally seen great beds of debris behind such dams as have been already built by the miners. The contrary statements of interested and inexperienced persons will hardly be considered of much importance in view of these facts.

Should these Commissioners report that the heavier debris can be impounded and thus be prevented from injuring the rivers, the question of the "riling" of the waters by the lighter material will then be considered. As cultivating the soil, the cutting away of wood and brush, and the tramping of stock all confessedly have their influences also in the muddying of the waters of the rivers, one party to the contest may be held responsible with the other in this regard.

If these engineers are fully convinced, and so report, that the hydraulic mines can be oper-

PLAN AND SECTIONS OF THE TILLY FOSTER MINE.

efforts failed, as did, in turn, every other scheme devised for the extraction of the reserves. The situation called for heroic measures; and the plan finally adopted necessitated the handling of over 500,000 tons of rock, with the expenditure of more than \$250,000.

Fig. 1 is a plan, and Figs. 2, 3 and 4 are sections selected from fifty taken 100 feet apart throughout the length of the deposit. It will be seen that the scheme adopted necessarily involved stripping to the 165-foot level at all points. In some parts of the mine the stripping was even deeper. The new hanging-wall varies

the surface, lowered on the trucks and run out to the dumps. They handle 1000 tons in 10 hours. An engraving showing this method of working was given in the PRESS Nov. 23, 1889, page 391. The shipping ore is now mined by the contractors for from 85 cents to \$1 per ton, the lean ore being delivered to the dump at rock prices, which are from \$1.15 to \$1.45 per cubic yard, according to the level hoisted from.

The undertaking has been based upon the expected recovery of 600,000 tons of shipping ore, against which a royalty of \$1 per ton is

track. Just about the time they had removed the great mass of earth, the rains brought down another slide about as big as the first one. It was then determined to try sluicing the small mountain of earth away by the hydraulic mining process. A complete hydraulic outfit was secured here, and assistant general manager Curtis went up with it. There is no convenient elevated water supply to which pipes can be laid to use the force of gravity, and so a powerful pump will be set up by the river close by to force the stream from the giant nozzle. Of course they cannot get the force this way

ated, with suitable restrictions, and by providing suitable settling reservoirs, they will, doubtless, point out the proper methods of constructing such reservoirs, and possibly the respective places where they should be built, in the case of large mines. Should this be the result, the farmers in the regions affected can scarcely have further cause of complaint, since it is certain that the suggested restrictions would be enforced. In fact, the miners themselves would be glad to take any steps which would permit them to work in such a way as not to interfere with the business of others.

Academy of Sciences.

At the regular meeting of the California Academy of Sciences on Monday evening, Dr. Harkness presided.

T. H. Vail and J. S. Bunnell were elected members of the society, and C. H. Engenmann and Charles Fuchs were proposed for membership. The accessions to the museum were: A collection of fungi from Carl Precht; specimen of *Amblystoma macrodactylum*, donated by Dr. Toland; four shells from Lower California, by T. S. Budgee; insects from Durango, Mex., by C. A. Hamilton, through H. S. Durden; three specimens of *Salmonella* and one abnormal head of a salmon, by Charles H. Ohm; one fossil molar of *Elephas primigenius* from Alameda, by J. L. O. Hamilton.

A paper was read by Dr. H. H. Behr on the genus *Amblystoma* and its allies (salamander, menopoma, water-dog, axolotl), and was illustrated by a rare specimen from the alkaline waters of Medicine lake, Wash., presented by Dr. Toland. The marked discrepancy in the external appearance of the young of animals of this class from the adult ones started a discussion on an analogous discrepancy between the young and adult salmon. In the discussion which followed, Dr. Behr stated that the difference between salmon and trout consisted, in one particular, in that the salmon leads a marine life and spawns in fresh-water streams during the months after Christmas, while the trout, living and spawning in fresh water and only exceptionally entering the sea, has its spawning season before Christmas. This statement was endorsed by Prof. Townsend of the Fish Commission steamer Albatross, who added an interesting observation in regard to the tenacity of life in *Menopoma*, an animal related to *Amblystoma*.

Capt. I. N. Thayer read a paper on modern shipbuilding and the increase of oil-tank steamers.

MARSHUTZ & CANTRELL.

The Patentee and manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Manufacturers of

Sheet Iron and Steel PIPE!

ALL SIZES.

130 Beale Street, San Francisco, Cal

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimate given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

The Best Mining District

On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is
THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe. Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, \$6 00 a year; WEEKLY, \$2.50, in advance.

The Celebrated H. H. H Liniment.

The H. H. H. Liniment is for the treatment of the Aches and Pains of Humanity, as well as for the ailments of the beasts of the field. Testimonials from importers and breeders of blooded stock prove its wonderful curative properties. No man has ever used it for an ache or pain and been dissatisfied.
H. H. MOORE & SONS, Stockton, Cal., Proprietors.
FOR SALE BY ALL DRUGGISTS.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacketed Smelting Furnace (30"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 23, Elkhorn, Montana.

Washington's Birthday.

It is interesting to notice how much association has to do in giving fragrance to memory and imagination. When the old man goes back to the places of his childhood, he feels young again. No true American can visit the spot on the Lexington common "where the embattled farmers stood, and fired the shot heard round the world," or walk over the fields of Oamden, Monmouth or Yorktown, and not feel afresh the spirit of patriotism stir and thrill him. It is a breath of fresh air from the great mountains. The fact is, there is nothing in history that inspires like a noble personal example. Ideas must be embodied in order to live. This is why we are always looking about for some one a head taller than the rest that we may nominate as our leader in politics or religion. When we find him, we throw up our caps, beat the drum and kindle bonfires. We shall never get over our love of heroes, and hero-worship is a sort of religion. So from the north to the south, from the east to the west, in all towns, and villages, and cities, in schools and colleges, comes the spontaneous homage to that most perfect embodiment of our national ideal, the name of George Washington.

History, which chronicles the long struggle of the Colonies for liberty, records the eloquent words and noble deeds of many a statesman, patriot and warrior, but they all group themselves around this central figure. The history of Washington is familiar reading to every schoolboy, but as we go to press upon the eve of a national holiday, the anniversary of the birth of Washington, we cannot forbear to notice one or two salient points in his character, that should be held in lasting remembrance.

When the flush of feverish excitement, caused by the heroism of Bunker Hill and the Declaration of Independence had subsided, and the haggard face of war became more visible, Washington saw what no one else seems so clearly to have seen at that time, that the success of the Colonies did not depend upon grand strategy, brilliant movements, winning a battle now and then, but on the ability of the people to wear out the patience and exhaust the military resources of Great Britain by delay. This slow, conservative, Fabian policy, as it is called, required a master mind carefully to carry it through. The hope and confidence of the people is inclined to be fickle and can only be kept alive by dramatic movements and dazzling success. Hence the dashing Gates at Saratoga for awhile was the idol of the people. Even many in Congress clamored for his elevation to supreme command. Washington was too slow for them. How his faith and patience must have been taxed during that terrible winter at Valley Forge, or while retreating with his ragged, barefoot army across Jersey before the well-fed and warmly-clad soldiers of Lord Howe. The people were in despair and the soldiers were deserting. The army chest was empty; there was no commissary department. Many in Congress were plotting Washington's supersession. But through all this gloomy period, Washington was calm, serene, and never lost faith in the ultimate triumph of liberty. He paid no attention to the intrigues and slander of his enemies. He had no time nor disposition to counterplot. He trusted the cause. He trusted in the instincts of the people. He was the soul of the Revolution. His personal presence and magnetism was felt from the center to the circumference of the land, cast a ray of hope over all days of darkness, bolder the army and people intact by the majesty of his faith and example, till victory crowned the new-made flag at Yorktown.

We have always thought that the greatness of Washington most fully appeared after the war was over, when the country hung on the ragged and perilous edge of chaos and anarchy. Called to preside over a new Government, fill the office for the first time and put into motion a new piece of political machinery, and that at a time of general doubt and distrust, was a formidable task that may well have awed the stoniest heart. Washington satisfactorily accomplished the task for the reason that he had no sinister aims to secure, no pledges to redeem, no hungry partisans to feed, no enemies to punish. In the formation of his Cabinet, his nominations for the judiciary and all places of trust and profit, he looked over the whole field, sought for the best man irrespective of political opinions.

All we need to complete the glory and prosperity of this land is a revival of that sort of patriotism as characterized Washington, the man "first in war, first in peace, and first in the hearts of his countrymen."

SHOP NOTES.

Something Worth Careful Thought.

There is something worthy of interest and careful thought by every workman in every part of the country. It is a question which is just now greatly agitating the country in political circles; but it is one which is fast being taken out of politics and considered on its real merits. It is to the interest of every workman, and especially to every mechanic, that there should be a steady and the fullest possible demand for labor in every branch of industry. Such a condition can be brought about only by government protection to labor—a prevention of the importation of every article that can as well be made here, even at the cost of a small advance of price.

There is labor in every pound of iron, every yard of cloth, every bale of hemp, flax and wool imported from abroad, and to the extent of such importation is the demand for home labor reduced. Without a tariff the inevitable result will be that the standard of wages paid in this country must be lowered to somewhere near the level of wages paid abroad. This it must be, or no work at all upon such articles as foreigners are willing to make cheaper than we are now making them. Owners of factories, whose products are undersold by cheaper-made foreign products, will go out of business unless wages come down so as to enable them to successfully compete. In the event that they are forced to close, workmen now in their employ will have to look elsewhere for work, and, in getting it, will crowd all the harder the lists of those industries that may survive. This view has both experience and common sense for its support. No matter what free-trade theorists may say, there never has been, and never can be, found any other way of keeping out foreign goods to take the place of those produced by our own workmen except by that kind of protection which actually protects.

The Weight of Machine Tools.

A few years ago there was considerable argument in favor of largely increasing the weight of machine tools, but little seems to have come of this argument. It is safe to say that nine out of ten machine tools on the market to-day are lighter than they should be for the best economy, but builders will go on building light, weak tools, because they will sell. When it comes to putting \$50 more stock in a lathe, for example, the question of getting paid for the extra stock is, in these times of close competition, a very important one. When purchasers are willing to pay for heavy tools, they will find builders willing to make them. But the demand must precede the supply. When it comes to getting hard work out of a machine tool, 10 per cent extra cost does not amount to much, but when it is a question of selling a tool that costs ten per cent more than another, it is uphill business. The manufacturers of machine tools must look at the commercial side of the matter, to the exclusion of other considerations.

A bright manufacturer of machine tools, in England, said, not long since, to the writer: "You in America are neither better nor worse than we are in regard to strength of machine tools, except that I believe that just now we are moving faster in the direction of greater strength than you are." We cannot quote him literally, further, but his argument was to the effect that metal is removed slowly, in machine processes, mainly from the fact that machine tools lack "backbone." And looking at the matter fairly, he was right. His idea—and it is good—was that such tools should be made two or three times as heavy as at present, and that by such construction it would often be possible to double the speed with which work could be machined.—*American Machinist.*

A MACHINE SHOP - ELIXIR.

Wonderful accounts are related of the effect of the so-called "Elixir of Life" alleged to have been discovered by Dr. Brown-Sequard. There is probably a good deal of humbug connected with it, if, indeed, it is not all humbug. But what a great thing for some machine shops would be an elixir which could be injected into the oil-holes of decrepit drill-presses, consumptive lathes and rheumatic planers, and which would renew and revivify them, fill out their skeleton frames into some resemblance to modern proportions, and make them a little better able to compete with their younger rivals! And what a boon such an elixir would be to him who has been employed and placed in a responsible position, in the expectation, on both sides, that methods and processes were to be greatly improved and production cheapened, yet who finds it impossible to convince his employer that, in order to do this, some machines must go to the junk-shop or anvil and be replaced by others of more modern design and better fitted for competition.

ABOUT FLY WHEELS.

The mistake is often made of having a fly wheel too light for its work, says an exchange, and good regulation is almost impossible under such conditions, since when the speed of the fly wheel is reduced, the momentum is not proportionately less varying as the square of its revolutions. In finding

the weight of rim for a fly wheel a certain constant is used, some use 6,000,000, and others give greater weight and some less. The constant used is multiplied by the indicated horsepower and the product divided by the diameter of the wheel in feet times the square of number of revolutions per minute. The general practice is to use a lower constant than above, between 4,500,000 and 5,000,000.

SHAFTING.

Some are fond of turning down the end of a shaft whenever they wish to couple on to one that is of a smaller size, but this is not considered good practice, as it weakens the shaft too much; all the spring and bend comes in the weakest place, and this is found close up to the shoulder where the shaft generally breaks. Better turn a long, tapering neck, or use what is better, a reducing coupling bored out on purpose without the aid of a hushing. Unless every bearing is in line and on the same level, the shafting is being driven as if there was a break on one of the shaft pulleys; the more the bearings are out of true the more the break is at work resisting every effort to turn it, and constant care should be exercised in keeping the shafting straight while any portion of a mill is settling.—*Boston Journal of Commerce.*

AN INVENTOR'S REWARD.

By his rare inventive genius, a Collegeville machinist has suddenly come into possession of a snug fortune. His name is Claus H. Van Hagen, and he has devised a machine to forge twist drills, for which the Chester Twist Drill & Tool Company has paid him \$25,000 in cash and \$65,000 in stock. In addition to this he has been appointed to the position of superintendent of the Chester works, for which he will receive a weekly salary of \$50. He has all his life been a poor man, and during the 13 years that he has been at work on his invention, he has gone into debt to the amount of \$10,000 or more. He is a German by birth, having come to this country 30 years ago.

A GOOD IDEA.

In the shops of Geo. H. Richards & Co., Broadheath, Eng., the holes for centers in the spindles of lathes of a certain class are all made standard size, so that centers are interchangeable, all the lathe being grouped in a few classes as is practicable. When a center in use is sufficiently worn, or is broken, instead of repairing it, the lathe man takes it to the tool-room and gets another. The dilapidated centers are put in shape in the tool-room, being held in a standard hole in a piece that can be attached absolutely true to the face plate of a grinding machine. It is the work of a boy to grind the centers, and a stock of each size is kept on hand.

SELECTING BELTS.

In regard to this selection of belts for various kinds of machinery, an engineer has prepared, in general, the following advice as a result of considerable experience: Belts of a light color should be selected in preference to darker ones. Superior belting having an unmistakable light buff color indicates that it is oak tanned, and that the leather has been thoroughly washed. This removes all matter except the fiber. This light color is an indication that only the best qualities of grease have been used. An inferior quality of grease not only impairs the quality of the leather, but darkens the color.

AN OBSERVING MAN

once noticed a wheel-rig at work with a measuring-wheel who rolled this little instrument around on the outside of a tireless wheel and determined the proper length of the tire iron. From this a wheel bound with leather was devised, so as to be held in a frame and geared up in a manner so as to show the number of feet it had traveled per minute. By holding this on to a belt, its speed was soon determined and a rough estimate of the power transmitted could be deduced upon by considering each inch in width good for a driving force of 50 pounds.

IN FLOUR-MILLS,

it will be found a good plan to set each set of rolls a few feet apart, so as to give a better opportunity to distribute the product among the machines on the upper floors of the building. When the rolls are set too close together, it obliges the machinery above to be huddled together in the same way, which makes it both awkward and inconvenient. For all mills up to 100 barrels' capacity, three double sets of rolls are all that will be used, and there will be plenty of room to spread them apart.

ENGINEER'S SOAP.

It is said that soft soap, with half its weight in pearl-ash, one ounce of mixture in about one gallon of boiling water, is found of great practical value in engineers' shops, in the drippings used for turning long articles bright in iron and steel. The effect of this mode of treatment is that the work, though constantly moist, does not rust. Bright metals, when kept immersed in it till wanted, retain their polish.

COOLING A JOURNAL.

An ingenious way of cooling a journal that cannot be stopped is to hang a short, endless belt on the shaft next to the box, and let the lower part of it run in cold water. The turning of the shaft carries the belt slowly round, bringing fresh cold water continually in contact with the heated shaft without spilling or spattering a drop of the water.

Gold in Suspension.

EDITORS PRESS:—Your article with the above caption in last week's PRESS, conveying the idea that gold does get into suspension, is well timed, and every article on the subject has its value to the miners for the simple reason that it creates investigation. It must ever be kept in mind that each year brings into the industrial mining field a new body of operators who, if they seek to find and realize the loss of metal by our present modes of working, will be commencing in the right direction. I note that you quote Mr. Florence O'Driscoll's mode of ascertaining that gold is held in suspension. In reading Mr. O'Driscoll's book (*Notes on the Treatment of Gold Ores*, published in London, 1889), I was impressed with the following remarks:

"One of the most remarkable features noticeable when dealing with this subject (gold) is that although decades of centuries have passed since history tells us of the methods employed in saving gold, the same principles are still perpetuated, and the fact remains that every piece of gold saved must possess the inherent quality of withstanding a rush of 'water sinking' through it, and amalgamating with mercury, otherwise it will be washed away and practically lost." After quoting largely of many, many tests, as made in various localities of Australia and other countries, as to the loss of gold by our wet system, Mr. O'Driscoll winds up as follows: "From every part of the world where gold-mining is carried on the tale is the same." Is it not remarkable that such is the case when great progress is made and accepted in all things but saving a high per cent of gold? And here I wish to make an unqualified declaration that there never will be a proper percentage of gold saved in our general system of working until this present mode of wet working is abandoned and all handling of gold rock is by a dry way.

For over 20 years I have been experimenting as between wet and dry, and presume to know whereof I speak. ALMARIN B. PAUL.

San Francisco, Feb. 1890.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

FOR WEEK ENDING FEB. 17, 1890.

421,071.—SAFETY BOLT FOR WHIFFLETREES.—P. H. Flynn, Los Angeles, Cal.

421,131.—CHECK HOOK FOR HARNESS.—Geo. E. Foster, McPherson, Cal.

421,211.—ELEVATED CARRIER.—W. P. Walling, Santa Monica, Cal.

The following brief list by telegraph, for Feb. 18, will appear more complete on receipt of mail advices:

California.—Daniel Best, San Leandro, steering-wheel carriage; W. E. Bowers, S. F., rotary pump; E. A. Cochran, assignor of half to E. J. Beach, Pasadena, pneumatic bar treadle; F. W. Cook, S. F., sawdust burner; W. L. Crooks, Sonoma, and J. Robin, S. F., hair restorer; Oliver J. Fisk, Coulterville, whiffletree connection; Taylor W. Heintzelman, Sacramento, drawade; Cyrus Packard, Fresno, guiding attachment for agricultural implements; James Portens, Fresno, raisin-grader; Samuel H. Pratt, Brownsville, shifter for gang-gaders; Henry S. Pungley, Oakland, journal-box protector; Paul Seiler, S. F., visual annunciator for hall boxes; George W. Swan, assignor of a fourth to W. B. Ewer, S. F., mixing apparatus; Sidney B. Whiteside, Los Angeles, duplex ledger ruler; Ruel W. Whitney and B. K. Cowles, S. F., mouthpiece for telephones.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

The Technical Society.

At the last meeting of the Technical Society of the Pacific Coast, Ross E. Browne and Hans C. Bahr read a paper descriptive of experiments made with Dr. Pohl's air-lift pump. The machine consists of an engine, a receiver, an air pipe and a water column into which the compressed air is delivered. The compressed air is delivered into the column in layers lifting sections of water and air alternately.

The paper read was the result of a series of practical experiments made by the authors, and was illustrated by tables and a miniature pump in glass and rubber, showing the results to be obtained with compressed air as a water lift. A large volume of water can by this means be raised to almost any height, the practical limits being 100 feet at a single lift. But successive lifts may be made. There are no pump rods, or bobs, or valves of any kind in this apparatus.

The efficiency of the pump is demonstrated by a table showing that with the piston registering 270 strokes and the compressor working against a temperature of 19.4 degrees, the compressor was delivering to each stroke the great amount of .084 pounds of air, and the efficiency becomes greater with the reduction of the stroke. The authors of the paper were given a vote of thanks.

BELT MOVEMENT.

There is quite a difference in the speed of a belt when measured on the tight and on the slack sides; the tight side moves faster. The difference can be attributed only to the stretch of the belt on the tight side.

The Ellensburg, Wash., Board of Trade has been reorganized, and will endeavor to start up iron manufactures.

PARKE & LACY COMPANY

— IMPORTERS AND MANUFACTURERS OF —

MINING, MILL and GENERAL MACHINERY.

ENGINES, BOILERS, STEAM PUMPS,

AIR COMPRESSORS, ROCK DRILLS,

WALL'S CRUSHING ROLLS,

CONCENTRATORS, PULVERIZERS,

TURBINE WATER WHEELS,

ROCK BREAKERS, DRY JIGS.

Bullock's Diamond Drills

GOLDEN GATE CONCENTRATORS,

GREATEST CAPACITY OF ANY CONCENTRATOR MADE,

One Machine Taking Pulp from 10 Stamps.

SAW MILLS, MACHINE TOOLS,

PLANING MILLS, INJECTORS and EJECTORS

BELTING, PACKING, OILS, LUBRICATORS,

FIRE EXTINGUISHERS,

GENERAL AGENTS FOR WESTINGHOUSE AUTOMATIC ENGINES.

SALES DURING LAST FOUR MONTHS:

COMPOUND, 44 ENGINES,
5215 HORSE POWER.

STANDARD, 99 ENGINES,
4500 HORSE POWER.

JUNIOR, 166 ENGINES,
4260 HORSE POWER.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal.

189 Clarence St., Sydney, N. S. W.

NOTICE TO GOLD MINERS! SILVER-PLATED AMALGAMATED PLATES For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER
AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
108 and 112 First St., San Francisco, Cal.

SEND FOR CIRCULARS.

JUSTINIAN CAIRE, Agent,

521 & 523 Market St., San Francisco,

—DEALER IN—

Assayers' and Mining Material.

—MANUFACTURER OF—

BATTERY SCREENS AND WIRE CLOTH

Agent for HOSKINS'

HYDRO-CARBON ASSAY FURNACES

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAM PLATES for SAVING GOLD IN QUARTZ, GRAVEL AND PLACER MINING. PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

F. A. HUNTINGTON,

— MANUFACTURER OF —

CENTRIFUGAL ROLLER QUARTZ MILLS, Concentrators and Ore Crushers,

Mining Machinery of Every Description. Steam Engines and Shingle Machines.

SEND FOR CIRCULAR.

Centrifugal Roller Quartz Mill.

213 FIRST STREET,

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, depending with gearing. Estimates furnished on application for wheels especially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbine for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents,
Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

CALIFORNIA IRON YARD.

Hydraulic Mining Property in Southern Oregon. Good, Extensive. For particulars (Principals only) address,

"A. M.," Box 77,
Grants Pass, Oregon.

THOMAS PRICE & SON,

Assay Office, Chemical Laboratory,

BULLION ROOMS and ORE FLOORS,

524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

SELBY

SMELTING and LEAD CO.,

416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

— MANUFACTURERS OF —

BLUESTONE,

LEAD PIPE,

SHEET LEAD,

SHOT, Etc., Etc.

ALSO MANUFACTURERS OF

Standard Shot-Gun Cartridges,
Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scoffers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the Morgan Crucible Co., Battersea, England. Also for E. G. Dennison's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 28 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager.

ESTABLISHED 1890

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt,

Mining Engineers and Metallurgists.

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut or hurred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,

221 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families.

HOT and COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day
And Upward.

Rooms with or without Board.

Free Coach to the House.

J. POOLEY.

MONTANA has a population of about 250,000 souls, in round numbers. Of this number, more than 25,000 are actively engaged in the production of the precious metals, while the balance of the population are either directly or indirectly interested in the mining industry.

Inspection of Mines.

EDITORS PRESS:—In your issue of February 8th, Mr. Geo. Kieselburg, Assistant Inspector of Mines of Silverton, Colorado, evidently wishes to be known that he is acting in that capacity, and states that the "writer of the article on 'Prevention of Mine Accidents' is certainly not well posted when making the assertion that we have no Governmental or State officials to inspect mines, etc." If he reads my remarks again of Jan. 18, 1890, he will see I refer directly to the State of California and to no other. My philanthropy is possibly so dulled by the unphilosophical ways of our Golden State that I omitted to mention and quote Colorado, etc., as an exception. However, I apologize for the omission and congratulate those more advanced Eastern States that they do possess such official inspection, thereby seeing to the safety and welfare of their miners. They have thus set a thoroughly good example for us to follow, and I trust our legislators will imitate this much-needed reform in the near future.

"ARGUS."

THE CORTEZ MINE.—A few years ago the Cortez mine, near Beowawe, then owned by S. Wenhan, was considered valueless except by its owner, and it had run him in debt all that he could get trusted. He succeeded, however, in getting his son-in-law, who was a wealthy cattleman, to advance money enough to buy provisions and mining tools until he finally struck ore which paid more than expenses. After he had paid all indebtedness and ran his bank account up to six figures, he went to London, where he incorporated the mine and disposed of a part of the stock, he retaining a controlling interest and the management of the mine. Last year the net profits of the mine were \$247,000, and dividends amounting to \$150,000 were paid the stockholders. The ore reserve is said to be larger than at any previous time, and the Cortez, which some years ago would not sell for a thousand dollars, could not be bought to-day for a million, and it is doubtful if the English stockholders would sell even at that price. Mining is in many respects risky business, but there are not many things, since the breaking up of the Star Route and Naval rings, that pay so well.—*Silver State.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

CHAS. M. MOODY—Oregon.
H. G. PARSONS—Washington.
R. G. HUBSON—Montana.

A SENSIBLE CALENDAR.—As usual at this time of the year the new crop of calendars is coming in; they are of all sorts, sizes, shapes and kinds, and many of them can be bad for the asking, but the BEST calendar that comes to our office is that published by N. W. Ayer & Son, Newspaper Advertising Agents, Philadelphia, and which they send postpaid to any address on receipt of 25 cents. This calendar is 14x22 inches, the upper portion being beautifully printed in colors, while the monthly sheets are printed with figures so plain that they can be easily seen at a distance. Although the calendar is an advertisement of their ever-growing business, it is at the same time so valuable to those having use for a calendar that year by year the sale steadily increases.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

AN IMMENSE LANDSLIDE at Dixon's Bar on the Trinity river, last week, dammed up the river for some 14 miles. At Wash Henstie's mine, where the house is 150 feet above the river, the water came up to within 10 feet of the door. John Hedges' house, six miles above the slide and 70 feet above the river, was washed away. This slide was the heaviest ever known on the Trinity river. Two Chinamen were killed who were mining on the bar.

"STOCK."—About the only stock that is not affected by the inclemency of the season is the Tascorora mining stock. There is no loss of hullion from cold, starvation, or exposure, and there is plenty of sagebrush and pine-wood fodder to feed the furnaces until this new crop comes in with the melting of the snow.—*Tascorora Times Review.*

SNOW NEAR DOWNIEVILLE.—From a private letter from the superintendent of the Red Oak mine, near Downieville, Sierra county, we learn that the amount of snow in that section is remarkable. It is 16 feet above the very top of the dump-shed and 35 feet on top of the woodshed. It is 40 feet deep on a level.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstract calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:

General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Minors' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

Assessment Notices.

Gray Eagle Mining Company. Location
of principal place of business, San Francisco, California.
Location of Works, Placer Co., Cal.

NOTICE is hereby given that, at a meeting of the Board of Directors, held on the 21st day of January, 1890, an Assessment, No. 16, of Four (4) Cents per share was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-fifth (25th) day of February, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 17th day of March, 1890, to pay the delinquent assessment, together with the costs of advertising and expense of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California St., San Francisco, California.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$5.00 post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

INVENTORS, TAKE NOTICE!

DEWEY & CO.'S

Scientific Press  **Patent Agency.**

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

The Dewey Engraving Co.

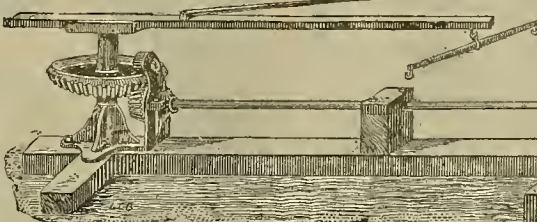

Photo Facsimile

220 Market Street.
SAN FRANCISCO.

Engravings made from photographs, drawings and original designs, for newspaper, book, card and job printing. Engraved prints enlarged or reduced, cheaply and quickly. Also copies of manuscript, legal documents, wills, contracts, signatures, portraits, buildings, machinery and printed documents reproduced with accuracy. Photographs, stereoscopic views, etc. duplicated, enlarged or reduced. Slides for magic lanterns made from photographs, lithographs, and steel or wood engravings, etc. Satisfaction guaranteed. Agents wanted in all cities and in all towns. Address, for further information, DEWEY ENGRAVING CO., 220 Market St., San Francisco.

KROGH'S MINING HORSE-POWER HOIST

It is known to be the Best Horse-Power Hoist now made. It is strong and durable. The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump or blower, in conjunction with hoisting. Manufactured by F. W. Krogh & Co., 51 BEALE ST., San Francisco.

CHEAP AND CONVENIENT

CHAIN PULLEY

The engraving here illustrated is a new lifting apparatus of that kind in which great power is necessary, and which will stand and hold its load at any point where it is left. As the engraving shows, there is a pulley over which the lifting chain passes, and upon the same shaft two gear wheels, so fixed that their teeth alternate—that is, the teeth of one wheel correspond with the spaces of the other. The pulley on the right, over which the cable actuating chain passes, is fixed to a shaft, which has four crank arms turned upon it, corresponding with the gear wheel and with the size of their teeth, so that when the shaft is rotated the crank arms or pins engage the teeth of the gear wheels, one after the other, and thus advance the chain pulley. This device also forms a perfect lock when left at any point.

The pulley-chain pulley, placed between the large gear wheels, brings the weight right under the supporting hook and balances the machine. The operation may stand on one side and haul on the other, and need not be lifted under the machine. The device is simple, compact, strong and efficient, and is quite ingenious in design. These machines have lately been put on the market and are made here. The invention evidently improves in a large degree, the construction of differential chain pulleys, makes them less in cost, weight, wear, and repairs, and easy of handling and operating. The new device is worthy of the attention of manufacturers and all users of such articles. The size for a half-ton lift weighs only about thirty pounds.

WANTED.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

ATTENTION, MILLWRIGHTS!

A BOOK YOU ALL WANT.

Leffel's Construction of Mill Dams and Bookwalter's Millwright and Mechanic.

A STANDARD WORK.

This practical work of 288 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Pairs have been taken to thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill-owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.
Price 50 cents, post-paid. For sale by DEWEY & CO., 220 Market St., San Francisco, Cal.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), London, October 3, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

“TRIUMPH” ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the “Triumph” Ore Concentrators, the “Frue” Vanners and other forms of concentrating devices, do not warrant the assertion that the “Frue” Vanner is the best ore concentrator in the market. The fact that the “Frues” have improved (corrugated) belts does not militate against the superiority of the “Triumphs;” for, when desired, they (the “Triumphs”) can be mounted with a superior belt known as the “Blasdel” Riffled.

Price “Triumph” Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price “Triumph” Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the “Triumph” over the “Frue” or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the “Triumph” Concentrator and “Blasdel” (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company, Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the “Triumph” Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR., [Signed]

Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more “Triumph” Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. | D. C. WICKHAM, Taylor Mine, Greenwood, Cal.
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. | J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
And will furnish descriptive Catalogues and quote prices upon application.

—THE—
**PERFECTED
DOUBLE
Economic
Quartz
Mill.**

Attached to each Mill
is an effective
**Automatic Ore
Feeder.**

THE CRUSHING is done by the rapid rocking movement in OPPOSITE DIRECTIONS of two heavy castings, the bottoms of which are slightly circular in form, and each provided with our shoes.

The Mill is a closer Gold-Saver and catches a larger percentage of the Clean-up in the Battery than any other Mill.

It costs less, in proportion to what it will do, than any other mill. There are no working parts to buy for it, no matter how long it is used, except shoes and dies. Capacity of Mill, 9 to 10 tons per day. Weight of Mill, complete, 6400 pounds.

We manufacture, to go with the Mill, an

IMPROVED ROCK BREAKER.

Power required for Mill and Rock Breaker, 6 H. P. SEND FOR CIRCULAR. Address

TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,
AND PORTLAND, OREGON.

MANUFACTURERS OF MINING AND SAW MILL MACHINERY.

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity of three tons per hour of hard quartz to 40 mesh; has been thoroughly tested; we guarantee its work as represented, and we will give long time trial.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS

And renewals will not cost over one-half as much as for stamps. Will run empty, or with small amount of ore without injury. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh; 30 to 35 H. P.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY.

Corliss Engines for Cable Roads.

On this page is an engraving showing an application of Corliss engines of 400-horse power for driving the cable gearing of the Hayes-street cable railway. The Union Iron Works of this city have constructed the Market street, Valencia, Haight, Hayes street, McAllister street, Geary street, Sutter street and Howard street cable railway plants in San Francisco, and have the most extensive collection of patterns, drawings and plans for this kind of work that exists in any single works in the world. The steam-power and method of gearing varies in each case, but the results are quite uniform. All the engines employed are of high class, with variable expansion gearing, and in most cases compounded. Those of the Market-street system have an aggregate of 350-horse power, divided into three sections.

The Union Iron Works are prepared to contract for and erect complete works for cable railways in any part of the United States, or in foreign countries, and to guarantee successful working of such plants. This system for modern railways is steadily gaining ground, and is more complete and economical than the horse-car method. The system originated in San Francisco, where there are now 12 lines; and in no case have there

ENGINES AND CABLE GEARING OF THE HAYES STREET CABLE RAILWAY.

WORKING A SERPENTINE QUARRY.

been failures and losses such as have occurred in the Eastern States.

Serpentine Rock.

Inexhaustible quantities of serpentine of a deep green or yellowish color occur in the region around San Francisco, and often in such situations as to be easily available, as at the head of Market street. So far as opened, none of the material is of such a quality as to render it of value for ornamental work, while its gloomy color renders it equally objectionable for purposes of general construction. The rock is also abundant in other parts of the State.

In Pennsylvania this rock is used for building. Quarries have been worked at Chester for 100 years. The accompanying engraving, from Merrill's "Building and Ornamental Stones" (Smithsonian Institute), shows a serpentine quarry. The rock occurs only in a jointed condition, and blocks of large size cannot be obtained. The largest yet quarried was 3 feet square by 16 feet long. It is used in Philadelphia to the greatest extent, but is also shipped to New York, Baltimore, Washington and Chicago.

The little town of Boulder Creek, Santa Cruz county, has had 107 inches of rain so far.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Placer County.

EDITORS PRESS:—Placer county lies in the north-central portion of the State, with a length of 95 miles and a width of 8 to 25 miles, the western or Sacramento basin part containing 675,000 acres, while the mountain or Tahoe basin contains 170,000 acres. The adjoining counties on the north are Yuba and Nevada; south, El Dorado and Sacramento; west, Sutter, while the eastern boundary forms the State line.

The topography is varied, not only in the county as a whole, but on single holdings as well. The level alluvial plains of the Sacramento valley and the rugged mountains are repeated, though on a smaller scale, in almost every mountain range, thus making the county not alone picturesque but affording beautiful and healthful sites for homes, while the elevation secures exemption from damaging frosts and by reason of the greater degree of warmth, produces not alone earlier but much finer fruit.

Products.

By reason of the large fruit shipments the impression is given that fruit alone is grown in the county, and that fruit is the only product. In the old river channels, now sealed up and almost as effectually closed as though buried thousands of feet, are looked up millions of dollars in gold. These are slowly being reopened and worked by drift-mining, and promise in the coming century to produce many millions. The quartz mines are being developed and proving very profitable. In the valleys the cereals are grown extensively. The lower foothills produce the small fruits, cherries, apricots, peaches and the citrus fruits; the middle foothills, the grape, olive and fig, while in the higher elevations, the apple and the pear do best. The fruits are not confined to any one locality or altitude. The peach is a success from Roseville in the plains, to Auburn, while the Aloha, the largest northern citrus nursery in the State, is located at Auburn and with its 120,000 of most thrifty, acclimated orange trees shows how well the elevated portions of each fruit ranch can be made to produce exceptionally fine oranges.

Towns.

The stranger entering the county from Sacramento finds the beauty and thrift of the county growing as he advances. At Roseville the principal product is grain, though there are some fine fruit ranches on the hyroade. The town is similar to those of the plains and is not apt to impress the stranger favorably.

Rocklin shows more thrift and business; her large granite quarries employ a large force of men, while the fruit interests are shown in occasional citrus and fruit orchards.

Loomis is fast crowding ahead; the thick underbrush is fast being cleared away and innumerable orchards taking the place.

Penryn, though quiet, is home-like. Her granite interests are quiet, owing to the death of Mr. Griffith, the owner; but not so her fruit interests. Her shipments have gone on increasing, while Strong & Co. have put in a fruit-shipping house where carload after carload of fine fruit is shipped throughout the season. Mr. Butler's famous peach orchard is half-way between Penryn and Loomis, while there is acre after acre of all varieties of fruit in every direction.

Newcastle claims the distinction of being the fruit center, and from this point the greater portion of the county's fruit is shipped. It would be less difficult to state what will not grow, and is not grown, in this section than to give a correct list of all the fruits and vegetables grown.

Auburn is the county seat and business center of the county. While the fruit shipments do not equal Newcastle, the volume of business in other channels will exceed. Fruit, however, is not neglected. On every side can be seen row after row of trees standing like plumes against the hillsides. It is the town itself that impresses the stranger most favorably. The succession of fine homes with beautiful yards surrounding them, elegant hotels filled with seekers after health and pleasure and the general courtesy of the citizens toward the visitor make Auburn the most desirable place of residence in the county. Within the past two years the improvements have been most marked, as evidenced in the large number of fine homes and business buildings erected and in the course of erection. The fact is, the people are prospering and that as never before.

Applegate, Weimer and Colfax are but railroad stations, Colfax being the larger town and having a few stores. While the county claims the belt as a peach center, other fruits do equally well and none more so than the fig. In fig culture and curing, Placer has made a success.

Soils and Health.

In the matter of soils, the county is as varied as are the opinions of the citizens in regard to their merits. From Roseville up to Newcastle the soil may be said to be granitic. This soil produces fine fruit, but should be irrigated liberally to yield the greatest profit. From Auburn to Colfax the soil is slate and clay. With thorough cultivation, trees and vines can

be grown successfully without irrigation, though it is generally admitted that "it pays to irrigate."

As in soils, so in health; each location claims exemption from all malarial influences. By carefully selecting the site for the house, and placing it on the highest knoll, comparative exemption from malaria can be secured. Low situations in irrigated districts are to be avoided, not only in Placer but in all parts of the State. The people living on the slate soils claim exemption from malaria, and charge it to the granite soil. This matter can best be tested by a personal visit in midsummer's irrigating season. I believe that the low lands and gulches are not desirable, in point of health, but I am confident that owing to the variety of the topography, a home site, free from malaria, can be secured on every 160 acres of land.

E. H. SCHAEFFLE.

An Object-Lesson.

Storing Water at Small Cost.

The people at and about Honey Lake valley are fully awake to the utility of water storage. They have experienced the benefits of having a supply of water upon which to draw in the dry season through a few small pioneer reservoirs constructed a year or two ago, and the lesson was not lost. Last fall about a dozen reservoirs were commenced. A few were completed and work has been pushed on others nearly all winter. Some of the dams are of large size. All are earth embankments faced with stone or plank. The only regret of the people now is that they did not begin work on their dams earlier in the season, several large ones not yet being completed.

The Lassen Advocate, published at Susanville, says that all the reservoirs might have been filled ere this had the dams been properly supplied with waste sluices. These not having been provided, it has been necessary to watch some of the dams day and night.

An account of one reservoir and the situation at it will serve for all others that are not yet finished. The Bill's Canyon reservoir is being built by Susanville men at a point about 14 miles east of that town. Work on the dam was begun last September. The main dam is 250 feet long, with a wing extending out upon a low bench a distance of about 250 feet farther. The main fill will be 40 feet high, with 200 feet base. It will be paved with rock on the inside from bottom to top, and near the top will have a waste-weir of plank 30 feet wide and 5 feet deep. The water is to be drawn off for use through two iron pipes—one of 15 inches diameter on the bedrock and one of 22 inches diameter 11 feet higher. The dam will flood 110 acres to an average depth of 30 feet.

It was expected that the dam would be finished by Feb. 1, but the bad weather prevented. When the thaw came, the waste-weir had not yet been put in. To save the dam required the coat and work of 15 men day and night for 48 hours.

The Advocate of Feb. 6 says: "The waters rose to the very top, and were conducted through a cut on the east end, which was prevented from widening by the efforts of the men, who had to watch it every moment until the angry flood subsided. The two pipes—one 15 inches and the other 22 inches—were throwing out a stream of water 25 feet from their mouths, and the entire space within the dam away up the canyon was one sea of water."

This reservoir is built on no stream, but has above it a very large watershed. Several other reservoirs that have been built or are being built depend on similar watersheds. The Bill's Canyon reservoir will irrigate a large tract of land lying east of Honey Lake. The embankment of the dam is composed of sand and loam.

The cost is not stated, but for the benefit of our readers who may think of undertaking similar works, we will mention a dam or two, the cost of which is given.

The dam built for J. H. Williams has a length of 150 feet; base 60; width on top, 20 feet; height, 20 feet; covers 200 acres of land and irrigates two sections of land; built 1887, and cost \$600.

Another reservoir built in 1887 is 500 feet long, 9½ high, 8 feet wide on top, and has a base of 33 feet. It forms a lake of 500 acres and cost only \$600. No living water.

One more example which we shall give, condensed from the Advocate, should make scores of converts, as it shows that it does not cost very "big money" to build a first-class reservoir. The reservoir of the Lassen County Live-stock Co., completed and now full of water, is 225 feet long, 45 high, with a width of 125 feet at the base and 12 feet at the top. It is built of rock and earth, well packed, and is faced on the inside with 3-inch plank. It floods Round valley, a basin of 310 acres, to a depth of 40 feet, and it cost but \$2000. The company has a tract of several thousand acres of rich dark loam which will be irrigated. The dam is fed by no living stream, but has a great area of watershed. The company has irrigated several hundred acres of its land with the water that flows naturally down the canyon in the spring of the year.

OLD MINERS believe that this will be the greatest mining year ever experienced in Southern Oregon.

A TWO FOOT vein of solid galena is reported in the bottom of the Queen of the Hills mine, Idaho.

The Cassel Gold-Extracting Process.

Mr. H. A. Jones, general manager and secretary of the Cassel Gold Extracting Co., has arrived in Denver, Colo., to introduce the process there. He says:

"Our process, which has been in practical use but little over a year, is one which will reduce the most refractory ores and decrease the cost from the present cost of \$15 to \$20 per ton to \$5 per ton. In our works in Glasgow, where we have used ores from New Zealand and other parts of the world, the absolute cost of the chemicals required in extracting gold and silver from any kind of ores was \$1 per ton. This was the essential cost. The rest of the expense will be not to exceed \$5 per ton, and we make the reduction in one operation, taking the raw ores from the mines without roasting or concentration. No roasting is necessary, although concentration can be applied if necessary or thought practicable by mine-owners or ore-shippers."

The process of which Mr. Jones is the manager was invented and patented by John Stewart MacArthur of Pollockshields and Robert and William Forrest of Glasgow, Scotland, May 14, 1889. They have letters patent in South Africa, South Australia, Canada, New South Wales, New Zealand, France, Belgium, Brazil, Portugal, Italy, Spain and the United States.

The first plant was erected in Glasgow, and last July made a run of 22 tons of New Zealand ore. The result was such a success that another plant was erected there and one in South Africa. The fourth one is being built at the Crestone mines in Saguache county, Colo., under the supervision of Dr. M. Werner, who has been experimenting with the new process on Colorado ores, besides having sent 60 samples to Glasgow for treatment. The works in Saguache will have a capacity of 15 tons per day and will be in operation about March 1st.

"The process," said Mr. Jones, "will revolutionize the present system of reducing ores, and is no longer an experiment. When we can take raw ores from the mines, containing all the metals, and obtain the gold and silver by a single operation at a cost of not to exceed \$5 per ton, you can readily perceive the result."

There is no secret about the process. In fact, it is described in the letters patent. It depends upon the great chemical affinity of cyanogen for gold and silver, and the ease with which these metals form soluble double cyanides with the alkali metals. The process on a large scale is carried out, according to Mr. Wm. Jones in the December number of the *Engineering and Mining Journal*, as follows:

"The ore, without any previous roasting if sulphur should be present, ground to 40 mesh, are placed in pans or wooden vats provided with a stirrer, and to every ton of the ore there is added about 100 gallons of water containing one quarter, one-half or three-quarters of one per cent of cyanide of potassium or sodium or other percentage which experiment in the laboratory shows to be the best approximate strength to use. The whole is then stirred for four to eight hours, the length of time depending upon the nature of the ore. The liquor is then run off, carrying with it on an average 85 per cent of the gold contents of the ore and 80 per cent of the silver. It is filtered, and the gold and silver in it are precipitated by passing slowly through zinc turning, when complete precipitation of the gold and silver takes place. They attach themselves as a loose powder to the zinc, and are easily removed by shaking or stirring, the gold and silver precipitate on sludge falling to the bottom of the vessel, and is removed, dried and melted in the usual way."

THE KARA MINES.—Mr. Kennan describes the Kara mines, where the recent Russian atrocities occurred, as follows: The mines of Kara, which are the private property of his Imperial Majesty the Czar, and are worked for his benefit, consist of a series of open gold placers, situated at irregular intervals along a small rapid stream called the Kara river, which rises on the water-shed of the Yakhonoi mountain, runs in a southeasterly direction for a distance of 40 or 50 miles, and finally empties into the Shilka, between Stretinsk and the mouth of the Argun (Argoon). The name "Kara"—derived from a Tartar adjective meaning "black"—was originally used merely to designate this stream; but it is now applied more comprehensively to the whole chain of prisons, mines, and convict settlements that lie scattered through the Kara valley. These prisons, mines and convict settlements, taking them in general order from south to north, are known separately and distinctly as Uet Kara or Kara mouth, the Lower Prison, the Political Prison, the Lower Diggings, Middle Kara, Upper Kara, and the Upper or Amurski (Am-moor-skee) Prison. The administration of the whole penal establishment centers in the Lower Diggings, where the Governor of the common criminal prisons resides, and where there is a convict settlement of 200 or 300 inhabitants and a company or two of soldiers in barracks.

DIDN'T FIND OUT.—The Sierra Tribune is responsible for the following: A couple of the owners of the Battle Saddle mine went up there this week to see if everything was all right. They did not take a shovel with them to dig in the snow for the cabin because they had, before any snow fell, tied a shovel 30 feet higher than the cabin, to a pine tree, in order that they

might have it in case they had to go up to the mine during the winter. When they arrived at the spot Monday, they could only see a little of the pine tree. The snow had covered the cabin, shovel, and nearly all of the tree. It is believed to be about 60 feet deep. The boys, of course, came back to town without finding out whether their cabin was there under the snow or not, but they think that it will turn up all right in the spring, with the shovel hanging to the tree above.

New Coal Mines.

Few people are aware of the efforts which are being made to emancipate San Francisco from its dependence on British Columbia and Australia for its coal supply. Several years ago seams of coal were discovered in the northern part of what was then known as Washington Territory. One of these was in the extreme northern part of the Territory, close to the British Columbian line and on the westerly range of an extended coal-field. The coal was a lignite of fair quality. Another was on Oerhon river, some 30 miles northeast of Tacoma. This was a bituminous coal, hard and clean, but not as rich in carbon as the Eastern coal. Neither of these coals was equal in quality, either for heating purposes or for cooking or steam, to the Wellington coal, and the railroad has been obliged to rely on importations for the bulk of its supply.

A year or two since other extensive coal-beds were discovered, also in Northern Washington. An option was secured on them by C. P. Huntington, who was satisfied from samples which he received from trustworthy sources that the coal was as good as the Wellington. An arrangement was then made with Villard of the Northern Pacific to build a railroad from the new mines to the seahoard and to erect sheds at the landing capable of containing many thousand tons of coal. The mines and the road are to be the joint property of the Southern and Northern Pacific Companies, or of a company to be formed out of their stockholders, and to carry the coal to San Francisco. Three steam colliers of 3000 tons each have been built or are in course of construction.

If the reports of the mining experts are confirmed by the practical working of the mines, this discovery will break down the control of our coal market, which has been held by the Danemuir and the collieries in New South Wales. To compete with our own coal these foreigners will have to reduce prices, and instead of paying \$10.50 per ton for coal in this city, householders should be able to supply themselves at a trifle over half that figure. Not the least charm in the prospect is the impossibility, after the new mines are opened, of cornering the market in San Francisco under the pretense of a strike or a fire in the mines.

ELECTRICITY AND MINING.—One of the greatest fields that electric power has of late been called upon to enter is that of mining, remarks the *Electrical World*. The use of the electric light in mines is not new, and possibly its success has helped create the demand that has sprung up for power appliances. But that as it may, there can be no doubt as to the reality and extent of the demand, and vast as are the fields already opened up for the electric motor, it may be seriously questioned whether the opportunities in mining, the latest sphere of its occupation, do not surpass all others. We believe that 1890 is destined to be the connection year as the starting point of electric mining on a grand scale, as 1889 was for electric railroading. One cheering feature in connection with the new departure we have thus distinguished is the hearty welcome accorded the new power by mining journals, mining experts and the mining world in general. There has been at once an absence of prejudice and a keen appreciation of the advantages that electricity can give, and it now depends upon electrical inventors and electrical engineers to rise to the occasion and reap the rewards that await ready ingenuity and honest work. They may form some idea of the immensity of the field from the fact that the value of American mining products in 1888 exceeded \$590,000,000, and during the past year the industry has been no less prosperous. It is the province of electricity not only to aid in the economical and safe production of this great wealth, but to bring up to the point of remunerative productiveness hundreds of mines that are worthless under other conditions.

ORE AND BULLION YIELD.—Following is the official report of the ore and bullion yield of the Comstock mines named below, during the quarter ended Dec. 31, 1889: Justice produced 2846 tons of ore, yielding bullion valued at \$58,779.89; total cost of extraction and reduction, \$56,810.05; yield of ore in bullion, \$20.05 per ton; total yield above cost of production, \$1969.84. Bullion tax on net proceeds, \$98.49. Occidental Con. produced 3140 tons of ore, yielding bullion valued at \$47,760; total cost of ore extraction, \$18,600; cost of reduction and sale, \$29,470; yield of ore in bullion, \$15.25 per ton; cost of production above yield, \$400. Crown Point produced 5675 tons of ore, yielding bullion valued at \$69,381.94; total cost of extraction, transportation and reduction, \$74,394.55; average yield of ore in bullion, \$12.25 per ton; cost of production above yield, \$5012.51.

Irrigation on Public Lands.

Senator Stewart has prepared an Irrigation bill to be introduced at the first opportunity, upon which he invited the criticism of the Western press and people. The bill provides:

SECTION 1.—That the United States shall confer upon organizations, to be known as irrigation districts, certain specified powers, the first being those possessed by all corporations, to sue, be sued, have a seal, acquire the property necessary to establish a complete irrigation system for each district, to elect officers of each district by a popular vote, to construct reservoirs, canals and other hydraulic works necessary to a complete system of irrigation, to make laws for the equitable distribution of water within the districts, to levy and collect taxes upon all arable lands within the districts, public and private, and to raise money for the construction and maintenance of irrigating works.

SEC. 2.—Whenever the Governor of a State or Territory in which an irrigation district exists shall notify the Secretary of the Interior of the existence of such organization, and shall certify that the organization is in good faith, made with the consent of a majority of the people residing interested in such district, it shall be the duty of the Secretary to cause a survey to be made. Such district shall include in its boundaries all arable lands which can be irrigated by a general system of irrigation, which can be regulated by the same general rules. They shall also include in such district such pasture, timber lands, reservoir sites, lines of ditches and places for other hydraulic works as may properly belong to such district, and shall fix a time within which irrigation work shall be completed.

They shall then divide the district into the following areas: First, reservoir sites, ditch lines and other places for hydraulic works; second, lands susceptible of irrigation; third, pasture lands; fourth, timber lands.

The arable lands shall be subdivided without delay into 40, 80, 120 acre tracts, and shall be subject to entry under the homestead laws only. The arable lands of the United States in such district shall be subject to the same charges, taxes and assessments as are imposed upon private lands receiving like benefits.

All charges, assessments, and taxes levied by the irrigation organization upon arable lands of the district, together with the legal interest on such charges, shall be a lien upon all arable lands within the district to be irrigated, and persons who shall thereafter acquire title to any such arable public lands shall take the same, subject to the charges and interest. All lands in the district shall be withdrawn from entry and sale except mineral entries, also except as provided by this Act.

SEC. 3.—Whenever irrigation works necessary to furnish arable lands with water shall have been constructed in a substantial and durable manner, according to plans approved by the Secretary of the Interior within the time fixed by him, and there shall be an actual resident who is the owner on each legal subdivision of arable public lands in such district entered under the provisions of this Act, the Secretary shall issue a certificate that the irrigation of said district is complete and that the public lands therein contained are in bona fide possession of citizens of the United States or those who have declared their intention to become such, and that such citizens are residing on the lands.

The timber pasture lands in such district shall thereupon become the property of the district, and the district organization may sell such timber pasture lands in such manner as Congress shall approve. Patents shall thereupon be issued for homestead entries made in pursuance with the provisions of this Act; also for all other bona fide entries of arable lands in the district which were made before the establishment of the district, provided that applicants for such lands shall have performed the acts required by the law under which the entries were made, but as to desert entries no further proof shall be required as to the desert character of the land or the fact of reclamation.

SEC. 4.—Whenever an irrigation district shall be situated in two or more States, it will be necessary for each State in which any portion of such district is situated to confer upon such district the powers and privileges hereinbefore set forth.

[There seems now a most wide and gratifying interest in the development of the waste regions of the great West. It is true that there is opposition on the part of some Eastern producers who think that further extension of the food-producing power of the West will be fatal to Eastern farming specialties. It seems to us that such opposition is not well taken. The Eastern farms, by reason of their proximity to almost limitless markets, have an advantage which can never be taken from them, providing the producers use their opportunities wisely. It is true that there may be needed some changes in their choice of crops and methods of farming, but it seems altogether unlikely that wise productive efforts expended in the vicinity of such vast millions of capable purchasers will ever be unprofitable. The East should also look upon the West as but the field for the enlistment of their surplus population.]

In giving the West a chance to grow and to offer opportunities for enterprise, the Eastern people of the present generation are only wisely preparing places for the prosperity and comfort of their own sons and daughters. The West now gratefully acknowledges paternity in the East, and the recognition of such relations will grow wider as the years advance. The enterprise which incites an individual farmer to reclaim and make productive the swamps and back lots of his own farm to provide for a growing family is only on a small scale the work which Uncle Sam should do with his vast waste regions to give homes and comfort to his multiplying millions. It seems to us that any narrow view or direful apprehension at the East of the influence of the growth and development of the West is unnecessary and ill-placed. We trust a full discussion of the subject will rescue the people of the East from the maintenance of such views.—EDS. PRESS.]

A RAILROAD ON TREE TOPS.—A well-known but curious fact is thus stated by the *St. Louis Republic*: It may not be known outside of the neighborhood in which it is situated, but it is nevertheless a fact that in Sonoma county, Cal., there exists an original and successful piece of modern engineering and building that is not to be found in the books. In the upper part of the county named, near the coast, may be seen an actual roadbed in the tree-tops. Between the Olipier Mills and Stuart's Point, where the road crosses a deep ravine, the trees are sawed off on a level with the surrounding hills and the timbers and ties laid on the stumps. In the center of the ravine mentioned two huge redwood trees, standing side by side, form a substantial support. These giants have been

SUGGESTIONS FOR ECONOMICAL BRIDGES.

lopped off 75 feet above the bed of the creek. This natural-tree bridge is considered one of the wonders of the Golden State, and for safety and security far exceeds a bridge framed in the most scientific manner.

WILL RESUME WORK SOON.—Capt. Richards, who returned Friday from the Centennial mine, had an interesting trip. At the mouth of the tunnel he found the snow ten feet deep on the level. The current of warm air ascending from the tunnel had kept open an incline as round as a barrel, three feet in diameter and ascending to the snow's surface at an angle of 45 degrees. Down through this the captain descended into the tunnel, where he found everything in good condition. The cabin and blacksmith shop at the mine have both been flattened by the snow. He will go up there in a few days with some men and recommence driving the tunnel ahead.—*Nevada Transcript*.

AT VICTOR.—A ten-stamp mill has been erected at Victor, Los Angeles county, on the line of the Santa Fe railroad. It is expected the mill will be completed and in full operation within the next 40 days for crushing the ores of the Side-winder mine, distant nine miles from Victor, in the Silver Mountain mining district. It is also reported that an English company is to put up a mill about 25 miles from Victor, in the Holcomb mining district, to work the ores of the Black Hawk mines. Machinery will also soon be built on the Morongo mining property, 28 miles from Victor, in the Morongo district.

GUARDING AGAINST POSSIBLE DANGER.—For guarding against the perils of broken electric wires, when their ends fall on neighboring wires or metallic roofs, either of which may become mischievous conductors of the fluid, the *Electrical World* notices a simple apparatus, invented by Mr. E. P. Clark of New York, by which, "on the instant of a break occurring in the circuit, the dynamo ceases to generate current and remains inoperative until the break is repaired." If this device is all that is claimed for it, it will go far toward removing "the deadly wire" from the newspaper reporter's vocabulary.

A GENERAL STRIKE is threatened throughout the State of Alabama involving thousands of coal miners and causing 15 or 20 blast furnaces to close down.

THE Young America Gold Mining Co., Sierra county, cleaned up \$16,000 for the month of January.

Economical Bridges.

(Written for the Press by SECCA.)

I live in the Coast Range and have many years' experience battling with the streams which often overflow and sweep fences and bridges away. Not one man of a thousand can afford to hire a pile-driver, nor if convenient to make abutments of stone would it be practicable when the floods are out. For the light traffic of farm-work and hauling on county roads, much the best way to replace the span of a bridge, up to 20 feet, is to lay a mud-sill a few feet from the bank, bedded well, and place the sills on it for the floor. If the water is likely to overflow the bridge, then bolt the floor-sills down and spike the plank. This makes a bridge, my word for it, that will stand "from the first of June till the falls of the Ohio," if well located. One of the cuts shows the ground plan ready for planking; the other figure is a side view of stream and bridge completed, and no further description is needed.

It will cost Sonoma county a quarter of a million, out of the treasury, with private labor to make good the damaged roads and bridges. There will be running and fetching, and taxing and spending, all over California for the next six months to put the highways in shape. A great part of this under-intelligent management can be saved. Somebody will ask how? For answer, let me inquire of the reader if he ever noticed the water at work undermining a stone abutment? The first job the element undertakes is to get behind it, to bore the bank and gnaw at the revetment of timbers that sometimes are placed for protection. When it comes with the speed of wild horses in flight, from 5 to 50 feet deep, the power is irresistible. It is apt to "get there" every time; piles, masonry and cast-iron piers notwithstanding. Once let the band of man put a structure in reach, and it seems to set to work

A Test of Steel Ties.

Some time ago some of the railroad companies in the East determined to test steel ties as a substitute for wooden ones. John W. Clarke, roadmaster of the Chicago & Western Indiana Railroad Company and the Belt Railway Co. of Chicago, in the latter part of January made the following report in relation to the ties of steel that were laid on a part of the system over which he has control:

I beg to say that steel ties were laid on the 1st of October, 1889; and, as you are aware, they were put in at the above location on the south-bound track for the reason that at this point the ballast is very light gravel, which would make the test much more severe than if they had been put in at another location of the road. The traffic on this section is eighty regular trains in one direction every 24 hours, the heaviest engine being 96,000 pounds, with 15,000 pounds on each pair of drivers. So far the ties have given perfect satisfaction, requiring but slight attention, and that only when first laid. There are no loose bolts, clips or nuts, and so far have been none. It would be impossible for me to estimate correctly at the present time the saving in maintenance, as the ties have not been in service long enough. I believe, however, that there will be a great saving in maintenance, as the only thing to need attention is the bolts and clips, and so far they have shown no indication of weakness in any particular. There has been no upheaval of the ties where the ground is frozen, and from present indications I hardly believe that such will occur. The ties are in good line and surface, and hold the rails in an upright rigid position, so that the wear on the rail-head seems to be more uniform and even than where wood ties are used. I am free to say that the ties have so far surpassed all my expectations. There seems to be no possibility of spreading of the rails. Should a rail break, there would be less liability to accident, for the reason that the fastenings hold the rails absolutely firm and rigid. I believe that the saving in maintenance that will eventually be shown, and the absolutely safe permanent way which these ties make, to say nothing of their greater life, will show greatly in their favor.

CALIFORNIA HISTORICAL SOCIETY.—At a meeting of the California Historical Society, held Saturday afternoon, the following named were elected as officers for the ensuing year: J. R. Jarboe, president; George Davidson, William Norris and A. Varsi, vice-presidents; James A. Donahoe, treasurer; A. S. Hubbard, secretary; Committee on Publication—John T. Doyle, William Cary Jones and William Norris. These three last-named gentlemen will, with Horace Davis, J. V. Coffee, E. R. Taylor, R. C. Harrison and Bernard Moses, also constitute the Board of Directors.

A LEONARD DAY'S LABOR.—T. H. Cox, who worked for the Central Street Railway Company of Sacramento for 90 days as a driver and conductor, has sued the company to recover \$45 alleged to be due him for overtime. He worked 14 hours a day, and bases his action upon an Act of the Legislature, adopted March 11, 1887, providing that 12 hours a day shall constitute a statutory limit. This will be the first test of the law, and if Cox succeeds in winning his suit it will in all likelihood involve a majority of railroad companies in the State.

TO MEND RUBBER BOOTS.—The following is said to be a good way to repair rubber boots: Dissolve small pieces of rubber, not vulcanized, in warm spirits of turpentine to the consistency of thin molasses. Rub the patch and boot thoroughly with sharp sandpaper. Smear both with liquid rubber five times, letting them dry each time. At the sixth application, apply the patch with strong pressure to the boot and it is mended.

SOUTH AFRICA.—"A stampede is being made to Witwatersrand, South Africa, rivaling, it is said, the old days of '49, when the gold fever raged in California. During the past year no fewer than 1500 stamps have been laid down at Witwatersrand, thus bringing the total number up to 2000." The above statement was made by "promoters" for the sale of mining property in that district. The total number of stamps there does not exceed 750.

A CREMATORY.—The Board of Directors of the San Francisco Cremation Company will soon commence the erection of a crematory on their lot, situated on the northeast corner of California street and Laurel avenue. They have issued a circular to the public announcing their determination to commence business in the near future, setting forth their aim and object, and soliciting aid to carry out their undertaking.

THE property of the Baltimore M. Co. on American Flat has been attached by the Sheriff as security for payment of \$3028 due on a promissory note drawn in favor of Jacob Birtz of San Francisco.

THE Red Cloud group of mines, Wood River, Idaho, was sold for \$250,000, last week, to Standard Oil Co. men.

THE supply of skilled miners at Butte, Montana, is reported as being in excess of the demand.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, Feb. 23: The afternoon shift on repairing to the mine last Saturday, on learning that they could not get their pay that day as they had been led to expect, refused to go to work, and returned to their homes. The other shifts followed suit. No work has been done around the mine since, except keeping the water out. Work on the car-track to the mill has also come to a standstill. Some 80 hands are thus brought to temporary idleness. This hitch is generally attributed to some misunderstanding among the stockholders. Since the above was written, the difficulties among the stockholders have been settled. The men were promised one month's wages to-day, Saturday; those who wanted to quit to be paid in full. It is also understood that a change of superintendent will take place the first of next month. John I. Minear will retire, and a gentleman now in Oklahoma, whose name we have not been able to get, will succeed him. The miners will go to work again in a few days, by the first of the month at the farthest. Mr. Sutherland, a mining expert who was sent out to report upon the property, made a thorough examination of the underground works last week, and was highly pleased with everything. In fact, the mine far exceeded his expectations, and his opinion is that there is a great future before it. He left with the other parties for San Francisco on Tuesday morning.

KEYSTONE.—Although but little is said about the improved prospects of the Keystone, the idea being to keep the matter as quiet as possible, there is no doubt about the fact of a valuable strike being made on the 1,400-foot level of this mine. The new ore body is said to be from 14 to 16 feet wide, a large portion of it being of excellent grade. The strike has been made at the south end of the claim, toward the boundary line of the South Spring Hill mine. They are still crosscutting west in the belief that still another ledge exists in that direction. Report says that the mill is to be started to its full capacity next month. The flow of water in the mine has moderated since the heavy storms of last month, and is now within easy control.

NEW LONDON.—The new mill had been running but a few hours when an examination of the plates revealed the gratifying fact that the rock was yielding handsomely. Everything points to this property at once taking its place among the steady gold producers of the county. It will do a good deal to relieve the dullness of Plymouth, incident to the shutting down of the town's mainstay of support—the Plymouth Consolidated mines.

MCKENZIE.—The prospects of this property have vastly improved. After a run of two weeks the cleanup this week yielded more than the output of any two months since the mine has been started. The ore now in sight is very rich. Some samples show free gold in considerable quantity. The mill was brought to a standstill early in the week, owing to the ditch having been choked up with snow. It will be started again as soon as the weather moderates.

Calaveras.

RICH GRAVEL.—*Prospect*, Feb. 22: It is reported that there is eight feet of gravel in the Union Shaft mine, and free gold can be seen all through it.

Inyo.

ARGUS RANGE MINES.—*Independent*, Feb. 21: Frank Bennett, an old-time prospector, has located 53 mining claims in the Argus Range in the neighborhood of the Haggin mine and the Riley mill. Last Sunday he went into Mojave with a wagon-load of samples of ore from 15 of the claims. The ore was sent to San Francisco to be worked for a test. Recently several parties from Los Angeles went to the district with Bennett and examined the claims. He bonded several of the mines to these parties. He says these men will put up a mill at a point convenient to the mines and will give miners a privilege to work any of the claims for a term of two or three years, and the miners have the entire proceeds for developing the mines. Bennett says men who will work can make good wages from the start. The business men of Los Angeles appear very willing and anxious to help develop the mining resources of Inyo county.

BORAX.—There are five teams engaged in hauling borax from the works in Sline valley to the railroad; two belonging to Schober and one each to Marshall, Hall and Smith. They have been hung up during the past week because of snow.

Placer.

ECLIPSE.—*Placer Herald*, Feb. 22: The Eclipse mill will be running next week. The battery and the ore-bin are in place and all that remains to be done is to put in the grizzlies. A large quantity of ore has been taken out. This ore prospects very well.

SUNNY SOUTH.—*Placer Argus*, Feb. 22: H. T. Power came down from Sunny South, Monday, to look after the Burnham estate, of which he was appointed executor. He says they have been working only about half the usual force for some time, in the Hidden Treasure mine, but will put on the full force as soon as the weather clears up, and he hopes for good returns.

MAYFLOWER.—F. Chappell's resignation of his position as superintendent of the Mayflower mine has finally been accepted. Mr. Chappell's health is not the best, and he will have a needed respite. Mr. Beach, who has acted as assistant, will take Mr. Chappell's place for the present.

Shasta.

RICH ROCK.—*Redding Free Press*, Feb. 22: This week a rich strike is reported in the Hart & Day mine, at Old Diggings, at a depth of 500 feet. The rock is said to be very rich, and this depth indicates that the mine is a valuable one. A good deal of work has been done on this mine, but until lately it has been of a superficial character.

San Diego.

THE COLORADO PLACERS.—*Yuma Times*, Feb. 20: From Mr. Thomas E. Fraser of the Colorado River Placer Co., we learn that the reported permanent suspension of work at the Pot-holes is false in every particular. The cessation of work will not ex-

ceed ten days at the longest. The present manager, Mr. Jackson, has disposed of the major portion of his interest to California parties who will energetically prosecute developments. A stockholders' meeting will take place on Friday next, when plans for more extensive operations than have been accomplished heretofore will be discussed and adopted. A bright future is in store for the company.

Siskiyou.

SALMON RIVER.—*Cor. Yreka Journal*, Feb. 15: Six miles above the town of Sawyer's Bar, the Harris brothers have been industriously engaged in hydraulic mining for a number of years. They were not possessed of means to purchase improved machinery or dig long ditches to bring a big supply of water to their ground. Last fall an agent for the Tioga company of San Francisco came and viewed and prospected the gravel, and made them an offer to bond the claim for one year, for \$30,000. This proposal they accepted. The company intend to commence work in the spring, by digging a ditch four miles in length, and shipping giants and everything necessary to work the claim in a rapid manner. The agent gave it as his opinion that the gravel would yield \$10,000 to the acre. The Gold Hill hydraulic mine, owned by Wm. E. Kline, is one of the best paying properties on Salmon river. It is close to town on the opposite side of the river, and has been worked in a limited manner for 8 or 10 years. The former owners for some reason were unable to make it pay. The supply of water to work this claim is obtained from Jessup's gulch. Kline became the owner, and went to work with a vim. Last season was a very dry one, and he had water only two months, yet he took out over \$1200. He has built two large reservoirs in which to store the water, run a low bedrock cut to open his ground from the lower end, and has everything in good shape for the coming season. Three miles down the river, on Steamboat flat, is a hydraulic mine owned by the Hickey brothers. Their claim is rigged with all the modern improvements, and when worked pays well. They obtain water from Shelatue's gulch, which affords a head for 3 or 4 months, on an average. Last fall they rigged up a river claim, opened a cut and performed considerable work, but did not reach bedrock before the storms set in, so they postponed work until next summer. The richest and most extensive hydraulic mines of the North Fork of Salmon river are situated five miles below Sawyer's Bar, and owned by Abraham Ahlgren, a Russian citizen of the United States. One of the claims is known as the Red Hill and the amount of dust it has produced would load a pack mule. It still pays well, but will be long worked out. Below the Red Hill is his lower claim, and at the present, and for some years past, the most remunerative in this section. From \$600 to \$1000 per week has been cleaned up for a week's run. He employs from 8 to 10 men when both claims are in operation. He has the best water right on Salmon river, which affords water for 10 months in a year on an average, and is taken from the Little North Fork.

Tuolumne.

SAN GIUSEPPE MINE.—*Sonora Democrat*, Feb. 22: This mine, located within the limits of the town of Sonora, has been sold to San Francisco parties, represented by W. G. Whorl, who is now here and who will have charge of the mine. The mine is regarded by those who have followed its development as a valuable property, and the results of all the ore worked in the mill prove this opinion to be well founded. It is a peculiar mine in some respects, for it is essentially a sulphuretted mine, containing very little free gold. The bullion is of unusually high fineness, reaching \$20.48 per ounce, \$20.67 being chemically pure gold, and those who know whereof they speak say there are only two other known mines that produce bullion of such great fineness. The sulphurets are of extremely high grade, having average value of \$580 per ton. The mine will be vigorously worked by the new ownership.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Virginia Chronicle*, Feb. 23: On the 630 level are cutting out a shaft station.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, an east crosscut is advanced 46 feet in porphyry.

MEXICAN.—On the 1465 level, west crosscut No. 3, 100 feet south of No. 2, the north drift from west crosscut No. 1, from the main north lateral drift, is extended 84 feet, continuing in a porphyry formation.

OPHIR.—On the 1300 level from the end of the east crosscut No. 5 in the shaft station, a south drift is advanced 395 feet, from the end of the east crosscut, 316 feet from the shaft station, continuing in porphyry and quartz.

CON. CAL. & VA.—The 1300, 1435, 1500 and 1600 levels continue to yield the usual quantity of ore. Shipped to the Morgan mill 1075 tons and 390 pounds of ore, and to the Eureka 1672 tons and 1970 pounds; battery sample assays showing an average value of \$27.46 per ton. Bullion valued at \$77,025.86 shipped to the Carson mill.

GOULD & CURRY.—On the 200 level from the southwest drift, at a point 335 feet from west crosscut No. 1, west crosscut No. 2 is advanced 30 feet. Formation, porphyry and quartz showing some value.

BEST & BELCHER.—On the 1000 level east crosscut No. 1 is extended 175 feet. Formation, porphyry and clay.

NORTH GOULD & CURRY AND EAST BEST & BELCHER.—Drifting west from both shafts in a favorable formation.

SAVAGE.—Shipped 340 tons of ore showing an average value of \$22.05 by battery sample assays. The falling off in ore shipments was due to a snow blockade of ore side-tracks. Raise No. 1 above the 400 level continues in fair-grade ore.

HALE & NORCROSS.—Shipped during the week 200 tons of ore, showing a value of \$20.75 per ton by pulp assays. Ore shipments were suspended during past five days on account of snow on the ore side-track leading to the Nevada mill.

CHOLLAR.—During the past week crushed 400 tons of ore, pulp assays showing an average value of \$20.87 per ton.

POTOST.—The 930 level east crosscut continues in quartz and porphyry.

ANODES.—Finished cleaning middle compartment of main shaft. Now sinking sump preparatory to drifting on 420 level.

IMPERIAL.—The 300 level west crosscut, No. 2, is still in porphyry. The 500 level west crosscut continues in quartz. The 500 level north drift is out 1390 feet from the Yellow Jacket shaft. But little progress was made in explorations the past week on account of break in Yellow Jacket air compressor.

ALPHA.—The 600 north drift is in quartz. The 500 level west crosscut has entered a favorable vein formation.

EXCHEQUER.—The 500 level line east crosscut is in quartz showing value.

OVERMAN.—Ore shipments, suspended during the week on account of blockade of ore side-tracks, will be resumed next week.

CALEONIA.—West crosscut No. 3 has entered low-grade ore.

YELLOW JACKET.—Ore shipments and underground work suspended two days during the week on account of break in air compressor. Explorations and shipments resumed to day.

CROWN POINT.—Shipped during the week 150 tons of ore showing an average value of \$18.50 per ton by pulp assays. Falling off below usual average was due to snow blockade.

BELCHER.—The 850 level east crosscut is in low-grade quartz and porphyry. The 200 level south drift is in porphyry. The 600 south drift is showing some quartz and clay.

SEG. BELCHER.—The 1200 north drift from the mine is stripping ore of fair grade.

JUSTICE.—During the week crushed 215 tons of ore of the usual average assay value.

ALTA.—Crushed 310 tons of ore during the week, battery samples showing an average assay value of \$24.75 per ton.

UTAH.—On the 600 level the southeast drift from the shaft station is extended 937 feet. Formation, soft porphyry, clay and quartz.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the 400 and 450 levels. The raise 100 feet south of No. 3 raise is up 25 feet and continues in fair quality ore. The 550 line east crosscut is advanced 10 feet in porphyry and clay. A south drift from the end of the line west crosscut is extended seven feet in porphyry and quartz showing value.

NORTH OCCIDENTAL.—The 550 level joint east crosscut is extended to feet in porphyry and clay. The north drift from the line west crosscut is extended nine feet in porphyry and quartz showing value.

Aurum District.

BULLION PROCUING.—White Pine News, Feb. 15: The Davis & Sanford property has been a bullion-producing and paying property for several years. The owners—Simon Davis and Ben Sanford—have been shipping their rich ore to Salt Lake and storing their lower grade at the mine. If the property, which has shown itself to be valuable, is not sold, the owners will put up a mill themselves.

Cherry Creek District.

BRIGHTER PROSPECTS.—White Pine News, Feb. 15: Cherry Creek, which in the past seven years, through the malpractice of her mining doctors, has received more black eyes and foul "under the belt" blows than a fighter in a prize-ring, is manfully battling the odds against her, and though recently sent to "grass" by a legal knockout, her people write us she will come to the "scratch" again in the spring and renew the struggle with brighter prospects of success. Cherry has by far the best defined mineral ledges of any camp in the county.

Eureka District.

FURNACES.—Eureka Sentinel, Feb. 15: Eureka con. furnace No. 1 is being fitted up. Both furnaces will be ready for use by the time that the company will be ready to resume smelting, which, probably, will not be before the 1st of April.

Granite District.

GOLD.—White Pine News, Feb. 15: A report reaches us from down the valley that a rich strike of gold ore has been made in the south end of Granite. Wm. Dodd, J. L. Miles, Geo. P. Holmes and W. D. Campbell are said to be the lucky owners.

Oscola District.

PLACERS.—White Pine News, Feb. 15: As soon as spring opens the Oscola Gravel M. Co., with a full head of water, will tear up the ground at a lively rate and produce the coming season a rich golden harvest. Its operations will materially aid every industry in the eastern portion of the county.

Patterson District.

RUBIES.—*Pioche Record*, Feb. 23: But little prospecting has been done in the northern part of Lincoln county, yet there is no doubt that the mineral resources of this section are both varied and extensive; ores of gold, silver, lead, copper and cobalt have been found, and the thorough prospecting that will follow the coming mining revival will bring this part of the county into prominence as an ore-producer. A curiosity in its way and showing the lavish hand with which Nature has bestowed her treasures on this region is a veritable mountain of rubies. The formation, which is much worn and seamed by melting snows, is a bluish-gray porphyry thickly studded with fragments of jet and small rubies. The gulches radiating from and around this mountain hold millions of these beautiful little jewels too small probably to be of commercial value, but of first quality. Further prospecting may develop them of larger size, as only a passing examination has been made.

Robinson District.

PROSPECTING.—White Pine News, Feb. 15: The impetus given to prospecting in this district by the discovery last fall of the now famous Joanna Bonanza is already proving beyond a doubt that great mineral wealth lies hidden in the vast mineral zone of Robinson District, waiting only for capital and enterprise to yield up the treasure. From several prospecting mines outside of the Joanna, come very flattering reports of rich strikes, on which the hardy prospectors are pushing ahead, and, in all probability, before mid-summer some of these are likely to develop into just as valuable properties as the Joanna. The great extent and varied mineral deposits of this district, which have so long lain latent, have aroused so confident a feeling of intrinsic worth both at home and abroad that the operations of the present year are certain to show up and bring to the front two or three—may be half-a-dozen—twin sisters of the mine whose fame has brought the district into prominence. The gold is here, and the men

who are delving for it will find it, and when found capital will seek investment if the mine-owners meet them on a fair business plane. It cannot be denied that the present need of the district is a company with capital to build reduction works and push the work of mining development on a larger scale than can be done with the limited means at the command of the present owners. One good company operating in the district would in one year do more to develop its resources than can be done in half a century under the present methods.

Taylor District.

PROSPECTING.—White Pine News, Feb. 15: While the Eberhardt-Monitor Company has been forced to suspend milling operations for the winter, quite a force has been kept in the mines taking out ore and prospecting, and in the latter, we learn, they are meeting with good success. As they will have plenty of water the coming season to keep the mill running to its full capacity, the season will be a prosperous one with them.

Tuscarora District.

NAVAJO.—*Times-Review*, Feb. 21: Upraise from south drift, 150-foot level, extended 11 feet; vein continues strong. No. 2 west crosscut, 350-foot level, extended 21 feet, cutting seams of spar.

YOUNG AMERICA SOUTH.—Timbering was the only work done during the past week. The mine is filling rapidly from the melting snow. No more work will be done in the mine until machinery has been erected.

BELLE ISLE.—Crosscut from north drift, 250-foot level, near the Navajo line, extended 22 feet; ground seamed with spar and some iron. The crosscut from the north gangway, 350-foot level, extended 18 feet with quite a flow of water near the face.

NEVADA QUEEN.—The north gangway from 600-foot level station has been advanced 21 feet, cutting the vein. A large flow of water is coming in through the face. Face shows high-grade ore.

GRANO PRIZE.—400-foot level: North crosscut extended 12 feet. 500-foot level: East drift from north crosscut extended 18 feet, face showing 2 feet of concentrating ore. A north crosscut has been started from the west north lateral drift. A crosscut has also been started north from the east drift on the front vein.

NORTH COMMONWEALTH.—1st level: North drift from No. 1 east crosscut has been advanced 10 feet. Have cut into the ore from No. 1 upraise 60 feet from the raise, assays from \$70 to \$287 per ton. Drift running south from near the Del Monte line is exposing fine ore full size of drift, average \$309 per ton.

DEL MONTE.—1st level: North drift from joint crosscut has been extended 5 feet; face shows all high grade. This is the same ore body as North Commonwealth drift. Average, \$250 per ton. North drift from No. 2 crosscut advanced 8 feet. The ore is improving as it is drifted on; average of first-class, \$420 per ton, 3d level: North drift from joint crosscut has been extended 13 feet; face is in low-grade ore.

NORTH BELLE ISLE.—South intermediate drift from No. 3 chute, 300-foot level, extended 6 feet; face still in good ore. North gangway from shaft, 600-foot level, extended 21 feet, cutting into ledge some 20 feet, and showing a large amount of quartz and spar, from which assays may be obtained as high as \$450. Water increasing.

COMMONWEALTH.—1st level: East drift from No. 1 north drift has been extended 11 feet; total, 72 feet. The ore body continues to develop well. The Dolan drift advanced 14 feet in concentrating ore. North gangway has advanced 20 feet in vein porphyry. North drift from south gangway advanced 6 feet, cutting some high-grade ore, improving in quantity as we drift on it. The mine is looking well throughout. Hoisted during the week 813 cars of ore, all of which has been sent to the mill and concentrator. Average battery of 151 tons crushed, \$266 per ton; average of 500 tons worked at concentrating plant, \$21 per ton. Bullion shipped, \$16,042.25. Crude bullion on hand, \$17,000.

Ward District.

MARTIN WHITE.—White Pine News, Feb. 15: The Martin White Co. have a few men prospecting their mines. If they find anything good, the force will be increased in the spring.

Whites Pine District.

ONTARIO.—White Pine News, Feb. 15: In the Ontario mine, one of the Watson series in this district, which is under lease to Mr. Norton, a rich strike has been made. Ore that goes between \$60 and \$70 in gold and carries some silver is now being taken out. Mr. Norton has put three or four men to work. As soon as the roads get in good condition, considerable ore, which has accumulated here during the winter, will be shipped by our prospectors to Salt Lake and other points for reduction.

AROUND HAMILTON.—White Pine News, Feb. 15: No corporate work is now going on, nor do we hear of any likely to resume operations there the coming season, but the old stand-by prospectors of the district, who have never faltered in their faith in the camp, are doing a good deal of chloriding and shipping rich ore for reduction. These are the men who are keeping the embers of hope burning in the old camp still.

ARIZONA.

A STRIKE IN THE OLIVE.—*Virginia Chronicle*, Feb. 23: Washington camp, in Arizona, 18 miles south of Cripple Creek and five miles north of the Sonora line, in the Patagonia mountains, is now a scene of some excitement, owing to a rich strike of ore in the Olive mine, near the old Mowry smelter. When the Mowry works were closed down in 1863, an old Mexican miner reported that ore was left in one of the shafts that would run 1500 or 2000 ounces in silver. On the strength of this report numbers of different parties have sought in vain to strike it, but have successively failed. Within the last two years one party spent over \$2000 in search of the rich ore referred to by the old Mexican miner. It is believed the vein has at last been found in this new strike. The ore runs from 300 to 2000 ounces in lead and silver, native silver abounding in large quantities. Some of the samples are so strung together with wires of native silver that it is impossible to break them. The vein is reported to be from 2 to 8 inches wide. The parties who made the strike are Nicholas Carr and Frank Olsen.

CUPEL.—*Mobave Miner*, Feb. 22: The Cupel mine, Stockton, is producing the usual quantity of good ore. The last ore body has produced over

2000 sacks to date, with a considerable stoep to bear from.

LEAD ORE.—M. P. Delhanty sent in the first half of a 20-ton lot of lead ore from the Schuykill mine, Chloride, on Thursday. It was unloaded at the Kingman Sampling Co.'s works.

HEAVY LOAD.—The heaviest load of ore hauled from Chloride by 12 mules and 2 wagons without "dropping," came in on Thursday, 19,882 pounds. Del Bebe says he "pulled" the long hill with ease, and with three wagons he can haul a carload.

PURCHASE.—It is stated on reliable authority that the O. K. Mining Co. have purchased the Monarch Mining Co.'s mill at Gold Basin, and will move it to the O. K. mine, where they have succeeded in finding an abundance of water.

C. O. D.—E. F. Thompson and W. A. Watkins have leased the C. O. D. dump. This dump is quite vast and contains much good ore, and the problem of how to cheapest assort and save it will soon be solved by Messrs. Thompson & Watkins, who immediately put a force to work.

GALENA.—Messrs. Lynch & Larkin, proprietors of the Arizona Sampling Works, have a force of men at work on the Little Man mine, a property they recently purchased from John Crawford and John Mulligan. There is plenty of galena in sight and Messrs. Lynch & Larkin expect to extract a good many tons of ore per month after this (February), which will be consumed in putting things in shape for active operations.

A MILL.—W. B. Campbell came in from his mine near Cerbat, on Wednesday, and reports the ore as growing richer and the vein wider as development goes on. No more ore will be worked by assatta for the present, but Mr. Campbell intends to soon make a shipment or lease a mill and work it himself, as the gold is very free and easily amalgamated. The vein is seven feet wide and shows free gold the entire width, while there are five streaks from one to three inches wide which are very rich. No drifting has as yet been done and the extent of the ore body is unknown.

MUSIC MOUNTAIN.—W. F. Grounds showed us the returns of a batch of ore from Music Mountain which worked over \$1000 gold per ton at the Kingman Sampling Co. Mr. Grounds has a carload, which is now being sampled at the above works, but, of course, will not prove so high grade as the first-class. Mr. Grounds thinks it will be but a few months, at least, before there will be a mill there for the reduction of ore, as the development work has proven there are large quantities of \$50 to \$60 free gold ore, which must be milled in that district, as shipping charges consume the miners' profit. There are at present some 15 men working and all doing well, in fact the camp never before had one-half the flattering prospects that now present themselves.

AT QUIJOTOA.—*Suppl's Report*, Feb. 22: During the week good progress has been made in shaft No. 1 of the Peer, making total depth 53 feet, with the ore continuing very strong for more than width of bottom and of good grade. In the south drift from 100-foot level the ore continues strong and of good quality. Fair progress has been made during the week, making total length of drift 42 feet.

PEERLESS.—On the 450-foot level an east crosscut was commenced and extended 19 feet during the week, showing some strata of quartz, when work was suspended and again resumed in the north drift, which was advanced to feet, making 445 feet, without any change of importance.

CROCKER.—On the 370-foot level good progress has been made in winze No. 2, making its total depth 61 feet, with the bottom in ore of some value for width; will soon commence drifting north and south.

WELDON.—In shaft No. 1, below the 100-foot level, fair progress has been made in sinking, the formation being very hard, the vein continuing regular and showing some ore. At a depth of about 40 feet below the 100-foot level the junction with the west vein ought to be reached.

COLORADO.

IMPROVING.—*Silverton Standard*, Feb. 23: The Alethea is steadily improving. Wm. Corlett, the lessee, shipped a car of high-grade ore this week and has another all ready to get down. The mineral is taken down to the road in raw hides. Ben Harwood has a contract to take provisions up to the Lookout mine and bring down a carload of ore. The ore-house is full of mineral. The contractors on the crosscut on the Mineral Key, in Whitehead gulch, owned by Geo. Giton, have just encountered a large body of water, and expect to cut the main ore streak this week. The Little Dora, owned by the Victoria M. & Co., is looking better than ever, and a nice grade of gray copper is now being taken out. A carload was shipped yesterday to Pueblo. Wiley & Harper will commence work upon the Pearl mine about the middle of next month. The drift upon the vein, from the end of the crosscut, on the Iowa, is now in 60 feet. The gold streak still holds about the same, averaging 18 inches wide. Last week a new streak of solid steel galena was uncovered, which looks very well. This property is being worked under lease by James H. Robin and B. W. Thayer. The toboggan slide on the North Star is working to perfection and the boys are getting down about 12 tons a day. The ore is being taken about 600 feet down the bluff and being dumped on the flat above the mill. By moving this ore plenty of room will be made in the ore-houses, and the mineral moved will be in a position where the packers can remove it with one-third the trouble in the spring. Wm. Feigel, the contractor on the new mill being erected by the John H. Reid M. & Co., went to Durango Monday to get 1000 feet of lumber to complete the building and an engine stone. As soon as these arrive the mill can be completed in about two weeks.

IDAHO.

THE CRESSUS MINE.—*Wood River Times*, Feb. 19: The strike reported in the Cressus mine, a few days ago, promises to prove so important that our miners are even beginning to speak of the property as likely to prove "a second Granite mountain." The original strike was of two feet of ore on the "near" wall of the vein. Since then the workings have been pushed 25 feet, and without finding any indication of the opposite wall. These 25 feet are wholly composed of 14-gauge matter carrying streaks and veins of ore that are quite rich. The bulk of the new find is probably \$20 to \$30 ore, and therefore comes near the usual value of Cressus ore.

The Cressus mine, as is well known, is situated in Croy gulch, opposite the Hot Springs, and only about two miles from Hailey.

INCORPORATION.—*Idaho Avalanche*, Feb. 22: Supt. E. H. Dewey informs us that the Black Jack and Empire State mines have been incorporated under the laws of the State of Kentucky, the corporation's name being the Idaho & Pittsburg M. & M. Co. The houses at the mouth of the tunnel are now completed, and occupied by men working in the tunnel. The tunnel is now being driven ahead rapidly with three eight-hour shifts of men. The ground is yet soft, and good headway is being made. As soon as hard ground is reached an air compressor will be used in working Burleigh drills. The ground of the Black Jack and Empire State mines will soon be patented.

LOWER CALIFORNIA.

ALAMO DISTRICT.—*Lower Californian*, Feb. 21: Superintendent Ayers, of the International Company's mines, arrived from Alamo last Monday with \$6000 in gold bullion, which was the result of two weeks' milling on ore from the Princessa, Ulises, Telemaco and Indian. Mr. Ayers will leave by tomorrow's boat for San Diego to deposit the bullion. Since the beginning of 1890 the Co.'s mill has turned out \$7500 in gold, and it speaks well for Mr. Ayers, the superintendent, who is the first man to make a success of the Co.'s mill. He reports the camp to be in better condition than at any time since its discovery, and he is confident that many of its mines will prove to be veritable bonanzas. He is of the opinion that by the addition of concentrators the mill would be in splendid shape. On the Grande and Grandota line the International Co. is sinking, and also drifting in the tunnel between the Telemaco and Penelope, where a rich ledge has been struck. Drifting is also going on in the Princessa. A rich ledge has been struck on the Grande, one of the Co.'s mines. Major Zimlemon, of the El Paso Co., is erecting hoisting works on the Texas, and that mine will soon be in operation again. It is one of the richest in camp. The Grandota, which was reported last week to be full of water, is again in operation and ore is being constantly taken out. The Elsinore is once more working and ore is being hauled to Lane's mill. Ore from the Aurora is also being taken to Lane's mill. The placers all over the camp, and in Mexican Gulch, which were contemptuously abandoned by tenderfoot many moons ago, as being played out, are still being profitably worked, and considerable dust is found. We state this particularly for the benefit of J. P. Redmond, who declares in the Los Angeles *Express* that the placers of Lower California will not make a man's salt; that he knows, for he has worked in the placers. W. E. Howard came down from San Diego Tuesday, but returned the same evening to purchase a pump and boiler to be used at his Montezuma mine at Alamo.

MONTANA.

THE MOUNTAIN LION, after some unpleasantness with the St. Louis syndicate, has weathered through the middle or main vein, which was cut Thursday of last week. The vein is 3½ feet wide, and the assays are of unusual richness.

THE MINNEAPOLIS has been managed most consistently and has probably as fine showing as any property in Oro Fino with the same amount of development. The property now being worked is developed by a shaft 478 and is now about 70 feet deep. They have a fine ledge on which seven feet of quartz has been exposed.

UNUSUAL ACTIVITY.—*Butte Miner*, Feb. 20: The coming spring will undoubtedly be the commencement of a year of unusual activity in Montana mining circles. Already preparations are being made to resume operations at a number of promising properties in this city and vicinity in a short time. Not only is this the case with individual owners, but companies as well. Nearly all the claims within a radius of two miles of the city have in the past had more or less work done on them. The majority of these claims, however, are now lying idle because of the financial inability of the owners to prosecute work on them as it should be done. Within the past few years men who are familiar with the formation beneath have learned that a depth of at least 500 or 600 feet must be attained before a property will present a paying proposition, and in order to accomplish this end some money must necessarily be expended to start in. Many of the mine-owners here are poor men so to speak, not having more than \$50,000 or \$100,000 at their command, and do not care to take chances, while the properties owned by the large companies are being developed as they are needed. At the present stage of the game it is safe to remark that not one mine hereabout on which a depth of 600 feet has been reached has proved a failure, thus demonstrating that if the proper depth is attained on a piece of ground in this district a mine is bound to reward the efforts of the prospectors. The anticipated activity for the coming year is due to three causes—the rise in copper, the high price of silver and the knowledge mining men in general now have of the necessity of going deep enough for the ore.

PLACERS.—*Madisonian*, Feb. 22: The outlook for a good season of placer mining has not been better for several years than it is now. The deep snow in the mountains has drifted into the ravines by heavy winds, and is stored there to stay until the time arrives when it will do the most good in ground-sluicing, etc.

OREGON.

GRANT'S PASS.—*Cor. Rogue River Courier*, Feb. 20: There are several discoveries of croppings of galena and galena sulphurets that are very promising; and I have examined several specimens of silver ores, carrying chlorides and copper-stain that were very rich. From reliable reports there are some large lodes of these ores, prospected and partly developed. I have also noticed that nearly all of the gold-bearing quartz carries a large percentage of sulphurets carrying gold. Now all these facts, if generally known to the mining world, should interest capital in erecting a plant for sampling, milling and smelting works, more profitable than at any other point in Oregon. It is well known that in many parts of California there are many mines rich in chlorides that would be of immense value if the galena mines or the fluxes were at hand necessary

to work them. Many miles of the mountain ranges in Shasta county, Cal., are of iron formation, carrying a low grade of silver ores, especially those of Iron Mountain mine, that would be very valuable if there were galena mines near by so that ores could be mixed and smelted. Now you have here, around and near Grant's Pass, the mines, the smelting ores and all the fluxes necessary to work them, and a company should be formed to start milling and sampling works to develop these vast deposits of wealth.

WASHINGTON.

THE SILVER DUMP.—*Ellensburg Capital*, Feb. 20: During the past week, E. E. Gooding of Roslyn, president of the Silver Dump Mining Co., was in the city in the interest of his company. He carried some samples of ore from the mine that assay very high in silver, and which indicate that the vein is very rich. A tunnel is in 18 feet, in first-class ore. A shaft will be sunk soon on the vein, which crops out on the surface. At the depth of 100 feet a drift will be run each way on the vein. A wagon-road passes near by, and the mine is very accessible. The company intends to push work on the mine as soon as spring opens, as they think they have a valuable property and are anxious to realize on it.

NEW MEXICO.

RUBY.—*Silver City Enterprise*, Feb. 21: W. C. Tonkin is in with a car of ore from the Ruby, which will be shipped to Socorro. It will average about \$700 per ton. Hand and Casey are prospecting at Cow Springs, and are taking out some very rich ore. Kerr and Mitchell, in the same district, are doing well with their lease. The Surprise mine, Cook's Peak district, has been sold by Col. Carpenter to the El Paso Smelting Co. The mine was owned by Frank Graham and the Crawford estate. Three silver bricks, worth \$1000 each, were shipped from the Little Fanny last week. Fred Risque, the new manager of the Pacific Mining Co., arrived from St. Louis last week, and has been busy investigating the affairs of the company since his arrival. John A. Miller is making a pronounced success of the Nugget, as the frequent shipments of bullion through this city will attest. The mine is certainly paying a handsome profit above expenses, and the property is opening up in such shape as to at once place it in the front rank. What Grant county needs is more mines like the Nugget, and more men with nerve enough to open them up and put them on a paying basis.

Notes of Recent Patents.

Among the patents recently obtained through Dwyer & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

JOURNAL-BOX PROTECTOR.—Henry S. Pugley, Oakland. No. 421,610. Dated Feb. 18, 1890. This invention relates to axle or journal-boxes, especially those which are used in railroad construction. The object of this invention is to protect the inner end of the box so as to prevent the oil or grease from escaping and the dust from entering.

HAIR RESTORER.—W. L. Crooks, Sonoma, and Thimotha Robin, S. F. No. 421,675. Dated Feb. 18, 1890. This is a composition to be used as a hair restorer, composed of beef gall combined with coal tar, soft soap, washing soda, beef grease and water in certain proportions.

STEERING-WHEEL CARRIAGE.—Daniel Beet, San Leandro. No. 421,884. Dated Feb. 18, 1890. The invention relates to the class of steering apparatus specially applicable for road locomotives, traction engines and similar heavy vehicles. The object is to provide a simple and effective steering-wheel carriage, which can be operated easily and with the least amount of friction, at the same time being steady in its action and durable.

ROTARY JOINT.—Wm. F. Bowers, S. F. No. 421,657. Dated Feb. 18, 1890. The object of this invention is to make a tight rotary joint which may be applied to any mechanism where such joint is required. It is especially applicable to forming the necessary steam-tight joint between the steam supply-pipes and the rolls of a calendering machine. It is also applicable to those hose-reels wherein water is admitted to the rotary shaft of the reel on which the hose is wound and with which it communicates, this joint forming the necessary water-tight connection between the supply-pipe and the reel-shaft.

RAISIN-GRADER.—James Porteous, Fresno. No. 421,881. Dated Feb. 18, 1890. This is one of that class of graders for raisins, grapes and other similar materials in which the fruit is fed down from a suitable chute upon an inclined directing board, adjustable to various inclinations, and thence upon a series of shaking screens or sieves, a blast of air being directed on to the board whereby the stems are blown out and the fruit falls back down the board upon the sieves. The object of the improvement in the directing board is to render the cleaning portion of the machine more sensitive and accurate in its operation, adapting it to be adjusted so as to be easily regulated to the peculiar condition of the material passing through.

AXLE LUBRICATOR.—Robert H. Parker, Carson City, Nev. No. 421,886. Dated Feb. 18, 1890. This relates to a device for lubricating the axles of wagons, and it is especially adapted for use upon heavy freight-wagons where it is difficult to remove the wheels for this purpose. It consists of a V-shaped tank fitted into the space between two of the spokes and against the periphery of the hub, and in con-

nection therewith of a pipe and stop-cock and a connection between the same and the interior of the axle-hub. A sufficient quantity of lubricant can be placed in the chamber, or tank, to last a long time, and whenever it is desired to lubricate the axle the stop-cock may be turned at a time when the containing chamber is upon the top of the hub of the wagon; then the stop-cock may be closed and the wagon allowed to go on.

SHIFTER FOR GANO-EDGERS.—Samuel H. Pratt, Brownville, Yuba Co. No. 421,609. Dated Feb. 18, 1890. The essential object of this invention is to provide simple and effective means for shifting any one or more of the saws at the same time and independently of each other.

WHIFFLETREE CONNECTION.—Oliver J. Fisk, Coulterville, Mariposa Co. No. 421,880. Dated Feb. 18, 1890. This is a novel bracket for connecting the single with the doubletree; and there are novel hooks in the end of the singletree for receiving the tngs or braces. The object of the invention is to provide a simple and durable connection between the singletree and the doubletrees, which will enable the former to have a movement entirely free and independent of the latter without interference with it, so as to avoid chafing and being held securely in place.

VISUAL ANNUNCIATOR FOR CALL BOXES.—Paul Seiler, S. F. No. 421,882. Dated Feb. 18, 1890. This invention relates to an annunciator for fire, police and messenger call-boxes; and its object is to announce that the call has been received at the central station in a manner that can be readily understood and not mistaken. The improvement consists in the employment of a visible annunciator or indicator so that the return call or answer from the central office is visible to the eye and the operator does not depend upon the bell or the clicking of an armature. It consists of the setting and tripping device, the latter being operated only after the clockwork has ceased its operation.

GUIDING ATTACHMENT FOR AGRICULTURAL IMPLEMENTS.—Cyrus Packard, Fresno. No. 421,885. Dated Feb. 18, 1890. This is an attachment to plows, harrows, and similar implements, the object of which is to properly guide, direct or steer them. It consists of peculiarly formed guide-arms, which in operation enter the ground to the proper depth, according to adjustment, and guide the cultivator or other implement to the line of travel, preventing it from jumping about and injuring the trees or vines of an orchard or vineyard.

MIXING APPARATUS.—Geo. W. Swan, S. F., assignor of one-fourth to Warren B. Ewer. No. 421,883. Dated Feb. 18, 1890. This is an apparatus for mixing substances having a wide range of volatility. It is especially intended to mix the materials which are employed to form a paint or covering compound, which consists of a mixture of benzine with a paraffin or with the residue which is left after the distillation of the lighter hydrocarbons from crude petroleum. It is necessary in mixing these ingredients to mix at a temperature which is sufficient to melt the paraffin or resins, and it will be manifest that under ordinary conditions it will be impossible to mix the volatile benzine with the heavy and highly-heated solid material, because the benzine will be evaporated and driven off before it is possible to make the mixture. This invention is designed to overcome this difficulty by providing a closed tank or chamber with means for melting the solid material and maintaining it in a melted condition, a means for introducing the benzine and incorporating it with this material, a means for conveying away and condensing that portion of the benzine which is volatilized during the process, and also a means for cooling the upper portion of the chamber, to prevent a too rapid volatilization of the benzine after the mixing is completed.

SAWDUST BURNER.—Frederick W. Cook, S. F. No. 421,555. Dated Feb. 18, 1890. This is a burner for disposing of sawdust and other refuse. It consists in a fire wall, preferably in the form of a semi-circle and partially inclosing a space within which the sawdust is fed, and in connection with said wall a blast-pipe with connected flue under the charge of sawdust and provided with backwardly directed exit apertures, whereby the flue is prevented from becoming clogged and the wall is not subjected to intense heat. The invention further consists in connection with the said wall and blast apparatus, of a carrier for conveying the sawdust to the top of the wall and a chute for depositing it within the space partially inclosed by the wall.

List of U. S. Patents for Pacific Coast Inventors.

The following brief list by telegraph, for Feb. 25, will appear more complete on receipt of mail advices:
